Can be driven over two or more wires without danger of causing a ground or cross. Bare metal does not come in contact with the wires. The only practical staple on the market and the best for every purpose.

A Meeting of Wisconsin Independents

THE annual convention of the Wisconsin Independent telephone men was called to order at Madison early in March. This convention was for the continuation of proceedings begun at the January meeting, which was adjourned to await the completion of district organizations. Reports from the presidents of the different district associations were presented as soon as President Valentine had called the delegates to order.

Mr. Mohlenpah, president of the first district, reported a meeting of fifteen companies having been held at Janesville. Delegates were present representing 700 telephones, outside of Racine, in the first district. They organized with by-laws similar to those of Indiana District Associations, with some changes. They will continue to work on the map and statistics, which are now well under way. A committee on toll line connections was appointed, and Mr. F. C. Grant, of Janesville, was elected secretary and treasurer.

Mr. John S. Donald, president of the second district, reported on the same lines. His district represents fourteen companies with 27,500 telephones. Their organization was completed on March 7th, and the map committee has already nearly completed its work. Good feeling prevailed and a large and growing interest is shown in favor of Independent lines by the people in general throughout the district.

Mr. W. L. Burch announced he was the only one present at a district meeting called for the third district and he affiliated with the second district. He stated that the third district should combine with the second and seventh districts for practical reasons.

A Group of Members of the Wisconsin Independent Telephone Association at the Recent Convention.

Mr. E. J. Kneen, president of the seventh district, reported that its organization was perfected on March 7th; members are enthusiastic and well organized. They represent over seven thousand telephones.

Capt. John M. Baer reported for the ninth district that a meeting which was called for February 18 and 19 was adjourned to meet on March 12, on account of sickness and for business reasons. Capt. Baer reported the addition of the Waupaca exchange to his district by purchase by the Appleton company, and that he was preparing a map of the territory in the district.

Mr. E. I. Bates reported for the tenth district that a meeting had been held at which five companies were represented; by-laws were adopted, and the district permanently organized; 3,025 Independent telephones were represented in the district and conditions will be much improved. Members are preparing maps and statistics, and twelve to fifteen companies were reported ready to join the district association.

President Valentine announced that on account of illness Mr. H. D. Critchfield was unable to be present, but Mr. Chapin, of Milwaukee, a director of the Milwaukee Independent Telephone Company, was present to represent him. Mr. Chapin reported the excellent progress of the Milwaukee Independent Telephone Company's preliminary work. Through the aid of solicitors 5,200 contracts have already been obtained for telephone service, and 2,700,000 feet of conduit have been ordered shipped to Milwaukee, so that construction will begin as soon as it is physically possible.

Mr. W. J. Stadelman, the traveling secretary of the International Independent Telephone Association of America, was present and addressed the convention, giving much useful information, which was received with enthusiasm.

President Valentine then announced that proposed legislation demanded the attention of the Association. Mr. J. C. Crowley, Jr., moved that a committee of three be appointed to draft specifications covering the crossing of wire over railroad crossings (the purpose to govern the members of this Association in the construction of such lines), and that this committee be instructed to confer with the other interested persons in the matter and report on the following day. The motion was carried and the president appointed Mr. Crowley, Mr. Harper and Mr. Teasdale.

Mr. Harper moved that a committee be appointed, consisting of one from each district, to meet in the evening and arrange a uniform set of district by-laws. The president appointed on this committee Messrs. Grant, Donald, Schweizer, Crowley and Bates.

The evening meeting for the discussion of legislation was called to order by President Valentine, and a permanent committee on legislation was then appointed by the chair, with power to act. Messrs. F. C. Grant, J. C. Harper, Richard Valentine, R.

Digitized by Google

S. Donald and C. H. Schweizer are the members of this committee.

It was moved and seconded that Bill 205A, regarding the setting of poles, be referred to the legislative committee; also that Bill 298A, regarding the granting of franchises, with Bill 506A, regarding the taxing of property not used exclusively for telephone purposes, and that Bill 666A, regarding the stringing of wires and cables over private property, all be referred to the legislative committee for such action as might be necessary.

J. C. Crowley, Jr., the Newly Elected Secretary of the Wisconsin Association.

Other bills were discussed, after which the meeting was adjourned to the following day.

At the opening of the second day's session Mr. Schweizer moved that those companies represented at this meeting leave maps and data with the secretary for the use of the Milwaukee Company, and that the Milwaukee Company be asked for assurances of their immediate construction of their lines.

The committee on specifications for wires across railroads then reported recommendations by Mr. Teasdale as follows, which were adopted:

SPECIFICATIONS FOR CONSTRUCTION OF SPAN OF POLE LINE CROSSING ANY RAILROAD.

Poles.—The pole on each side of the right-of-way shall be firmly set and the two poles shall not be placed more than 125 feet apart; in case the right-of-way shall be of a greater width than 125 feet, poles shall be placed upon the right-of-way at such distance as shall not exceed the span of 125 feet.

Brackets.—Upon a pole line carrying two wires or less, a bracket may be securely fastened to the pole upon each side thereof.

Cross-arms.—Upon each pole line carrying more than two wires a standard telephone cross-arm and pins shall be securely placed upon each side of said pole, and the cross-arms shall be securely bolted together at each end.

Wires.—Each span of wire crossing the railroad shall be at least 25 feet above the top of each rail and each wire shall be securely fastened to its line insulators with tie-wires upon each double bracket or double cross-arm.

Guard Wire.—There shall also be placed a guard wire, No. 8 in size or larger, running from one end of the cross-arm over the entire lead of wires to the other end of the same cross-arm.

Mr. Donald reported for the nomination committee recommending the election of the following named gentlemen as officers of this Association for the ensuing year: President, H. D. Critchfield, Milwaukee; vice-presidents, the presidents of the district associations; secretary, J. C. Crowley, Jr., Superior; treasurer, J. S. Donald, Mt. Horeb.

The names proposed for the executive committee are: The president and secretary, ex-officio; John M. Baer, Appleton; Richard Valentine, Jr., Janesville; J. C. Harper, Madison; Dr. G. N. Hidershide, Arcadia; H. Teasdale, Sparta; Wm. Van Middleworth, Racine; W. P. Hyland, Ashland.

The election of officers aroused considerable enthusiasm, as it is looked upon as the first step toward the building up of a strong State organization which will insure a more uniform development, and closer co-operation between the existing companies. The position occupied by President Critchfield as head of the company at Milwaukee, as well as of the long distance company, makes it certain that his relations with the other members will be particularly close, so that his election gave much satisfaction. Mr. Crowley, the newly elected secretary, although a young man, has had particularly valuable telephone experience. He was with the Chicago Telephone Company from the spring of 1891 until the fall of 1894, at which time he entered the Independent field. At first he worked with his father, J. C. Crowley, Sr., who constructed the exchanges at Bloomington, Ill.; Chester, Ill.; Grand Rapids, Mich., and Charleston, S. C. In the spring of 1898 Mr. Crowley was employed by Mr. J. E. Keelyn and Mr. L. S. Tainter to look after the interests of the Wisconsin Valley Telephone Co. in Eau Claire, Wis. In 1900 he decided to move to the head of the lakes, at Superior, Wis., where he was employed by the People's Telephone Co., with which company he now holds the position of manager. Mr. Crowley has recently remodeled the entire plant, making it one of the best exchanges in the Northwest.

Committees on by-laws for the State and district associations, after the election of officers made reports which were accepted, and copies of the by-laws will soon be in the hands of members.

A resolution was adopted amending Article 7 of the by-laws by adding:

"Any individual member of an Independent operating company may become a member of the Association in the same manner as specified above, and by paying a membership fee of one dollar, and one dollar per year dues."

The secretary was then instructed to cast the ballot for a number of applications for membership in the association, and the following were duly elected members: The Milwaukee Independent Telephone Co., Milwaukee; People's Telephone Company, Superior; Pine Bluff Telephone Company, Riley; Mt. Vernon Telephone Company, Mt. Vernon; E. J. Bates, Chippewa Falls; J. C. Crowley, Jr., Superior; W. P. Hyland, Ashland; L. Richardson, Chippewa Falls; Dr. Geo. W. Hidershide, Arcadia; B. J. Anderson, Sun Prairie; H. Teasdale, Sparta; W. H. Burk, Sheboygan; Geo. Byer, Westby; W. J. Stadelman, Sioux City, Iowa.

Among the resolutions presented and adopted are the following:

Resolved by this Association, that it respectfully requests the

Capt. J. M. Baer. | Richard Valentine, Outgoing President. | W. J. Stadelman, Traveling Secretary, International Association. | W. F. Goodrich, Outgoing Secretary.

A Group of Wisconsin Boosters.

Independent Long Distance Telephone Company, now incorporated, to proceed at once with the preliminary work for the immediate installing of first-class toll lines connecting up the different Independent telephoen companies, representing more than 60,000 telephones.

Whereas, It has been reported that the Great Northern Rail-

Digitized by Google

road Company is discriminating against Independent telephone interests in Wisconsin, Minnesota and points along their system and that such discrimination is unfair, unjust and detrimental to Independent telephone interests of the United States, therefore be it

Resolved, That we protest against such discrimination and be it further

Resolved, That a copy of this resolution be furnished to the Independent telephone journals, the Independent Telephone Association of the United States, the manufacturers of Independent telephone apparatus, appurtenances and supplies, and that the said associations and manufacturers be appealed to to use their influence with said Great Northern Railroad Company to the end that they cease this discrimination, and be it further

Resolved, That a copy of this resolution be sent to the Railroad Commissioner of the States of Wisconsin and Minnesota, to Mr. J. J. Hill and to Mr. L. J. Hill of the Great Northern Railway Company.

It was then moved and carried that an assessment of one cent per unit be assessed against each company to carry on the work of the association.

Mr. W. J. Stanton, of Waterloo, Iowa, superintendent of the Corn Belt Telephone Company, addressed the convention on the subject of the Iowa Clearing House.

W. F. Goodrich was appointed trustee for the fund specified at the January meeting as an organization fund.

Mr. J. J. Nate addressed the convention on the affairs of the United States Independent Telephone Company, which are at present of much interest.

A resolution was presented thanking the retiring president and secretary for the valuable work done by them in faithfully performing their duties, and especially to thank President Valentine for his many years of service in the office of president, and this resolution was adopted by a rising vote.

A unanimous vote of thanks was also tendered to Mr. Harper for the faithful work performed by him for the Association. A vote of thanks was also tendered Mr. Harper and the Madison people for the success of this convention. Mr. Valentine then closed the convention, assured that his active work as president of the Association had not ceased until the members were prepared to carry their work to the full measure of success which seems now to be so definitely probable when the new toll lines are built.

Getting Business

By Charles H. Hood,

General Contract Agent, Home Telephone Co., Detroit, Mich.

TELEPHONE work may be disagreeable at times, but it is fascinating. The solicitor deals with every known business and residence on the globe. It requires a rare combination of qualities to bring success in this work, and the writer finds that of all the salesmen that apply for positions as solicitors, only one man in twenty can sell telephones. A successful solicitor must have backbone—a great many have wishbone where the backbone ought to be. He must be energetic, have tact, be a student of human nature and understand his part of the telephone business thoroughly. In this connection I want to say that to keep in touch with the times and up to date it is imperative that every solicitor and every employe of a telephone company or corporation should subscribe for one or more good telephone magazines. This advice is not directed to the practical men, for I cannot recall one that does not subscribe. The best solicitors we have ever employed have been devoted to their magazines. In no other way can a man or woman, in practical work or out of it, keep in touch with the rapidly advancing ideas of telephony. All of our solicitors in Detroit are subscribers to telephone magazines. I know that it helps them in "getting business," for in this line of work it is necessary to talk to get results and you cannot secure satisfactory results unless you are posted in every detail. I do not make this statement to boost the publishers, but I honestly believe that it adds a vast amount of ginger and ambition and I know that if every stockholder was a subscriber he would be a better worker.

Every company should exercise great care in selecting employes who are liable to meet and come in contact with the subscribers. They should be uniformly courteous and carry out their instructions in a pleasant and agreeable manner. Employers often spend thousands of dollars to influence the public in taking their service and are losing them through some other channel. A discourteous employe should never be tolerated. I admit there are times when we come close to the precipice, but it does no good to go over and it may hurt. I believe that every complaint should receive a personal call. A satisfied subscriber is a big asset to us and a large liability to our opponent. Harmony between the company and the public will bring great results. There are many methods of "getting business," but they are all subservient to a good solicitor. Judicious advertising is a great help to the canvasser, but with all the advertising we have done, you will remember how few came to the office to sign for a telephone. Still we believe in advertising.

I will cite a few methods used in our recent canvass in Detroit which has secured us 10,173 contracts up to February 23. Each contract is verified by mail and by a personal call. In the first place we educate our men in the art of selling telephones, for we realize that an inexperienced man will spoil twice as many as he will secure. We familiarize them with the local condition from the incorporation of the Bell Company in 1883 to date, and there is considerable local history in Detroit, as is well known.

First: The city was laid out in 21 districts and a man assigned to each one and a thorough canvass made from business to business and from house to house. This first canvass secured us 3,386 contracts.

Second: We changed all of the men to new districts and had them turn over all prospects to the succeeding solicitor in that territory. This was done by a book form of reports made in suitable size for the pocket that covered that district.

Third: We called all of the men off the field and gave each one a certain class to call on, such as clergymen, physicians, attorneys, contractors, druggists, grocers, etc.

Fourth: We gave each man a number of streets and a list of the parties that had signed on those particular streets.

Fifth: We turned them loose, go as you please, for a couple of weeks. This plan is capable of bringing in a great amount of business for a short time, but if persisted in will discourage the solicitor and subscriber. A couple of weeks on rare occasions in a large town will do no harm, for I find that they are glad to be confined to their territories after a campaign of this kind. I could go further with you in regard to the Detroit canvass, and many others, but I do not wish to tire you with detail. With an operating company there are more and varied methods in "getting business," but different conditions and districts require different methods and I hope to go into this more fully at some future time.

To show that we have the interests of outside companies as well as ours in mind, we compile lists of lost calls and calls to those who have not subscribed from our long distance tickets and use every effort to induce them to subscribe. I earnestly wish that the companies that are safely entrenched and enjoying quarterly dividends would take a friendlier interest and boost the smaller companies that have to dig down in their pockets

* Abstract from a Paper read at the Recent Michigan Convention.

Digitized by Google

each year. If they are not aided financially at least by "stretching a point" one may build three-quarters of the way to reach them if they can only build one-quarter. This is generally done or we would not have the magnificent system that we have, but it is human to forget when success is coming our way. We have adopted a method that has been in vogue for several years, and that is, to have slips printed twice a month on pay days and enclose in each employee's envelope, asking them to boost for the Contract Department where they spend their money and give us all the prospects they can.

A prospective subscriber or what we term a prospect is one who can afford telephone service and has none, and he remains on our list as a prospect until he leaves the city, dies or signs for a telephone. Tuesdays and Thursdays of each week we have a solicitors' meeting. At these meetings we discuss Bell methods and rates, the inadvisability of knocking your opponent, except as a matter of protection, merits of one system over another, class of service, equipment, composite circuits, etc. These meetings are beneficial to the men and to the company. It is a good plan to keep in touch with the solicitors personally and have each man make his report in presence of the others. A little jolly and encouragement for the successful ones seems to spur them all on to greater effort and promotes rivalry for the best results. Solicitors to be successful must be kept enthused. We instruct our men to study the requirements of subscribers and never try to induce anyone to take service which his business will not warrant or he cannot afford. It is a good idea for the Contract Agent in charge to canvass occasionally in the different districts to keep in touch with the people and their wants and in this way know the conditions that have to be met by the men. The Contract Agent should cultivate the friendship of the press, should belong to the Business Men's Association and most of the social clubs, for in no better way can he come in personal contact with the heads of the larger concerns with whom it is necessary "sooner or later" to adjust some matter of importance. To be successful, in "getting business" be thorough, be persistent. Of all the positive qualities of success *persistency* ranks the highest, for no real success has ever been attained without it. There is no successful business that was not built by persistency. Persistency has been the slogan of the Independents and see what they have accomplished.

Josh Billings expressed a very good thought in his advice to his son, which was "Konsider the postage stamp, my son, its usefulness konsists in its ability to stick to one thing until it gets there." Persistency acquires all things. By persistency the mouse gnawed in two the cable, and not only severed the cable, but accomplished a result, as many more and vastly more important results have been accomplished—by persistency. I intended to hang up the receiver at this point, but before I do I will repeat a few lines which I read recently:

"Genius, that power that dazzles mortal eyes,
Is oft but perseverance in disguise.
Continuous effort of itself implies,
In spite of countless falls, the power to rise.
'Twixt failure and success, the point so fine
Men sometimes know not when they touch the line.
Just where the pearl was waiting one more plunge,
How many a struggler has thrown up the sponge!
As the tide goes clear out, it comes clear in,
In business 'tis at times the wisest win.
And Oh! how true when clouds of doubt dismay
'Tis often darkest just before the day.
A little more persistence, courage, vim,
Success will dawn o'er fortune's golden rim.
Then take the honey for your bitterest cup,
There is no failure save in giving up.
No real fall as long as one still tries,
For seeming set-backs make the strong man wise.
There is no defeat in truth save from within,
Unless you are beaten there, you're bound to win."

Independent Company Gets Charter at Nashville

THE telephone muddle in Tennessee has reached monster proportions, with many new and interesting features. Briefly told, the situation is this:

The Home Telephone Company attempted to enter Nashville to compete with the Cumberland company, but the city council refused it a franchise. The Home company then undertook to build its lines and operate under a State law under date of 1878, which provided that a telegraph company could operate throughout the State without the authority of a city or county, and claiming to be a telegraph as well as telephone company the Home company began its work. The city council sent men out to destroy the work, whereupon the company secured an injunction against the city in the lower court. The case went to the Chancery court and the injunction was dissolved. On appeal to the Court of Appeals the company's contentions were sustained and the city enjoined from interference with the company's work. The city appealed to the Supreme Court, which decided for the city on the ground that no telephone company had ever been given authority to organize in Tennessee. Just a few days prior to this decision the Legislature passed what is known as the Talbert Bill, which gave telephone companies, as public service corporations, the right to organize, build lines and exchanges and operate in any town or city without the consent of the city. Under this law all the telephone companies in the state are re-incorporating.

Following this new law and the decision of the Supreme Court, W. B. Marr and J. B. Jones, of Nashville, the former being a member of the House of Representatives, filed an injunction suit restraining the Secretary of State from granting a charter to the Home Telephone Company on the ground that the recent law passed by the legislature was unconstitutional and passed in the interest of a certain company.

The grounds on which the new law was attacked are the following:

1. Because the Legislature has no right or power to deprive a local municipality of the right of self-government with respect to matters purely local, such as control of its streets, etc.

2. Because the control of the streets of the city was by charter vested exclusively in the city, and its charter cannot be interfered with or destroyed except by an act repealing or amending it. Further, that such control cannot be legally destroyed or affected by an act dealing alone with a form for a charter for telephone or telegraph companies.

3. That the act undertakes to give telephone or telegraph companies rights on the streets of the city without the consent of the city or its citizens, without giving the same right to other public service companies.

4. Because the bill undertakes to give telephone or telegraph companies perpetual franchises on the streets of the cities of the State without the consent of the municipal authorities, and for that reason is repugnant to the Constitution, which opposes perpetuities.

5. Because the act is void on account of having three separate and distinct subjects embraced in it; in that it contains a form for a charter for telegraph and telephone companies; it undertakes to fix rentals and give cities rights to regulate rates; and because it deprives municipalities of the right to say whether or not they want one, two or one hundred telephone companies on their streets.

6. Because the bill seeks to prevent municipalities from obtaining or even asking reasonable compensation for the right, franchise or license of telephone or telegraph companies to enter upon its streets and transact business in the city.

7. Because the act is void in not indicating in its caption the subject matter contained in the bill in that it only purports to amend a general incorporation law and gives no indication of the broad and sweeping power sought to give telephone and telegraph companies, and gives no indications of the restrictions imposed on municipalities of the destruction of the rights of the people.

Judge Allison of the Chancery Court on April 3 held the new telephone law to be constitutional, and refused to grant the in-

Digitized by Google

junction restraining the Secretary of State from granting a charter to the Home company under the provisions of the new law. To complete the bitter disappointment to the Cumberland interests, who had applied for the injunction, the charter was granted an hour after the court's decision.

*A RURAL LINE RINGING CODE CRITICISM.**

———, Iowa, March 25, 1907.

Editor, AMERICAN TELEPHONE JOURNAL,
New York, N. Y.

My Dear Sir:

I to-day am in receipt of the lost copy of March 23, and can well account for the delay. Such a system of ringing codes as suggested on page 190 could easily stop transmission in the mails. In lieu of the writer thereof putting 42 telephones on a twenty-mile line, I would suggest that a line be built from the East to the wild West and all farmhouses along the route put on it. It would not need to be a metallic line, as a line of No. 16 iron with so few (?) on would be large enough.

The advantage of this line would be that the people in the East could use it before break of day in the West, and when we were using it they would be in their little beds. I had no idea that so simple a question would excite so much valuable material, and almost hesitate to send in several more that I have in mind. Experience of 15 years in the telephone business in a state that has more rural telephones than any State in the Union has taught me that 15 telephones on a rural line is just about 3 or 4 too many.

What we want is something practical, short and not complicated. Many of the suggestions so far lack in this particular. The benefit I can get from this question is the information which leads me to think that many of these rural lines are entirely too heavy. I cannot understand why they load them down so, and cannot see how they can give good service. Service on a rural line with us must be as near perfect as possible, and perfection can never be expected on a party line under the present system with 75 telephones on a single wire. How would my friend from Pennsylvania get 1-3 of a ring and 5 second space with a power ringer? We don't want to put stop watches on all our telephones until we have tried the system.

Yours truly, *S. E. C.*

INDIANA TAX COMMISSIONERS GIVE HEARING TO TELEPHONE COMPANIES.

DURING the week beginning April 28th, telephone companies will be given a hearing before the State Board of Tax Commissioners of Indiana, at Indianapolis. Formerly the session of the Commissioners during which telephone interests were considered was held much later in the season, so it is important that telephone companies should be aware of the change of date, in order that if they have any matters to bring before the board they may not be subjected to undue assessments through lack of knowledge of the hearing.

MAINE INDEPENDENT TELEPHONE ASSOCIATION PERMANENTLY ORGANIZED.

BY A. M. FOGG.

AN enthusiastic meeting of members and representatives of Independent Telephone companies from all over the State of Maine was held at the Dewitt House, Lewiston, Wednesday, March 20th, 1007. Although informal meetings have been held before, this one was called expressly for the purpose of organizing an Independent association, and it was unanimously decided to perfect a permanent organization. After a brief discussion of "Preamble," "Declaration of Purposes," "Constitution and By-laws," etc., a form was adopted for these statements.

The following officers were elected for a term of one year: President, F. E. Ebersole, Portland; vice-president, W. H. Lurvey, West Paris; secretary, M. E. Crow, Houlton; treasurer, Harry S. Russ, Mount Vernon; executive committee, Dr. Beihaut, Calais; F. L. Ames, Norridgewock; C. P. Chandler, New Gloucester; F. E. Ebersole, M. E. Crow. The president of the Maine Association, Mr. Ebersole, is a man with wide experience in Independent affairs, and will undoubtedly do much to make the new organization a strong one during the coming year. He feels confident that there will be a rapid advance in the movement.

At this meeting there were nearly 8,500 Independent telephones represented, and all sections of the State sent delegates. Among those present at the meeting were Harry S. Russ, general manager, Mt. Vernon Telephone Co., Mt. Vernon; Elmer E. Daicey, manager, Lewiston-Auburn Telephone Co., Lewiston; D. R. Smith, manager, Bethel Telephone Co., Bethel; W. H. Parsons, manager, Livermore Falls Exchange of Northeastern Telephone Co.; W. H. Lurvey, manager, Paris Hill & West Paris Telephone Co.; A. M. Fogg, Hebron Home Telephone Co., East Hebron; E. A. Ebersole, Northeastern Telephone Co., Portland; B. N. Lewis, Northeastern Telephone Co., Lisbon Falls; H. B. Hartford, manager, Standish Telephone Co., Standish; C. P. Hubbard, manager, Lovell Telephone Co., Lovell; F. E. Ebersole, vice-president and general manager, Northeastern Telephone Co., Portland; G. R. Armstrong, manager, Farmington Exchange, Northeastern Telephone Co.; M. E. Crow, manager, Aroostook Independent Telephone Co., Houlton. Among representatives of manufacturers were Ivan Goodrich, Chicago Telephone Supply Co., Chicago, Ill.; A. D. Richmond, C. S. Knowles & Co., Boston; J. S. Wells, Union Hardware & Electrical Co., Providence, R. I.

Letters of regret were read from a number who were unable to be present.

METHODS OF CREOSOTE ANALYSIS.

IN its Trade Bulletin No. 13 the United States Forest Service announces that the growing scarcity of lumber, with the consequent high prices, is making it imperative that more attention be paid to preservative processes whereby the time of service of timber may be lengthened. Coal tar creosote is generally regarded as the most efficient of the wood preservatives. This product is very variable in composition, owing to differences in the coals used and in the methods employed in their distillation. Creosotes of different compositions are believed to have different values as wood preservatives, and an analysis of the oil used is, therefore, important.

No very large amount of study has been directed to perfecting the methods of creosote analysis, and the Forest Service, believing the matter vitally important to the progress of wood preservation, is now carrying on an investigation of these methods.

The most important part of a creosote analysis is the fractional distillation, since by this operation an approximate determination is made of the relative proportions of the most important substances in tar oil. There has been considerable divergence of opinion as to the best way of carrying out the fractionation of tar oils, some recommending a retort as a distilling vessel and certain temperatures for taking fractions, others recommending a distilling flask and a different set of temperatures.

Laboratory experiments carried on by the service have shown that the differences in the weights of the fractions

*EDITOR'S NOTE.—Where there are as many different ways of accomplishing a result as are being brought out in this rural line discussion it is inevitable that there should be many differences of opinion. This is a long story, and we have decided that the best way to handle it is to leave it practically in our subscribers' hands and let them sort the wheat from the chaff. There will be good points for every one, both in the line of what to do and what to avoid.

Digitized by Google

obtained when using different sorts of distilling vessels are not large, but that the composition of the fractions indicate a little better separation by the flask than by the retort. As regards the influence of the rate of distillation, variations of from one to three drops per second have but slight influence on the weights of the fractions, although the slower rate is more satisfactory.

It is commonly believed that the relative amounts of light oil, naphthalene and anthracene oil are the most important factors determining the value of the creosote for wood preservation. A number of creosotes were very carefully fractioned and determinations made of the amounts of naphthalene and solid anthracene oil distilling between various temperatures. The average of the results shows that at least twenty-five per cent. of naphthalene was present in the distillate between 205° and 250° C., and that over twenty-five per cent. of anthracene oil solids are present in the distillate above 300° C. Work on the specific gravity and the index of refraction of the distillates between different temperatures is now being carried on, and the results will be made public after the completion of experiments.

The desirability of getting the criticisms and suggestions of users of creosote has led to the publication of a detailed account of the methods employed in the experiments and the results which have been obtained. Those who desire the publication should ask for Circular 80, Fractional Distillation of Coal Tar Creosote. The request should be made to the Forester, Forest Service, Washington, D. C.

Telephone Legislation in 1907*

MISSOURI.

HOUSE BILL No. 546, introduced by Mr. Emerson, Jan. 22, 1907, is an act the object of which is to compel public utility companies, including telephone companies, which operate under franchises to charge no more for their service than the rates fixed by the cities, towns, or villages in which they operate.

HOUSE BILL No. 666, introduced by Mr. Groff, Jan. 29, 1907, is similar in purport in so far as it affects telephone companies to House Bill No. 546, although it differs in its provisions affecting electric power companies.

HOUSE BILL No. 302, introduced by Mr. Brooks, Jan. 16, 1907, is a rate limiting act, providing a maximum rate of $5.00 per month for business service, and $1.00 per month for residence service in cities of 10,000 people or more; for all telephones outside the limits of cities with more than 10,000 population, maximum rates are fixed at $2.00 per month for business and $1.00 per month for residence service; long distance rates are subject to a provision calling for a maximum day rate of one-quarter cent per mile and one-half of this rate for night messages.

HOUSE BILL No. 393, introduced by Mr. Brooks, is intended to empower county courts or the municipal authorities of any city, town or village to regulate the rates for telephone service, which is included with other public utilities. It is provided that in order to ascertain what rates are just and reasonable the county courts or municipal authorities shall hear testimony from all interested parties at a public hearing after notification in prescribed form.

HOUSE BILL No. 60, introduced by Mr. Noyes, Jan. 4, 1907, is a physical connection bill, providing that where two or more telephone companies maintain an exchange in the same city or town, it shall be their duty to establish a means of exchanging messages between their principal offices. A novel provision in this bill is that a subscriber to one of the telephone companies who may wish to secure connections from the lines of the other may deposit the sum of $5.00, out of which his tolls shall be taken at the rate of 3 cents for a three minute local conversation until the deposit is exhausted. Other clauses of the Act relate to the penalties for disobedience.

SENATE BILL No. 108, introduced by Senator Dowell, Jan. 14, 1907; the object of this bill is to prevent the charging of unequal prices for the same kind of service in different cities of the same class by the same company. The penalty proposed is a fine not to exceed $1,000 and the revocation of the company's charter to do business in the State.

HOUSE BILL No. 178, introduced by Mr. Barry, Jan. 8, 1907, is an act to repeal section 1,255, article 6, chapter 12, Revised Statutes of Missouri, 1899, and to enact a new section in lieu thereof, relating to the duties of telegraph and telephone companies in connection with the handling of messages.

SENATE BILL No. 313, introduced by Senator Humphrey, Feb. 1, 1907, provides that it shall be unlawful for any corporation or person to string a wire over the tracks of a railroad company, except at such places and in such manner as shall be approved by the railway commission, with due notice to the railroad company. The railway commission has full power to regulate the height and manner of the running of such wires. The height in no case from the top of the track to the wire to be less than 22 feet.

MINNESOTA.

SENATE BILL No. 456, introduced by Senator Witherstine, Feb. 28, 1907, is a bill to provide for the imposition and collection of a proportionate earnings tax upon the gross earnings of all telephone property within the State. It provides that telephone companies shall return to the State Auditor before the 28th of February, in each year, a true statement of the gross earnings during the preceding calendar year, verified by the president and secretary or two of the other principal officers. This statement shall be made out to show the amount of gross earnings from toll lines and from each exchange. Three per cent. of the gross earnings is to be paid into the State treasury in lieu of all other taxes and assessments upon all property of the company within the State including capital stock and franchise. The remainder of the act relates to the distribution of the amounts so collected and the method of handling the information obtained under the act, and also the penalties for disobedience.

HOUSE BILL No. 340 provides that every telephone company shall pay into the State treasury on January 1st, 4 per cent. of its gross earnings derived from business within the State, which shall be in lieu of all general taxes on personal or real estate and upon the capital stock.

NEBRASKA.

HOUSE BILL No. 448, introduced by Representative Cone, Feb. 26, 1907, provides that it shall be unlawful for any person or corporation operating a railroad to permit a telegraph or telephone operator employed in relation to train service to be on duty for more than 12 hours in any 24 consecutive hours.

SENATE BILL No. 100, introduced by Senator Epperson, Jan. 14, 1907, is the well-known Nebraska physical connection act, the object of which is to make all companies operating telephone lines or exchanges common carriers, subject to the regulations, so far as applicable, which regulate the transportation of property by railroad companies, and to put the telephone companies under control of the State Railway Commission. Rebates and other devices for unjust discrimination are prohibited and physical connections between systems operating in the same localities is made compulsory. The Railway Commission is given power to regulate such joint service as may be given when such connection has been made, as well as to regulate rates and the distribution of receipts after granting a hearing to interested parties. The act provides that an appeal may be taken by any company from the ruling of the commission to the district court of the county, the burden of the proof being in all cases upon the appellant. Telephone companies are required by another clause to make annually a full statement of the value of all their property and franchises, with a statement of indebtedness and receipts and expenditures for the past year for the information of the Railway Commission. This statement is required to include the number of instruments owned and employed by the company and number of miles of line owned or operated, also the number and character of the exchanges, with their location. The State Railway Commission is given power to regulate the methods of keeping accounts of telephone companies. Telephone companies are required by clause 24 of the bill to post in conspicuous places in their public offices, toll stations and public booths, schedules of all rates and tolls charged.

SENATE BILL No. 312, introduced by Senator Wilsey; referred to Committee on Judiciary. This act provides that all telephone wires which pass over the line of any steam railroad shall be supported on good, substantial poles not less than 12" diameter at the bottom and 6" diameter at the top, set in the ground not less than one-sixth of their length, and well tamped. Double cross-arms shall be used, and all wires insulated with glass or porcelain insulators, securely fastened to both cross-arms. The cross-arms should be set in gains not less than 1" deep and fastened with two bolts. All wires must clear the top of the rail by at least 27 feet.

SENATE BILL No. 378, introduced by Mr. W. R. Patrick, read first time February 26, 1907; read second time February 27, 1907, and referred to Committee on Miscellaneous Corporations, provides that no railroad company shall require or permit a telephone operator employed in connection with the train service to be on duty more than twelve hours in any twenty-four consecutive hours.

HOUSE BILL No. 103, introduced by Mr. Jenison, read first time January 16, 1907; read second time January 17, 1907, and referred to Committee on Telegraph and Telephones and Electric Companies, has for its object to make telephone companies common carriers, subject to such laws, so far as applicable, as now apply to transportation of property by railroad companies, and places telephone companies under the control of the Railway Commission. The passage of the act would give to the Railway Commission power to regulate rates, and the interchange of service which is provided for in the bill by a physical connection clause. It has a clause which prohibits rebates, and provides that the division of charges arising from joint service of two connecting companies may be regulated by the Railway Commission.

(To be continued.)

QUERIES

RESISTANCE OF COPPER WIRE.—(841.)

The writer has heard there is a simple method of determining the resistance of various sizes of wire without the necessitiy of consulting a wiring table. If you know of anything of this nature you will confer a favor by advising me. S. M.

The method of which you have heard is undoubtedly that which is frequently used in connection with copper wire of the B. & S. gauge, and is approximately covered in one sentence, *i. e.:* A wire which is three sizes larger than another wire has half the resistance, twice the weight and twice the area, and a wire that is ten times larger than another wire has one-tenth the resistance, ten times the weight and ten times the area.

Thus if you will take as a basis No. 10 copper wire, remembering that it is 0.10 inch in diameter, it has an area of 10,000 circular mils, it has a resistance of 1 ohm per thousand feet, and weighs 32 pounds per thousand feet, you will be able to determine readily the resistance, size and weight of wire of any other size. Copper wire is approximately 1 1-7 times the weight of iron wire the same size.

Another way of stating the same thing is that the ratio of resistances corresponding to each higher number is as follows: 1:1¼, 1:1½, 1:2. Thus No. 11 wire has a resistance of 1¼ ohms per thousand feet; No. 12, 1½ ohms per thousand feet; No. 13, 2 ohms per thousand feet. Then use the same ratios with the resistance of No. 13 wire as a base for computing numbers up to 16, etc.

TELEGRAPH REPEATER CONNECTIONS.—(842.)

In your issue of Nov. 10, 1906, you show a telegraph repeater circuit. I would like to ask if all of these circuits could not be worked from one battery or generator; also if you wanted to connect one more station in on this line how you would do it. M. V. W.

By following the circuits shown with the article on November 10th you can probably see very easily how the instruments operate. If you do this you will see that the object of the repeater is to pick up feeble currents on one line, and send out

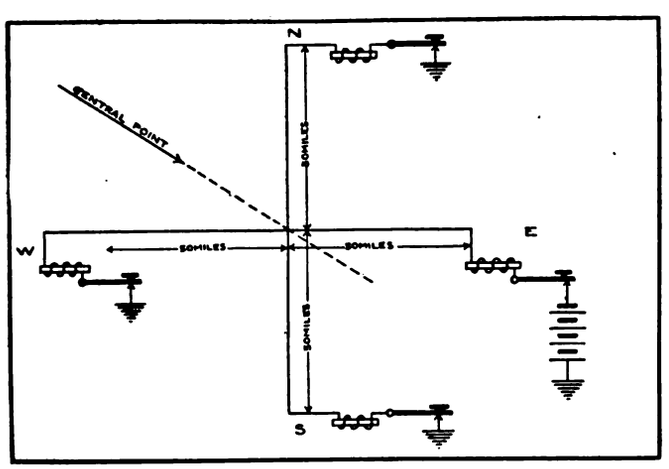

Fig. 842a.

corresponding currents over the other line, which shall be capable of making stronger signals than those received at the repeater. For instance, if you wished to transmit signals over a five hundred mile circuit, it might appear to you that you could obtain the necessary power for doing this by using a high voltage battery or machine at one end. You would find, however, that the current would diminish so rapidly near the end of the line, owing to leakage, which would be much greater with high voltage than with a low electromotive force, that you would not get good results.

The use of a repeater is an alternative which is much more satisfactory. An automatic repeater, in fact, takes the place of an operator, as without it you would find it necessary to have an operator receiving on one line and sending out on the other, owing to the impossibility, as we have explained, of using extremely high voltage batteries.

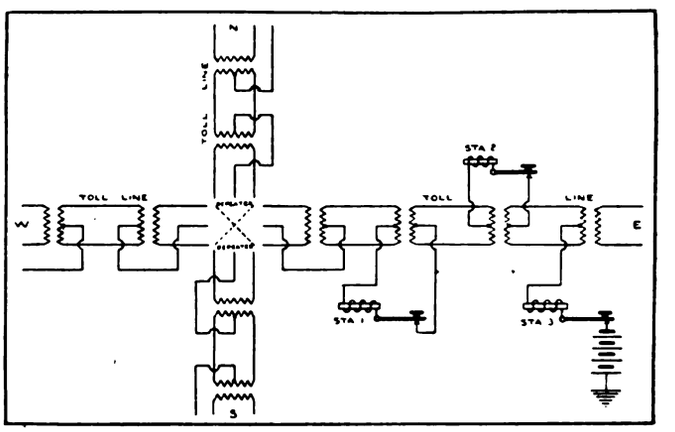

Fig. 842b.

A modern telegraph repeater will repeat a message in either direction, and even has the advantage over an operator that its working is instantaneous, the signal being retransmitted practically at the instant of its reception, thus giving the effect of a through line as far as practical working is concerned.

By an examination of Fig. 842*a* you will readily see that in connection with a four way circuit, such as was described in the article referred to, the use of a single battery would be wholly impracticable. For instance, if you should open the key at *east* with a single battery, the armatures at *north, south* and *west* would all fall back; close the key at *east* and they will all come up again, the signal thus being transmitted from *east* to all of the other stations. It would, however, be impossible for *north, south* and *west* to break each other, as the line would be grounded. The use of a repeater with separate batteries makes it possible for them to signal each other.

As to your second question: Fig. 842*b* shows how to connect several stations into a line, the connection being made on the ordinary simplex circuit plan. Fig. 842*c* shows a single wire

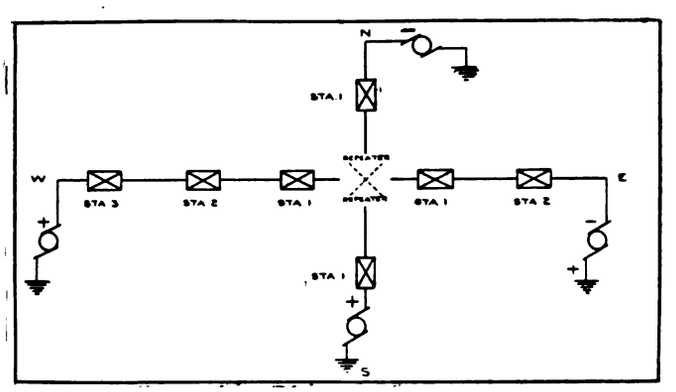

Fig. 842c.

telegraph line, with several stations connected into it; and, you will see that if you consider that in the simplexed part of the telephone line both sides of the telephone line form practically a single conductor for telegraph current, conditions in the two last figures may be made similar.

THE EDITOR'S PAGE

BUILDING UP THE SOUTH.

NASHVILLE has at last been opened up to the Independents. Probably the longest and most bitterly and persistently fought campaign which has ever been carried on by an Independent company reached its culmination in the court decision which affirms the validity of the new Tennessee law, and the granting within an hour of a State charter for an Independent telephone system in the principal city of Tennessee and the home of the Cumberland branch of the Bell company.

Readers of AMERICAN TELEPHONE JOURNAL have for more than a year past been kept informed, as rapidly as they took place, of the important steps in the proceedings which have led up to this all-important result. A brief review of these matters appears in an article upon another page, which terminates with the report, received by telegraph at the time this paper goes to press, of the final success of the Independent interests.

The results of this decision will be far-reaching. It gives to the Independents far more than the right to operate in one of the most important cities in the South. Already a number of the largest cities in the Cumberland territory contain well developed Independent systems which are receiving the hearty support of citizens. Smaller cities, too, are served by Independent lines, and rural systems have been built in hundreds of places. Still, this section of the country is very far from being developed with the thoroughness that characterizes the work of the Independent systems in the surrounding States. Local influences have been too strong, and there has been a lack of confidence in the future support of governing bodies which has been a decided hindrance. Now the hold of the monopoly upon its own State is broken. Legislature, governor, and the courts have decided against it, and these are all supported by a strong and aroused public opinion. The Independents have arrived, and have come to stay.

Conditions are ripe for the building of hundreds of small plants, and many of these will be constructed within a comparatively few months. Toll service of the highest grade will be assured to them by the well-built lines which are being pushed through from Kentucky to the gulf, reaching all important centers of population and business.

The dissatisfaction with the Bell service which is reported in numerous localities—and is so deep-seated as to have called forth organized protests from hundreds of citizens in Mississippi, Tennessee and other States—will assure to the new lines a good business from the start.

Last year brought into reach of the Independent companies many important cities. Still, in spite of the greater size of some of the cities which expressed their approval of telephone competition, it is doubtful if any Independent victory was more significant than this opening up of Nashville, for this has been brought about through the pressure exerted by the people of an entire State, aided by their neighbors in a large and important section of the country.

SPRING TREE TRIMMING.

HOW many companies plan the trimming out of their lines and carry on the actual work in as thorough and systematic a manner as characterizes other branches of maintenance work? The importance of doing this is shown not only by the number of service complaints that are traced to interference of branches and foliage of trees with lines, but by the very large number of controversies and legal questions which relate to this matter of trimming. It is something that requires no haphazard action, but definite planning, under competent and careful supervision

We recall once having made a trip through a certain town with a special agent of a telephone company and the local tree warden. This was in the autumn, and the tree warden was very conscientious and careful about the interests of his town, until by chance the route led by a cider mill. After this had been passed the telephone man found things easier, and when the linemen went along the route they found that they could cut for years to come. Now, this may have been all right for the moment, but it is not very hard to see where it may have been probably bad for the future.

Everyone who was interested in shade trees had something to say about the telephone company, and private rights of way have probably been granted only after prolonged protest ever since. That is one disadvantage of trimming in the fall of the year. It does too much damage to the trees. So the spring is far better. It is at this season that the work can be done with the least risk of permanent injury to the trees. Also, the absence of foliage makes it possible for the men doing the work to see, much better than is possible later in the season, what branches are likely to be a source of trouble. It should be borne in mind that there is a chance of trouble from limbs at the side of the line which may be swayed by the wind, as well as from those growing directly into the wires. It is well to have a rather definite idea of the rate of growth of different kinds of trees, for by looking ahead a year or two it is often possible to make cuttings which in the end save considerable to the telephone company, without permanently injuring the tree.

When a company sends out a trimming gang the viewpoint of the general public has to be borne in mind just as much as when solicitors are sent out for contracts. The average town dweller likes to see the trees along the streets look well. That is the main thing they were planted for. When cutting must be done, he demands that it shall be done cleanly. When he sees where a lineman has hacked away at the middle of a limb, cutting from the top and letting a long sliver peel off on the lower side, he gets angry. He knows who is to blame, and his anger is likely to be pointed, as well as strong. The wise telephone manager looks after his trimming carefully, for it is good business to keep the good opinion of the people in his town on all matters he sets before them.

LIGHTNING AND THE NEWSPAPER MEN.

THE way some telephone men will talk to a reporter is astonishing. The latest evidence that someone has taken a young newspaper man and spoken with him in a fatherly fashion until he was well "filled" comes from a city where lightning went on a rampage and ate up a telephone cable or two. This wasn't enough for the man who had to make a story. Something brilliant, startling, anything to make the story fit the occasion had to be worked up. He was probably looking for information that would help him out on this kind of a story, and he surely got it. "Large blue balls of fire danced along the wires, cracking like the reports of revolvers." How is that for a good one?

Still, in spite of the amusement this gives a telephone man, it's pretty poor stuff to circulate among subscribers and those who are prospective telephone users. There are too many timid ones who are likely to persuade themselves that putting in a telephone is just like hurrying ahead the day of judgment.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

JOINT LIABILITY FOR SAGGING WIRES.

As one of your subscribers, I take the liberty of submitting to you the following statement of facts and asking your opinion as to the liability of the telephone company.

This company had its line of wires on one side of a street, erected by permission on the poles of a trolley company. On the other side, on the poles of the Bell Telephone Company, were electric wires. The tel phone company had occasion to string its wires directly across the street and then through vacant lots to reach a subscriber, and strung these wires so that they were between the electric light company's wires and those of the Bell Telephone Company, but some distance from both. During a very severe sleet storm the telephone wire came in contact with the electric light wire, though apparently the contact was a swinging one and not fixed. The insulation on neither wire was burned through, though several of the fuses were burned out on that particular telephone line. One of the subscribers on this particular line owned a market which was burned, although the fire was not discovered for three hours or more after the cross occurred. The owner of the market had no insurance on his property and looks to the telephone company for reimbursement.

To recapitulate, when the cross occurred the insulation was not burned off the wires, though the fuses were blown out of the arresters in four or five cases. The arrester was of an approved form and properly installed. There are no guard wires between the electric light wires and those of the telephone company. The wires of the telphone company, during a very severe sleet storm, sagged and made a cross. Would the telephone company, in view of all these facts, be so negligent as to be, in your opinion, liable for all the loss incurred? Or would the liability be joint? Or would the liability be that of the electric company solely?

I would appreciate such suggestions as you would care to make.

L. H. W.

UNLESS the sleet storm was one of such severity as not to be expected in the latitude where the accident happened, it would make no difference with the question of liability. It seems to us that the electric light company is liable for the injury because it was its duty to erect guard wires to prevent the escape of electricity from its wires to other wires. This duty rests upon the electric company on account of the powerful current of electricity it uses. Guard wires have been declared to be the most effectual remedy for preventing contact with other wires. State vs. Janesville Street Railway Co., 87 Wis., 72; 41 A. S. R., 23; 4 Am. Elec. Cas., 289. Where both companies knew the situation was dangerous it has been held that it is the duty of both to erect guard wires, and that both are jointly liable for failure to do so. McKay vs. Southern Bell Telephone Co., 111 Ala., 337; 31 L. R. A., 589; 19 S., 695. Central Penn. Tel. Co. vs. Wilkes-Barre & W. S. R. Co., 11 Penn. Co. Ct., 417.

"TRUST BUSTING" SUITS IN INDIANA.

FIVE suits have been filed at Shelbyville, Ind., against the Mutual Telephone Company and the Central Union (Bell) Telephone Company. They are "trust busting" suits and allege that the sale of the Mutual Company to the Central Union Company was merely a pretended sale and that it is a conspiracy to restrain competition. The plaintiffs in all these cases make the same allegations. They maintain that they had contracts with the Mutual Company to furnish them telephone service and that one of the provisions of the contract was that none of them should be placed on "party lines."

The plaintiffs allege that after the "pretended" sale of the Mutual Company to the Bell company the agents of the last named company entered their houses and stated that they were going to put in new telephone instruments and wire the house for party line telephones. The plaintiffs now ask the court to declare the transfer from the Mutual Company to the Bell company null and void and that the property be transferred back to the Mutual Company and the business placed in the same hands it was before the pretended sale.

LAND OWNER'S SILENCE DOES NOT BAR HIS SUIT TO REMOVE POLES FROM HIGHWAY.

THE American Telephone and Telegraph Company constructed its lines on the highway without obtaining the consent of the land-owner upon whose fee in the highway the lands encroached and without condemning such right of way. He delayed some time before bringing suit, but not beyond the statute of limitations provided in such cases. Then he sued for a mandatory injunction to compel the telephone company to remove its lines. There was no pretense that the company had not a right to appropriate the complainant's property to its own use without compensation. The sole claim made in support of its position was that the land-owner stood by and permitted the company to construct the line and in no sense interfered with it. The court found that the company was in no different position than any other person entering upon another's land, knowing he had no right, and did not change its position in any way in reliance upon the land-owner's silence. The company showed that a large number of long-distance telephone messages were sent over the line delayed, and that it would be convenient for the public to have the company occupy the complainant's land. This fact the court held to be of no importance whatever, as the law provided a way of taking land for public use by condemnation proceedings. It was therefore held that a mandatory injunction should issue as asked for by the complainant. Burrell vs. Telegraph Co., 79 N. E., 705.

INJURY TO SUBSCRIBER ON TAKING HOLD OF THE TRANSMITTER.

A JUDGMENT for a remarkably large verdict, amounting to over ten thousand dollars, was affirmed by the Supreme Court of Pennsylvania, in the case brought against the United Telephone and Telegraph Company, of Chester, Pa. Thomas Delahunt was a subscriber who had been having trouble with his telephone instrument. This had been out of order and unfit for use for some time. One evening a sound resembling the noise made by a cricket came from the direction of the telephone, and Mr. Delahunt said, "I believe that is the telephone. I wonder if it is in use." He then got up and walked over to it and took hold of the transmitter with both hands, drawing it down. As he did so, there was a flash of flame all around the telephone and he was almost instantly killed by the electric shock. His two children brought suit against the company and recovered. The plaintiff did not prove the particulars of the company's alleged negligence, the trial court applying the doctrine that the injury presumed negligence, and this, the Supreme Court held, was a proper decision and the doctrine *res ipsa loquitur* properly applied.

The defense of the company was that the deceased was guilty of contributory negligence in taking hold of the instrument after he heard the noise, and when he knew the line had been out of order. The court held, however, that the deceased did only what anyone would have done under the circumstances and was not negligent. He was standing on a wet carpet, but this, the court decided made no difference with the case. Delahunt vs. United Telephone and Telegraph Co., 64 A., 515.

IN THE OPERATING FIELD

A FEATURE OF CABLE DISTRIBUTION IN MEXICO.

By "Noleye."

THE illustration on this page is made from a photograph of one of the house-leads of the Ericssons' underground system in Mexico City.

On the corner, near the trolley pole, and dominating the two streets, is the pit where the main cables are run. The 100-pair cable necessary for distribution in this block runs from the pit in a single cement duct under the sidewalk to the side of the house, goes up through a cast-iron elbow to a certain height, where a sheet-iron pipe (galvanized) joins the iron elbow, and runs through this up to the top of the roof. In convenient corners formed by the parapet, which runs all around the flat roof, the various 20, 10 and 5 pair distributing boxes, made of cast iron, are placed, and thence the small distributing cables are carried out to the different subscribers.

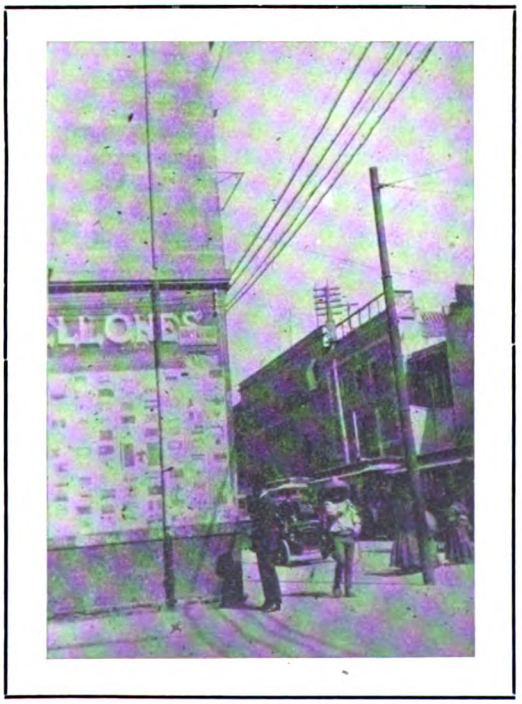
The leading-up pipe is painted the same color as the house, and in no way disfigures the building. not even when placed on the flat wall of a house, as is the case in the illustration. In most cases the division line between two buildings is selected, and in such a case a 100-pair cable lead can hardly be noticed.

There are about thirty blocks supplied in this manner already, and the work of connecting up subscribers in these is progressing rapidly.

POWERFUL ORGANIZATION WILL BUILD INDEPENDENT SYSTEM OF LONG-DISTANCE LINES IN MICHIGAN.

LONG-distance lines which will provide for all the needs of Independent telephone exchanges in Michigan, giving connections between the individual Michigan companies as well as an outlet to the rest of the country, are to be built by the Inter-State Long Distance Telephone Company. The capitalization authorized by the charter is $15,000,000, of which two-thirds will be preferred stock, the par value of all shares being set at $100.

The names of the incorporators are: William B. Woodbury, Hugo A. Koehler, C. Marquard Forster, Max Koehler, Thomas H. Wagner, Charles H. Hood, Sam B. Jeffries, George E. Lawson, Henry C. Potter, Jr., John M. Dwyer, William T. Barbour, Henry Koehler, Jr., William W. Grayson, J. J. Goodyear and Fred T. Moran. These gentlemen will not only be directors in the Inter-State Long Distance Company, but they will also form a part of the directorate of the Home Telephone Company of Detroit, and will constitute the executive committee, which will control both companies. A voting trust has been formed to prevent members from disposing of the holdings of stock to competing interests. R. B. McPherson, of Howell, Mich., president of the Livingston Home Company of that city, is also one of the directors of the new company, being represented on the local governing board by William W. Grayson. E. A. Faust, vice-president of the Anheuser-Busch Brewing Company, is represented by Charles H. Hood.



Cable Carried up Wall of Building in Iron Pipe—A Typical Distribution Feature in the City of Mexico.

It is said that $1,500,000 is to be expended for construction during 1907, and work on sixty telephone circuits, including more than 3,000 circuit miles of wire, will be pushed with a large force of men until the entire system is completed. The plans cover the construction of new pole lines from Detroit to Toledo, Adrian, Jackson, Lansing and Holly, where connection can be secured with the leading Independent lines of the country and an unbroken system established. The Toledo line will establish an adequate connection with eastern points; the Adrian line will accommodate southwestern Michigan; the Jackson line will serve the central portion of the State and furnish a direct line to Chicago; the Lansing branch will connect with the Independent telephone systems in the Grand Rapids district, and the Holly line affords a means of reaching Flint, Saginaw, Bay City and the entire Saginaw Valley.

BELL FRANCHISE REPEALED BY CITY COUNCIL AT MT. VERNON, IND.

THE City Council at Mt. Vernon, Ind., has repealed the franchise of the Cumberland Telephone and Telegraph Company, granted in February, 1899, for a period of fifteen years, and the city now asserts that the company is operating without authority. Before a new franchise is granted, the city demands more favorable conditions to subscribers, cheaper toll rates, free telephones and a short-term franchise. The Cumberland Company responds that it is operating under an old and perpetual franchise, bought from the American Telephone and Telegraph Company. This franchise was granted by the City Council in 1899, but it was never operated under by any company, and it was repealed in December, 1906, on the ground that it was illegal because of its perpetual features. If the company persists in operating under the old American franchise it is said that the city attorney will institute mandatory proceedings looking to the removal of the Cumberland poles and wires from the streets. This proceeding will bring into question the legality of the franchise granted to the American company.

PROGRESS ON THE MUNICIPAL TELEPHONE SYSTEM AT EDMONTON, ALBERTA.

WORK is progressing very rapidly on the telephone system now being installed by the City Council of Edmonton, Alberta, and it is expected that the new system will be in operation by the first of next August. Since work was first started there has been a decided rise in the price of materials, and it is expected that the $60,000 set aside for the installation of the system will not be sufficient on this account. It is also expected that the 1,200 telephones arranged for will not be sufficient to meet the requirements by the time the plant is ready for operation. At present there are 580 telephones in operation and applications for 140 more connections. The charges to be made are as follows: Business, desk instruments, $33.00 per year; wall instruments, $30.00 per year; residences, desk $23.00, wall $20.00; party lines, two instruments only, $50.00; rural system, toll

Digitized by Google

charges, minimum, $20.00, the same rates charged in the past.

At these rates the system during 1905 paid a net profit of $4,149.98, and there will be no reduction in rates until the running expenses are ascertained, after which the rates will be put on the lowest possible working basis. Strathcona is also to install a system soon, the Edmonton Council having been granted a twenty-year franchise to extend the lines across the river.

MISSOURI DISTRICT ORGANIZATION MEETS AT HANNIBAL.

TELEPHONE companies from Monroe City, New London, Laddonia, Vandalia, Center, Hannibal and Quincy were represented at the meeting recently held at Hannibal. The Independent telephone men who compose this organization are taking up many matters which will tend to improve conditions in the section in which they operate. The association was not organized until last January, but it is expected that it will make it possible for companies to carry on many improvements which will benefit subscribers to the Independent service, and improve conditions under which the associated companies operate. A. P. Matson, of New London, is president of the association. Among those present at the recent meeting were the following: Robert Merriweather, Monroe City; J. D. McCune, Vandalia; J. H. Davidson, Hannibal; F. A. Parker, Quincy; A. P. Matson, New London, and J. R. Braden, Laddonia.

RURAL LINE COMPANIES PROTEST AGAINST SWITCHING FEES.

TELEPHONE interests at Scottsville, Ky., have been worked up to fever heat recently by the fifty-two rural Independent lines entering that place refusing to pay the increased charges assessed against them by the Allen County Home Telephone Company, which owns and operates the exchange in Scotts- Telephone Company of Macon County, Tenn., have each agreed ville, to which the rural lines are connected. Heretofore the town company has been charging the rural lines each $10 per year for connections. Recently the rate was changed to $3 per telephone on the rural lines. Many of the country lines have as many as ten instruments on the line, which would make them pay as high as $30 per year for service. The Cumberland and the Home Telephone Company of Macon County, Tenn., have each agreed to put in a switchboard at Scottsville and take the business of the rural lines, but no agreement has been arrived at. Fifty-four Independent lines and the Cumberland (Bell) line are interested in the muddle, which will hardly be settled for some time.

DO YOU SHUT YOUR DOORS TO BUSINESS?

You're not so foolish, you say.

But wait:

Is your telephone busy very often in the day?—valuable patrons dissatisfied?

Is your private exchange crowded with so much business that the central operator must give the busy signal to anyone?

Do you know that it is exactly the same to a patron who calls you up and finds you busy, as if he had called at your office and found it shut up and locked?

Do you know that your wires are capable of just a certain amount of business, which may have been plenty for you three months ago, but may not be nearly enough *now?*

Watch that telephone door for business.

You do more important business over it every day than any single one salesman—perhaps all of them—could do.

Ask for the Subscriber's Agent to make an analysis of your needs. He's hired to serve you free. His service may mean great benefit to you.

HOME TELEPHONE COMPANY.

Just call up Main 294, and talk it over.

Advertisement Used by a Telephone Company.

TELEPHONE COMPANY TAKEN TO TASK FOR ADVERTISING LIQUOR IN DIRECTORY.

CITIZENS of Paris, Ky., recently held a meeting and roundly denounced the policy of the Cumberland Telephone & Telegraph Company, which was carrying a liquor advertisement on the front cover of the local directory. In a letter to Dr. I. A. McSwain, who was elected secretary at the meeting where resolutions censuring the company were passed, Leland Hume, the Cumberland general manager, says:

"It is necessary for us, in the economical prosecution of the business, to make an effort to have each department pay its way,

Reproduction of a Portion of the Cover of the Paris, Tenn., Directory of the Cumberland Tel. & Tel. Co.

as far as possible, and bear its own burden, but we will seek, as far as the Paris Directory is concerned, other kind of advertisement, and will not knowingly or willingly do anything that would cause you to feel or act unfriendly or unkindly toward us."

On the inside of the cover appear the names of the executive officers of the company, separated from the liquor advertisement only by the thickness of the paper. Many people think it very strange that these men, in view of the character of many of their public utterances, should permit such an advertisement to appear in the directory under any circumstances. Telephone men are saying with some amusement that undoubtedly the company needs the money, but that is all the more reason why stockholders should see that it is managed by some one who knows when water is hot before he puts his foot in it.

PROPOSED BILL TO COMPEL CONNECTIONS BETWEEN COMPANIES IN MICHIGAN.

A BILL to make telephone companies common carriers and place them under the general supervision of the railroad commissioner is to be introduced into the Michigan Legislature, now in session. The bill provides that any company may be required to perform switching service for another company upon such terms and conditions as may be laid down by the railroad commissioner. It also gives any telephone company the right to intersect with or cross any other line, and compels such companies to connect their lines at convenient points in order to perform joint service. Absolute authority is given the railroad commissioner to fix and prescribe all necessary rates between points on the same line and also for joint service. The bill is fathered by Representative Duncan, of Wayne county.

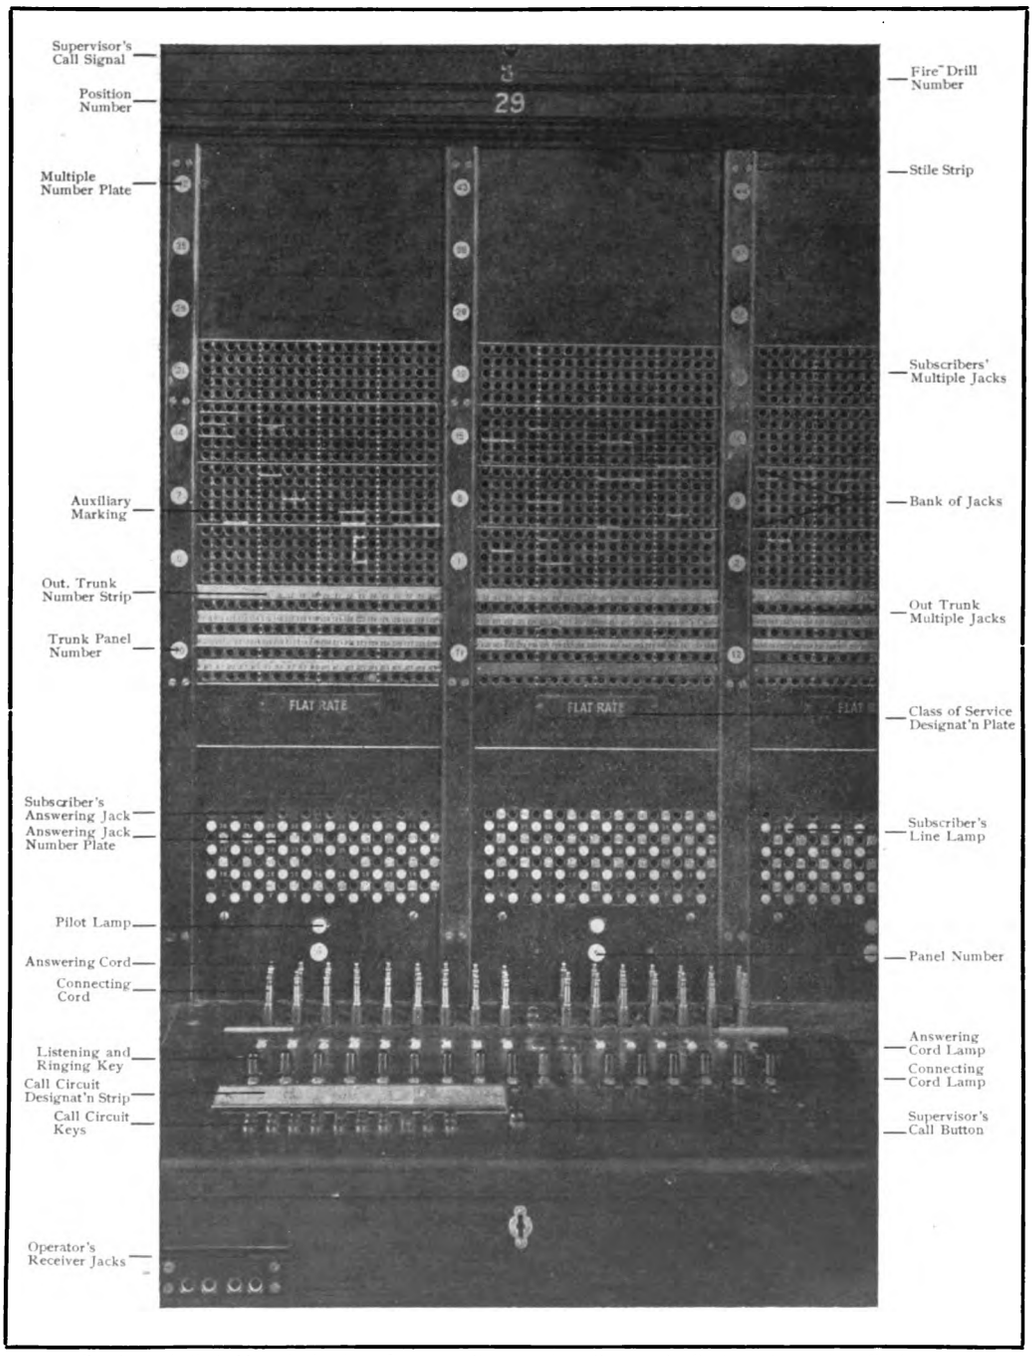
The Public and the Telephone Switchboard

VISITORS to the Chicago Electrical Show, and more especially those who were not familiar with the working of a telephone exchange, found many things to interest them in the branch exchange which gave service to the various exhibitors at the big exposition in the Auditorium.

This branch exchange was installed by the Chicago Telephone Company, and consisted of standard large size switchboard sections. So many people who watched the operators at work were anxious to find out just what each piece of apparatus was called and what purpose it served in the switchboard that the company had attendants stationed in its booth for the purpose of making replies to all inquiries. More was done than this, however, for pains were taken to provide the visitors to the branch exchange with materials which would enable them after reaching home to recall to mind what they had learned while looking at the actual working exchange. A card was prepared for distribution which bore a half-tone reproduction of portion of a section of a multiple switchboard, containing full equipment for a regular subscriber's position. The various separate pieces of apparatus were indicated by lines extending to their names printed in the margin. A reproduction of a portion of this card which shows these features appears upon this page.

The usefulness of this plan of publicity goes beyond the mere gratification of the curiosity of people who may or may not be subscribers to telephone service. The public is given to realize that a telephone switchboard is really a very complicated affair in itself, must be costly to build, and requires care and skill on the part of those who install and operate it as well as those who keep its delicate apparatus in the most efficient working condition. The information given out under this interesting plan should be helpful in maintaining a proper attitude between the public and a telephone company. It ought to have a strong tendency to reduce the number of complaints concerning trifling errors in the service, and also have the effect of diminishing the number of protests against the rates charged by the telephone company.



Portion of Switchboard Section Corresponding to One Operator's Position in a City Exchange.

FUNERAL SERVICE HELD BY TELEPHONE.

IN Auburn, Me., a few days ago, it is reported that a child was taken ill with diphtheria and died. The fact that a little girl in the house was ill with the same disease prevented the removal of quarantine, and the parents of the child found it impossible to ask a minister to come to the house. In this emergency the telephone was called into use, and by its aid the Rev. A. J. Marsh, pastor of the Baptist church at Auburn, led the services. In this way the telephone was the means of bringing consolation to the parents of the child.

Not only were services held, and the comforting words of the minister heard by the parents, but a number of friends joined the family in listening to them. This was made possible by the making of suitable connections at the central office, as well as by the use of other instruments on the same party line. This is the first time that a telephone has been used for such a purpose in the State of Maine, and is believed by many to be the first recorded incident of this sort which has occurred anywhere in the entire country.

The matter has been given wide publicity in the newspapers of the State, and elsewhere, and this publicity promises to be useful in extending benefits of telephone service to others who may be so unfortunate as to find themselves unable to hold religious services in the regular way during a similar emergency.

TELEPHONE PATENTS

TELEPHONE ATTACHMENT.

William R. Whitehorne, Bethlehem, Pa., patents (No. 844,839; dated February 19th, 1907; filed September 19th, 1906; serial No. 335,288) and assigns to Howard C. Bailey, Philadelphia, Pa., a telephone attachment.

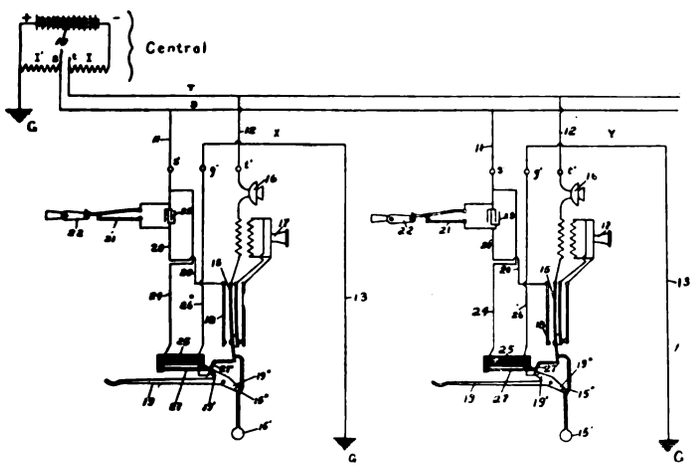
The object of this invention is to provide a means for one subscriber to signal another with whom he is connected through the central office, and who has his telephone off the hook but is not listening, without attracting the attention of the operator, or to enable an operator to signal an instrument when the receiver is off the hook. A repeating coil is provided with an auxiliary winding on the same core with the two windings included in the line. An armature is associated with the core, and is adapted to actuate a mechanism, which after the armature has been attracted and released a certain number of times will cause switch contacts to be closed. Under normal conditions, with both sides of the connection in use, the current through the separate windings of the repeating coil neutralize the core, but this condition of neutrality is periodically destroyed when one subscriber alternately opens and closes his line. When the switch is closed it allows alternating current to pass through the third winding of the repeating coil. This produces by induction in the line windings a high frequency alternating current, which being transmitted to the line causes the receiver at the desired station to operate with a characteristic hum.

PARTY-LINE LOCK-OUT SYSTEM.

Mark P. Boone, Peru, Indiana, patents (No. 845,328; dated February 26, 1907; filed January 27, 1906; serial No. 298,272) and assigns to The Peru Common Battery Lock-Out Telephone Co., Peru, Indiana, a common battery party-line lock-out system.

This patent is a modification of No. 798,561 issued August 29, 1905, to Mr. Boone, and claims to incorporate features whereby a person may readily communicate with another person on the same line, and experience no disagreeable noises during the period of establishment of the desired connection.

The inventor states that in practice he finds that when ringing



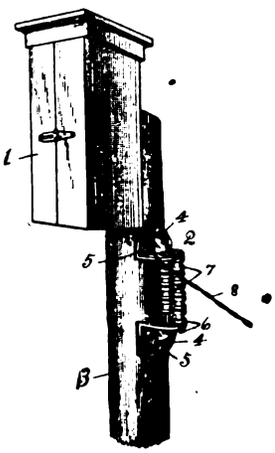
selectively on the line the alternating ringing currents are likely to cause a chattering of the relay, therefore he provides means whereby the receiver hook controls the movements of the relay armature 27.

A condenser is provided, bridged across the terminals of a push button 21 on the subscriber's instrument. This combination is used in the event of the calling subscriber desiring to communicate with another party on the same line.

By pressing the button 22 and opening the switch 21 the circuit of the current energizing the lock-out relays is opened and the called for subscriber may then remove his receiver from the hook. The alternating currents emanating from the called subscriber's instrument will pass through the condenser 23 readily and the calling subscriber thus being aware that the person desired is on the line, releases push button 22. This allows current to again flow through the lock-out relays in the other instruments, preventing other persons from entering into the talking circuit.

POLE DISTRIBUTION RACK FOR TELEPHONE SYSTEMS.

William Robinson, Muskegon, Michigan, patents (No. 846,144; dated March 5, 1907; filed May 3, 1906; serial No. 314,947) and



assigns to The W. G. Nagel Electric Co., Toledo, Ohio, a pole distribution rack.

This patent covers a form of wire distribution from cable terminals, and consists of an iron frame with suitable insulators mounted thereon to which may be attached the distributing wires leading away from the cable.

The claims on this bracket are, a form of support so adjustable as to accommodate any number of wires; a method whereby wires leading away from the cable in the same direction may be readily accommodated.

The adjustment is accomplished by moving the L-shaped brackets 4 to greater or lesser distances apart, and inserting bolts 6 of suitable length, upon which are placed the insulating spools 7.

SELECTIVE RINGING AND LISTENING KEY.

Jules A. Birsfeld, Rochester, New York, patents (No. 848,283; dated March 26, 1907; filed February 13, 1905; serial No. 245,524) and assigns to The Stromberg-Carlson Telephone Manufacturing Co., Rochester, New York, a switching device.

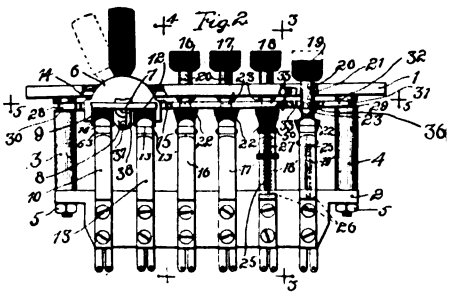
This patent is intended to cover an improvement over the switching device described in the application of Alexander M. Haubrich, filed September 28, 1904; serial No. 226,286. It relates to a combination four-party selective and operator's listening key, in which the movement of any of the four buttons restores to normal position any other button of the operator's listening key, or the movement of the operator's listening key restores to normal position any of the four ringing buttons.

Digitized by Google

PATENTS—Continued.

The release of the various buttons is by means of a sliding plate being actuated by the cam detent of the button or key operated.

The sliding plate 31 having a pressure exerted against it at all times by the steel spring 33 immediately slides over the shoulder of the cam detents 23, when a button is pressed down the entire



distance, thus locking it. Then when the cam detent on another button exerts pressure against the plate it causes the plate to move sufficiently to release the key previously locked.

The inventor also claims a key wherein the noise resultant of the quick return of the various buttons to normal condition is obviated by the use of separator plates between the contact springs, which cause the springs to retain, at all times, their proper adjustment, and consequently exert no retarding force on the plunger, thus allowing the use of a lighter helical spring for the purpose of restoring the buttons to normal position.

NOISE EXCLUDING ATTACHMENT FOR RECEIVERS.

James R. Challen, Collegeville, Pa., patents (No. 844,299; dated Feb. 12, 1907; filed May 12, 1906; serial No. 316,481) an attachment for telephone receivers.

This patent covers an auxiliary earpiece of soft rubber or other flexible material which is inserted in the opening of the receiver cap and is so shaped as to fit into the outer ear when the receiver is used in the customary manner. This, the inventor claims, entirely excludes from the ear any noises foreign to those set up in the receiver.

COIN COLLECTOR.

Frank R. McBerty, Evanston, and Howard B. Holmes, Park Ridge, Ill., patent (No. 846,500; dated March 12, 1907; filed December 7, 1904; serial No. 235,858) and assign to The Western Electric Company, Chicago, a coin collector.

This patent covers a form of coin collector or pay station in which the coin deposited operates a caliper lever by means of which the signaling mechanism is adjusted in such a manner as to allow of a distinctive signal being given by striking a gong several blows, the number of which depends on the class of coin deposited.

ATTACHMENT FOR TRANSMITTER MOUTHPIECES.

William Charles Plank, Las Flores, Mexico, patents (No. 843,362; dated February 5th, 1907; filed August 1st, 1906; serial No. 328,732) an attachment for transmitter mouthpieces.

This invention consists of an attachment consisting of a number of leaves of antiseptic paper padded to conform to the inside of a transmitter mouthpiece. Each sheet is provided with three extensions, which may be bent over the mouthpiece and engaged by a split metal ring, which fits over the front edges of both paper and mouthpiece, holding them securely together by its pressure. Each sheet has a line of perforations, in order to make it easy to tear it out and leave a clean sheet exposed.

PORTABLE TELEPHONE SET.

George F. Atwood, East Orange, N. J., patents (No. 842,377, dated January 29th, 1907; filed February 26th, 1906; serial No. 303,018) and assigns to the Western Electric Company, Chicago, Ill., a portable telephone set.

This patent covers a portable box divided into two partitions, the upper of which contains a tray for the reception of the telephone instrument, which may consist of a transmitter and receiver mounted upon the same handle. In the lower compartment are to be mounted an induction coil, condenser, ringer and bell, with auxiliary apparatus to facilitate their proper use. The box has cut in one face an opening provided with a flap to protect it from the weather. This opening is provided to make it easy to hear the sound of the ringer.

LOCK FOR MANHOLE COVERS.

Benjamin T. Letts, Elizabeth, New Jersey, patents (No. 845,182; dated February 26, 1907; filed May 31, 1906; serial No. 319,486) a lock for manhole covers.

The inventor describes a lock for manhole covers in which four arms are caused to operate radially from the center, entering below the outer casing of the manhole and retaining the cover in position securely.

The lock is so designed as to require the use of a special key to operate the releasing mechanism of the radially operated arms or clutches before the cover of the manhole may be moved.

CEMENT POLE.

Anderson G. Crow, Murphysboro, Ill., patents, (No. 839,272; dated Dec. 25, 1906; filed Sept. 24, 1906; serial No. 336,033) a cement telephone pole.

This patent covers a pole-section of cement or composition enclosing a metallic reinforcing core provided with means for coupling at its opposite ends. Being a sectional structure any desired height may be readily obtained. The cross-arms are made of tubes suitably arranged and coupled to the upper end of the top section.

ANTISEPTIC MOUTHPIECE GUARD.

Gerhardt E. Grimm, Camden, New Jersey, patents (No. 843,940; dated Feb. 12, 1907; filed August 12, 1905; serial No. 273,879) an antiseptic guard for telephone transmitters.

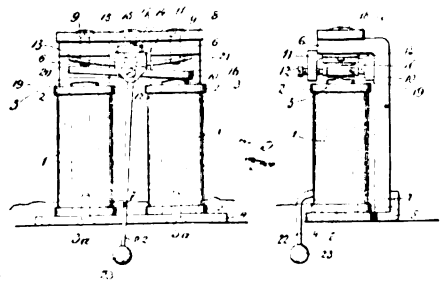
This invention provides an attachment for transmitter mouthpieces containing a roll of some form of tissue, saturated with a disinfectant solution, so arranged that it may be held taut in front of the mouthpiece. The attachment is secured to the mouthpiece by means of clamps which slide over the edge of the transmitter mouthpiece.

TELEPHONE RINGER MOVEMENT.

Klas Weman, Buffalo, New York, patents (No. 846,368; dated March 5, 1907; filed January 23, 1906; serial No. 319,080) a telephone signaling device.

The invention covers a telephone ringer movement of the polarized type. The objects aimed at are ease of assembling and adjustment of the armature by means of a single screw.

The armature 10 is mounted on a curved spring 13, which is



adjusted by means of screw 18, thereby altering the relative distance of the armature from the electro magnets.

There is also incorporated a thin sheet spring 19 between the armature and the pole pieces for the prevention of sticking of the armature, due to residual magnetism in the electro magnet cores. This spring is permanently attached to the center of the armature.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

THE NEW ANDRAE HOOK-SWITCH.

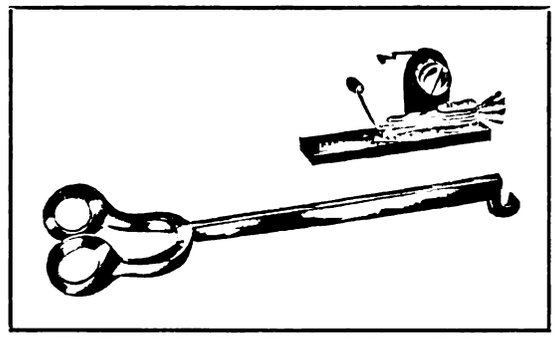
A NEW hook-switch has been designed by the Julius Andrae & Sons Company, 99 West Water street, Milwaukee, Wis., and is now being used in its telephones. This switch is of the long, detachable lever type, and has several very practical features.

The compensating spring is entirely independent of the contacts. It is given one turn around the bearing screw and one end anchored in the frame, while the other is bent to engage the hook-lever. The main contact spring is fitted with an insulating roller which engages the lever, thus obviating the friction.

The contact springs are insulated from the frame; contact points are of platinum. The entire construction conforms thoroughly with the high standard set by the Andrae Company for all its equipment.

AMERICAN ELECTRIC FUSE COMPANY GETS DETROIT CONTRACTS.

AMERICAN ELECTRIC FUSE COMPANY, Muskegon, Michigan, and New York, N. Y., has received from the Dean Electric Company the contract for all the switchboard protector apparatus used in the main and branch exchanges of the new Home Telephone Company, Detroit, Mich. The standard American type "H" protector was specified, it having been found to meet all the exacting tests and to answer all the specifications of Dean Electric Company's engineers. The order is for approximately 20,000 pairs of American type "H" protectors, and is claimed to be the largest switchboard protector order ever placed.



The New Andrae Hook Lever and Contact Springs.

American Electric Fuse Company also received direct from the Home Telephone Co., Detroit, Mich., the order for all the cable terminal equipment at Detroit, the American type "J" terminal being specified. The American Electric Fuse Company thus receives the largest contract let this year for cable terminal equipment and the largest order for telephone switchboard protector apparatus, the total contracts for Detroit amounting to more than twenty-five thousand dollars.

FIRE AT ROME, N. Y., HAS NOT AFFECTED ABILITY OF WIRE AND TELEPHONE COMPANY OF AMERICA TO MAKE DELIVERIES.

IT is reported by the Wire and Telephone Company of America, at Rome, N. Y., that since the fire which destroyed a portion of its plant on February 23, 1907, reports have been circulated that this will hinder the company in taking care of the requirements of its trade. The company is particularly anxious to have the trade know that the fire will in no way hamper the delivery of its various products. The fire destroyed only that part of the plant in which bare copper wire was drawn, and immediate arrangements were made by the company for the drawing of its copper by other mills.

The company was just about to erect a large addition to its plant, which, in connection with the rebuilding of the wire mill, is now well under way. When these buildings are completed it will have a thoroughly modern wire manufacturing plant in connection with another new and modern building to take care of its telephone business. The new buildings now in course of erection will be of brick and steel construction, absolutely fireproof. The entire manufacturing plant will be equipped with a sprinkler system, which, in connection with a pumping station belonging to the company and water tanks of sufficient capacity, will make its fire protection independent. The entire manufacturing plant, including present works, will be operated by electric power, equipment being so arranged that machinery can be driven independently in groups. The handling of copper throughout their works will be done by pneumatic hoists, and all machinery and equipment will be such as experience has demonstrated to be best adapted for the production of high-class work in connection with economy.

THE GRAY TELEPHONE PAY STATION COMPANY, Hartford, Conn., in its new catalogue, describes its full line of pay stations for use with all kinds of telephone instruments and in all sorts of locations. The illustrations show not only the exterior of the apparatus, but also the construction of the mechanism which is employed to insure positive signals and protection against fraud.

A device which is widely used in some places, and is giving good satisfaction, is the Gray No. 3 Register, which is attached to the telephone in such a way as to transmit a bell signal over the line when a call is recorded, and at the same time cause the register to be advanced one number on a dial which is visible to the subscriber. Full information concerning this apparatus and a copy of the catalogue may be obtained upon application to the company.

STROMBERG-CARLSON TELEPHONE MFG. COMPANY, Rochester, N. Y., is sending out a number of leaflets describing various types of cords for telephone switchboards, desk telephones and receivers. These folders are illustrated in such a manner as to clearly show the construction of the cord, form of tips, etc. They may be obtained, together with prices on any desired class of goods, on application to the company. The company is making a practice of sending out especially complete information on cords, showing in detail how, and of what materials they are constructed.

HELIOS MANUFACTURING COMPANY, Bridesburg, Philadelphia, Pa., is marketing a new form of protector for which the positive claim is made that it protects telephones absolutely against lightning. It is made with or without sneak current arresting coils. Particulars will be sent those interested.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., announces the closing of a contract for 10,000 additional lines of automatic telephone equipment for the Home Telephone & Telegraph Company of Los Angeles, California. This is for immediate installation in the new Olive Street Exchange, and the completion of this exchange will practically mean the elimination of the manual equipment now in use in the present main exchange.

Other contracts placed with the Automatic Electric Company during the first two months of 1907 are: Home Tel. & Teleg. Co., Portland, Ore., 3,000 additional; Montana Ind. Telephone Co., Butte, Mont., 2,000 lines; Home Tel. & Teleg. Co., Tacoma, Wash., 1,000 additional; Rushville Co-Operative Tel. Co., Rushville, Ind., 800 lines; and several smaller additions to present automatic exchanges.

THE WEEK'S MESSAGES

NEW COMPANIES.

LAKE BUTLER, FLA.—An Independent telephone company is being organized at Lake Butler, and $1,200 of stock has already been subscribed. Col. Knight is one of the organizers, and it is the company's intention to establish an exchange at this city, and build lines to the neighboring towns.

SANDWICH, ILL.—The Farmers Telephone Company, Sandwich, has been incorporated with a capital stock of $5,000. The incorporators are J. S. Knights, F. J. Steezer and O. H. Anfinsen.

SULLIVAN, ILL.—Articles of incorporation have been filed by the Sullivan Mutual Telephone & Telegraph Company. It has an authorized capital stock of $17,500, and the incorporators are C. E. Harsh, J. C. White and W. I. Sickafuss.

WESLEY, IA.—Articles of incorporation have been filed by the Blake & Nelson Rural Telephone Company.

GLADWIN, MICH.—The Gladwin County Telephone Company has been organized with a capital stock of $15,000.

MANKATO, MINN.—An Independent telephone company, to be known as the Le Sueur Valley Telephone Company, has been organized to construct a line from Mankato into Decoria. The following officers have been elected: President, A. Burlison; vice-president, Frank Pohl; secretary, Geo. Rivers; treasurer, Martin Bowe.

PAYNESVILLE, MINN.—The Zion Rural Telephone Company has been organized at Paynesville for the purpose of building lines out of this city into the farming community in the towns of Zion and Lake Henry. About thirty-four miles of line will be erected, and the following officers have been named: President, F. C. Nehring; vice-president, J. A. Roach; secretary, Wm. Arndt; treasurer, W. A. Manz.

BROOKHAVEN, MISS.—The Tpoisaw Telephone Company, with a capital stock of $2,000, has filed articles of incorporation.

SALEM, MO.—An Independent telephone company, to be known as the Barren Forks Telephone Company, has been organized to construct a line from Salem to Timber, a distance of about thirty miles.

ANDES, N. Y.—The Andes and Bovine Telephone Company, of Andes, has filed articles of incorporation. It has an authorized capital stock of $480, and the incorporators are George Little, J. L. Strangeway, William J. Hyzer, of Andes, N. Y., and others.

POPLAR RIDGE, N. Y.—The Cayuga Southern Telephone Company has been incorporated with a capital stock of $50,000, and will operate Independent telephone lines and exchanges at Poplar Ridge, Aurora, Union Springs, Fleming, Venice, King Ferry, Scipio, Cayuga and other villages in Cayuga county. Rural lines will also be built to Genoa, Venice, Ledyard, Springport and other places. The directors of the new company are R. B. Fegan, Samuel Jeffrey, L. H. Williams and G. W. Jeffrey, of Ithaca, and I. P. Hazard, Isaac Hazard, Jr., and Chas. M. Hazard, of Poplar Springs.

MILNOR, N. D.—The Milnor Rural Telephone Company has been incorporated with a capital stock of $10,000. Among the incorporators are Arnold Christensen, Edgar Christensen and M. Christensen, all of Milnor, N. D.

FIAT, O.—The Fiat Telephone Company has filed articles of incorporation. The capital stock is placed at $500, and the incorporators are Peter Hahn, Cyrus McQueen, W. D. Lint, A. L. Eckert, John Eckert, Philip Hahn, J. D. Thomas and Jacob Stein.

GALENA, OKLA.—Articles of incorporation have been filed by the Wild Cat Telephone Company of Galena. It has a capital stock of $2,500, and among the incorporators are John G. Corbin, M. S. English and F. Strong.

LAWTON, OKLA.—Articles of incorporation have been filed by the Sulphur Springs Rural Telephone Company, of Lawton. It has a capital stock of $1,000, and the following directors have been named: H. O. Miller, L. T. Dawes, F. H. Beady, J. E. Trevar, S. L. Fargunar, of Lawton.

CONDE, S. D.—An Independent telephone company, to be known at the Conde Telephone Company, with headquarters at Conde, has been organized by A. Lewis, B. R. Cowan, E. H. Smith and H. P. Hildebrand. Its authorized capital stock is $50,000.

HAYES, S. D.—The Homestead Telephone Company, of Hayes, has been incorporated with the intention of connecting with the Bad River lines. The incorporators are A. R. Beal, W. A. Hopkins and J. D. Rainey.

WESTMORELAND, TENN.—The Sumner County Home Telephone Company, with a capital stock of $10,000, has been organized. This company succeeds the Westmoreland Telephone Company. The new company will have connections with several other Independent companies. The incorporators are C. W. Caldwell, W. L. Wilder, P. C. Anglea, S. W. Brown, F. L. Link and Bascom Simmons.

PULLMAN, WASH.—The Breeze-Burgan Telephone Company, of Pullman, has been incorporated with a capital stock of $3,000. The incorporators are S. H. Breeze, E. R. Young and others.

CORNUCOPIA, WIS.—An Independent telephone company has been formed at Cornucopia, and connections are to be made with Washburn.

CHARLOTTETOWN, P. E. I., CAN.—An Independent telephone company is being organized by the business men of Charlottetown and Halifax, to establish connections by laying a cable under the Straits of Northumberland.

FRANCHISES.

SULPHUR, I. T.—A franchise to construct a telephone system at Sulphur has been granted to E. J. Hines, of Tulsa.

KINSLEY, KAS.—A franchise has been granted at this city to the Kansas Telephone & Telegraph Co.

MARSHALL, MO.—An application for permission to build and maintain a telephone exchange at Marshall has been applied for by E. M. Ingleheart, of Miami.

PASCO, WASH.—A franchise has been granted to A. J. Newton to construct and operate a telephone system at Pasco.

FINANCIAL.

MASCOUTAH, ILL.—The capital stock of the Looking-glass Prairie Telephone Company has been increased from $10,000 to $20,000.

RUTLAND, ILL.—The Central Illinois Independent Telephone Company has increased its capital stock from $30,000 to $75,000.

WINDOM, KAS.—The Windom Telephone Company has increased its capital stock to $5,000, and expects to extend its line to Inman.

LOUISVILLE, KY.—A quarterly dividend of 1 per cent. on its capital stock has been declared by the Louisville Home Telephone Company.

MAYFIELD, KY.—The Lilly Telephone Company has increased its capital stock from $6,000 to $12,000.

WILLIAMSBURG, KY.—The stock of the Williamsburg Home Telephone Company has been increased from $5,000 to $10,000.

HIGHLAND, N. Y.—The Highland Telephone Company has voted to increase its capital stock from $40,000 to $75,000.

FOOTVILLE, WIS.—The Footville Telephone Company has increased its capital stock from $10,000 to $15,000.

FREISTADT, WIS.—The Freistadt and Cedarburg Telephone Company has filed articles of amendment increasing its capital stock from $500 to $3,000.

COMBINATIONS.

DAYTON, O.—The stockholders of the Home Telephone Company are considering a proposition to take over the property and franchises of the Montgomery County Telephone Company.

OLD FORT, O.—The Home Telephone Company, of Gibsonburg, has sold its plant at Old Fort to the Old Fort Mutual Company, the consideration being $3,200.

ELECTIONS.

POMONA, CAL.—The following officers have been elected by the Pomona Valley Telephone & Telegraph Company; F. W. Thomas, president; J. A. Dole, vice president; C. E. Walker, treasurer; A. M. Dole, secretary.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

CYCLOPEDIA OF APPLIED ELECTRICITY

5 large volumes each nearly one foot high—2500 pages

Bound in red morocco, fully indexed. Contains 2,000 full page plates. Diagrams, Desciptions, Formulæ, Sections, Tables—supplemented by practical test questions—prepared especially for practical men who have no knowledge of advanced mathematics by such noted authorities as F. B. Crocker of Columbia University and the Crocker-Wheeler Company, Prof. Esty, Head of the Department of Electricity, Lehigh University, and others.

FOR THE TELEPHONE MAN

This Cyclopedia thoroughly explains all the duties of the manager, lineman, switchboard and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms—undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

Contents

Telephone Instruments, Telephone Lines, Telephone Exchange, Telephone Operation, Automatic Telephone, Wireless Telephony, Magnetism, Measurements, Wiring, Telegraphy, Direct Current Dynamos and Motors, Electric Lighting, Railway Power and Lighting, Arc Lamp Development, Electrical Construction, Management of Dynamos and Motors, Power Station, Alternating Current Machinery, Power Transmission.

REGULAR PRICE, $30.00. **SPECIAL PRICE, $19.80.**

Sent express prepaid for 5 days' FREE examination.

If the books meet your needs, pay $2.00 cash and $2.00 a month thereafter, until you have paid $19.80, the special price. Return, at our expense, if you do not care to keep the books.

We make this greatly reduced price for 30 days to interest the public in the superior character of the instruction of the American School of Correspondence—these books being compiled from the relative instruction papers of the school. A 200-page handbook fully describing 60 courses in Engineering sent FREE on request if you mention American Telephone Journal.

THE WEEK'S MESSAGES

BONDVILLE, ILL.—The following officers have been elected by the Bondville Telephone Company: President, W. H. Scott; vice-president, O. T. Bell; treasurer, P. M. Jacobs; secretary, O. W. Norton; manager, G. L. Siefkin.

PONTIAC, ILL.—At Pontiac the following officers were elected by the Indian Grove Farmers Central Telephone Company: President, W. Henderson; vice-president, Elmer Crouch; secretary, M. N. Jones; treasurer, Ben Cumpston.

PETERSBURG, IND.—The Pike County Telephone Company has named the following officers: President, J. W. Coleman; secretary, W. D. Goad; treasurer, G. J. Nichols; manager, C. H. Webb.

HANLONTOWN, IA.—At a recent meeting of the board of directors of the Hanlontown Co-operative Telephone Co., K. O. Burtness was chosen as president, and N. W. Phillips as secretary.

LOVELL, ME.—The following directors have been elected by the Independent Telephone Company of Lovell: C. P. Hubbard, W. C. Bassett, O. E. Andrews, J. A. Jones and A. R. Shirley.

WINTHROP, MINN.—The Peoples Independent Telephone Company has elected the following officers: Henry Witte, president; C. M. Peterson, vice president; C. A. Benson, treasurer; J. A. Larson, secretary and manager.

MIDDLETOWN, N. Y.—The Middletown Telephone Company has elected Dr. M. C. Conner, president; Dr. Edwin Fancher, vice-president; Geo. B. Potter, treasurer; W. C. Ramsdell, secretary.

ANTWERP, OHIO.—The following officers have been elected by the Antwerp Telephone Company: President, P. P. Doering; vice president, C. A. Lindemuth; secretary and treasurer, J. H. Finley.

HURON, O.—The following trustees have been named by the stockholders of the Erie County Mutual Telephone Company; T. M. Clock, N. E. Woessner, A. P. Herman and Harry Cook, of Huron; Messrs. Ritz, Hein and Lander, of Shinrock.

SHERWOOD, O.—The Mutual Telephone Company has elected Henry Huston, president; secretary, Chas. Coffin; treasurer, Geo. Kellermeier.

MISCELLANEOUS.

WOLF LAKE, IND.—Connections are to be effected by the Whitley County Telephone Company, of Etna, with the Noble County Telephone Company, at Wolf Lake.

TONGANOXIE, KAS.—The Tonganoxie Telephone Exchange has been purchased by F. B. McKinnon, of Lawrence, who will make many improvements in the plant.

PERSONAL.

ROY OWENS has recently been promoted to the position of superintendent of the Columbus Citizens' Telephone Company, Columbus, O. About five years ago Mr. Owens started on assembling and testing work for the Automatic Electric Company, of Chicago, and afterward worked as installer and inspector on most of the company's large installations and cut-overs up to the time he became connected with the Citizens' Company. He has been with this organization for about a year and a half, and is known as one of the most enthusiastic and capable automatic men in the country.

D. G. RALEY has been appointed general manager of the northern division of the Columbiana County Telephone Company, which includes exchanges at Salem, Sebring, Leetonia, Lisbon, East Palestine, Columbiana and New Waterford, Ohio.

DAVID EIDLEBACH has been appointed manager of the exchange of the Southwestern Telephone and Telegraph Company at Flatonia, Texas.

New Construction in the Field

SANTA ROSA, CAL.—The Rural Telephone Company expects to build lines to Melitta and other points.

MONROE, GA.—New lines are being constructed by the Bold Spring and Monroe Telephone Company.

BYRON, ILL.—Among the improvements planned by the Byron Telephone Company is the installation of a new switchboard.

CANTON, ILL.—The lines of the Canton, Sugarville & Fairview Telephone Company are being rebuilt.

GRANTFORK, ILL.—The Grantfork Rural Telephone Company expects to build fifteen miles of new line.

MACOMB, ILL.—The Farmers' and Merchants' Telephone Company is about to commence the construction of its system at Macomb.

EAST ENTERPRISE, IND.—It is the intention of the Farmers Mutual Telephone Company to install a new switchboard.

ELKHART, IND.—Many improvements are to be made in the plant of the Home Telephone Company.

JAY, IND.—The Farmers Telephone Company is at work on the construction of its system.

SHEFFIELD, IA.—The Mutual Telephone Company contemplates making many improvements and extensions in its system.

LOUISVILLE, KY.—Many improvements are to be made in the plant of the Home Telephone Company at Louisville.

MT. VERNON, ME.—Preparations are being made by the Mt. Vernon Telephone Company for the extension and improvement of its system.

DEXTER, MICH.—The Washtenaw Home Telephone Company is building lines in and about Dexter.

OXFORD, MICH.—Many improvements and alterations in its system are contemplated by the Oakland County Telephone Company.

HIBBING, MINN.—The Hibbing Telephone Company, which has recently installed a new switchboard, expects to build additional lines.

NORTHFIELD, MINN.—New lines are to be erected by the Northfield Telephone Company in this city and vicinity.

ST. JAMES, MINN.—About thirty-five miles of new lines are to be erected by the St. James Telephone Co.

BLAIR, NEB.—The Blair Mutual Telephone Company expects to greatly improve and enlarge its plant.

OMAHA, NEB.—Actual work on the plant of the Independent Telephone Company will be commenced at once.

OVERTON, NEB.—Many improvements are to be made by the Independent Telephone Company in its plant at Overton.

ELY, NEV.—It is the intention of the White Pine Telephone Company to spend about $50,000 in extending its lines.

FARGO, N. D.—The long distance service of the North Dakota Independent Telephone Company is being extended. A local system has been installed at Cleveland, and toll connections are to be established with Bowdon and Sterling.

CELINA, O.—A line to Celina, O., has been erected by the Eastern Indiana Telephone Company, where connections are to be made with the United States Telephone Co.

LORAINE, O.—The Mississippi Valley Telephone Company, of Carthage, has established a new exchange at Loraine.

KUTZTOWN, PA.—A line to Topton is one of the improvements planned by the Consolidated Telephone Company.

MEADVILLE, PA.—A private telephone system for the Erie Railroad Company is to be installed.

NAZARETH, PA.—Among the improvements recently made by the Slate Belt Telephone Company was the installation of a new switchboard.

CANOVA, S. D.—The Nansen Telephone Company is making preparations to construct about seventy-five miles of new rural telephone lines. These lines will be in Clearwater, Henden, Adams, Grafton and Belleview townships.

LYNNVILLE, TENN.—Considerable construction work is being done by the Home Telephone Company at Lynnville.

SALT LAKE CITY, UTAH.—The Eastern Utah Telephone Company is preparing to install a local system at Castledale, which will connect with Salt Lake City and all of the Carbon county mining camps.

ANACORTES, WASH.—The Farmers' Mutual Telephone Company, of Everett, is planning many improvements at Anacortes.

PUYALLUP, WASH.—The plant of the Puyallup Telephone Company is being thoroughly overhauled.

CAMBRIDGE, WIS.—The lines of the Kegonsa Telephone Company are being extended to Stoughton.

MARQUETTE, WIS.—The installation of a new switchboard and other improvements are planned by the Marquette Telephone Company.

SULLIVAN, WIS.—The Sullivan Telephone Company is extending its lines to Maple Grove.

WELCOME, WIS.—The Matteson Telephone Company expects to build new lines to Symco and Leeman. A new exchange is also to be established at Welcome.

WOSTOK, ALB., CAN.—The Lamont Telephone Company, whose line extends to Star, is building a line to Wostok, and also expects to build lines to Andrew, Hunka, Pakan, Whitford and Skarp.

MONTREAL, QUE., CAN.—The Dominion government expects to build a telephone system along the banks of the St. Lawrence River, to be used in connection with navigation. The estimated cost is $18,000. Address Hon. Brodeur, Minister of Marine and Fisheries, Ottawa, Ont.

YORKTON, SASK., CAN.—The ratepayers have decided in favor of the town controlling the system of the Yorkton Northwestern Telephone Company. A number of extensions are planned, including lines to Canora, Saltcoats, Cressient and other towns in the district. Address W. D. Dunlop, mayor.

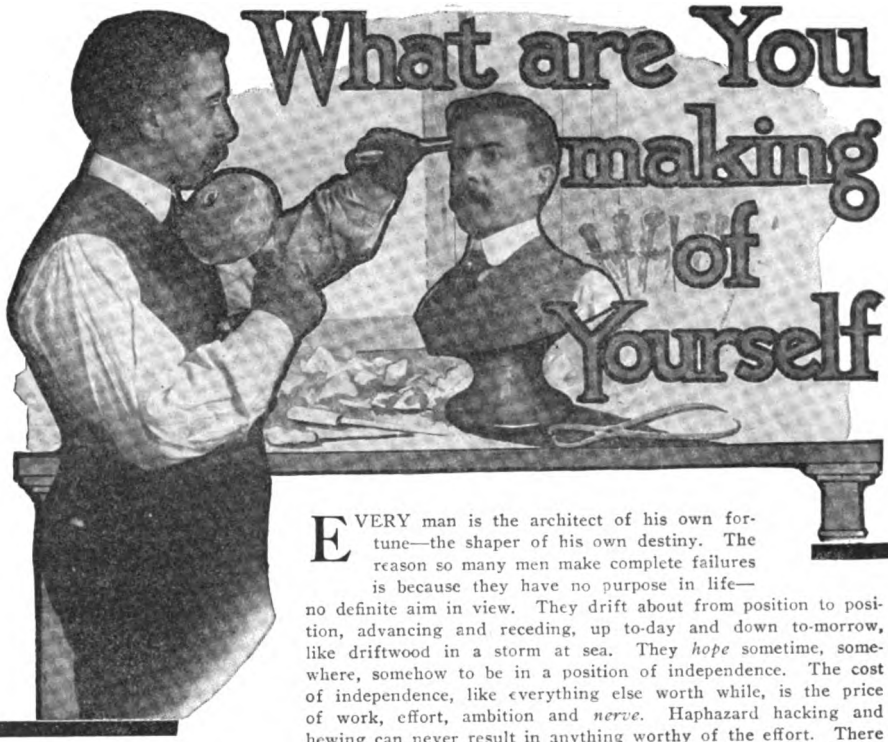
BEWARE OF IMITATIONS

For the protection of our customers we advise that Klein's Pliers are being imitated to LOOK LIKE KLEIN'S. This, however, does not make them Klein's. CAUTION Look for this stamp, M. KLEIN & SONS, on the inside of handles—NONE are genuine without this stamp.

Use only genuine Klein's. They are the product of years of experience and have stood the test of time.

MATHIAS KLEIN & SONS · CHICAGO, ILL.



EVERY man is the architect of his own fortune—the shaper of his own destiny. The reason so many men make complete failures is because they have no purpose in life—no definite aim in view. They drift about from position to position, advancing and receding, up to-day and down to-morrow, like driftwood in a storm at sea. They *hope* sometime, somewhere, somehow to be in a position of independence. The cost of independence, like everything else worth while, is the price of work, effort, ambition and *nerve*. Haphazard hacking and hewing can never result in anything worthy of the effort. There is a natural "bent" in every man's character. Find that "bent" in your character, follow it, and you will be successful in life. No artist ever put brush to canvas without a very definite idea of the picture he intended to paint. No sculptor ever took chisel in hand without a well defined purpose in view.

What are you making of yourself? In your father's time the man who failed to get an education in his youth was handicapped for the rest of his life. That was before the day of the Correspondence School. *Now* all that you need to do to become master of a trade or profession of your own choice is merely to let us know your natural "bent" and let us develop it for you.

The public is rapidly awakening to the value of the telephone. The introduction of the telephone into small rural towns—the adoption of it by the farmer—the rapid erection of new office buildings—all mean an unlimited amount of work for the telephone man. Why not thoroughly understand telephony and be able to superintend jobs instead of being a common "hand"? Our course in Telephony is not equaled—it teaches everything pertaining to Telephone work—nothing omitted. Everything explained in such a plain and easy manner that any one can master it. Only a few hours of your spare time required occasionally.

Write to-day for our 200 page *FREE* handbook, handsomely illustrated with diagrams, photographs and charts describing our 60 Engineering and Technical courses. This is your opportunity. Grasp it now.

WE EMPLOY NO AGENTS

to bother you with repeated calls at your home or place of business. We talk to you only by mail. The money you pay us is not used to maintain an expensive organization of high-priced agents, but is used to give you better instructions at a lower cost.

Tell us what course you are most interested in, and receive Free (if you mention American Telephone Journal) our 200-page hand-book fully describing it.

CLAIMS FULFILLED

Viewed from the standpoint of scientific theory, no other storage battery plate can compare, detail for detail, with the Gould Integral Plate. Many of the largest Telephone Companies in the United States have purchased Gould Storage Batteries on the *very apparent* merit of our battery. It is a most significant fact that in almost every such case *repeat orders* have followed the first test order. The Gould Battery has succeeded because it has made good our claims for its unusual merit and economy.

Write for our catalogues.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

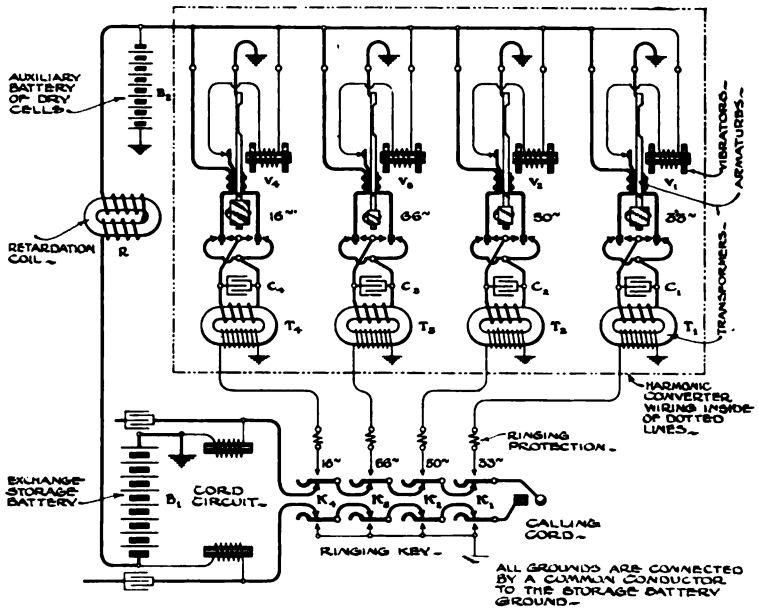
DEAN TELEPHONE APPARATUS



Theoretical Circuit Dean 5 Contact Type Harmonic Converter.

A Party Line Selective Ringer

THE DEAN HARMONIC CONVERTER VIBRATORS

This harmonic converter operates from any direct current source and is made for any size exchange, local or common battery, requiring only one fiftieth of the current consumed to operate a motor generator set of equal capacity. The vibrators (four in number for a 4-party selective ringing) are made from the best material obtainable, being mounted on individual high grade slate bases and so mounted, in a highly finished cabinet, as to be practically noiseless in operation. All parts are standard and interchangeable. The insulation is extremely high and the spring contact points are made of very heavy platinum.

Those interested in LARGE or SMALL exchanges will find it to their advantage to investigate the Dean Harmonic Vibrator and compare it with their present ringing machines. Bulletin 102B mailed upon request.

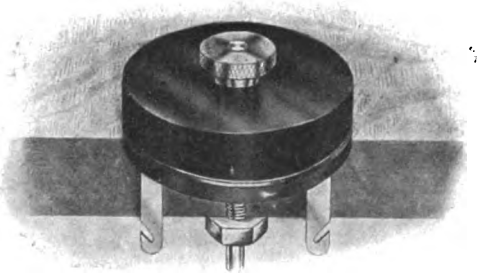
TELEPHONE APPARATUS

KELLOGG COMPACT DRY CELL TYPE TELEPHONES

CONTAIN THE KELLOGG LIGHTNING ARRESTER



Our No. 3 Arrester, furnished on all our telephones, is of the self-contained type with terminals made to be projected through the woodwork and soldered to the line binding posts of the telephone. The Arrester is fastened in place by a hexagonal nut screwed down from the ground terminal and no electrical connections are dependent on the woodwork for good contact. The mica separator is held in place under the carbon block by a hexagonal nut directly opposite to that previously mentioned. It cannot become misplaced. The carbon block is made in disc shape and supported in the center, making the cleaning of the Arrester from carbon dust very easy.

Let our Department A furnish you with our Bulletins and prices on Magneto Apparatus. We solicit your correspondence.

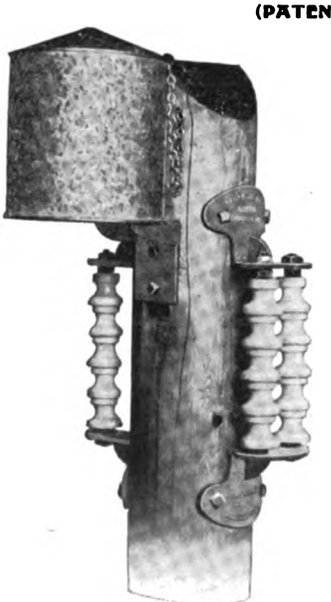
ROBINSON DISTRIBUTION RACK

(PATENTED)



This cut shows the ROBINSON RACK as used in connection with Can Top. Its extreme flexibility makes the Robinson Rack a most desirable method for distribution. No waste of insulation. Costs 50 per cent less than circle top. Easy to trace circuits. Can distribute five pairs from one side of pole; ten pairs from opposite side. Notice special drip feature.

Let us send you circulars and prices.

AS AN INVESTMENT

there's nothing more safe, more sure, more profitable—in the telephone business—than the securities of an Independent telephone company operating our AUTOMATIC TELEPHONE SYSTEM—

BECAUSE it gives more service, better service, prompter service, more accurate service than a manual system (and also an absolutely secret service, which no manual system can give) and

BECAUSE it costs less to operate, less to maintain, less to enlarge than a manual system, or

TO SUM IT ALL UP, the AUTOMATIC TELEPHONE SYSTEM produces a better telephone service, commanding a higher price, at less cost than inferior service can be produced for by a manual system.

THAT IS THE REASON WHY the AUTOMATIC TELEPHONE SYSTEM makes the securities of the company using it safe, stable and profitable, and why it has been adopted by the Independent telephone companies in the following cities:

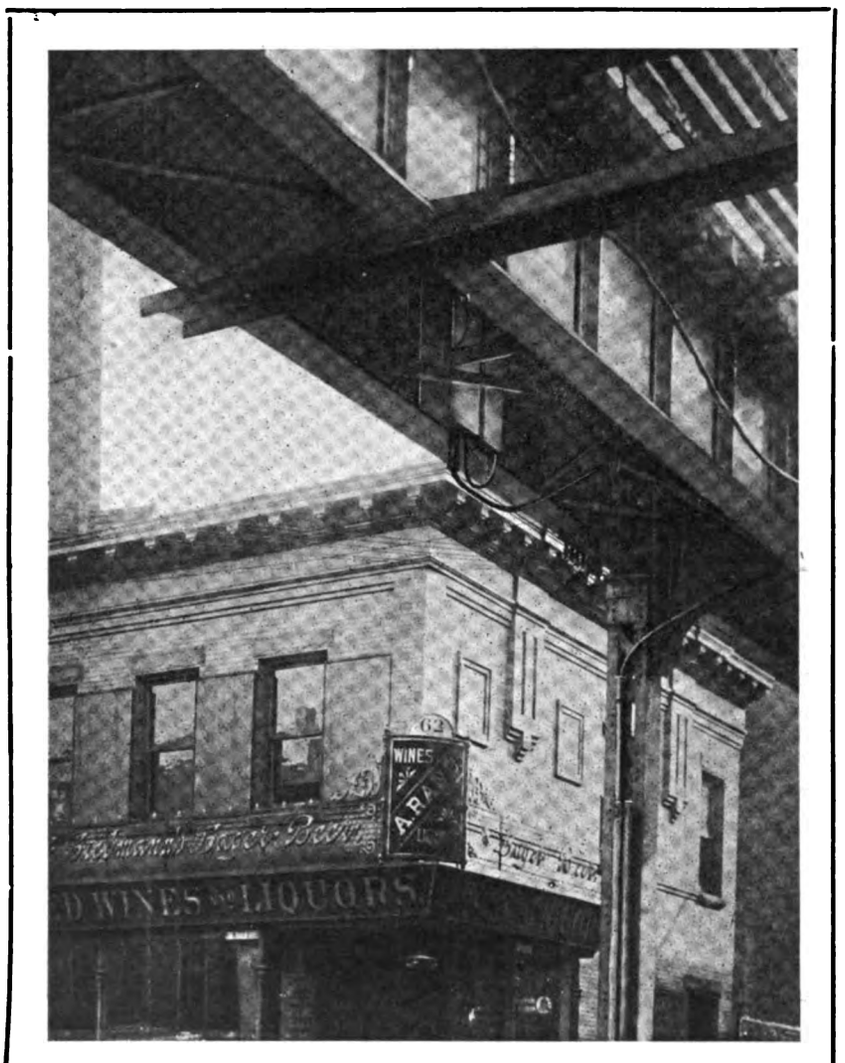
Elevated Railroad Distribution of Telephone Wires in Brooklyn

By Walter Graham.

BROOKLYN, N. Y., is a city which has a very extensive system of elevated railroads, which starts from the Brooklyn Bridge, by which connection is made with the transportation systems of New York City, and traverses the entire borough, extending out into some of its most populous suburbs and covering approximately 68 miles of trackage. This system, started in the early '80's, was first equipped with small steam engines designed after those in use at that time on the elevated railroads of New York, but during the years of 1901-2 it was completely overhauled, equipped with electrical appliances, and converted into an electric road with the customary motors, third rails, etc. At the time when this system was built the telephone company, then an infant concern, had pole lines on many of the streets paralleling the railroad. These pole lines carried numerous grounded circuit lines and were built in a manner which would now be classed as antique construction. The wires distributing from these poles were a continued source of annoyance to the patrons of the elevated road, especially during stormy weather, when they would frequently come tumbling down across the tracks and tie the road up for several hours at a time. These annoyances were borne by the people of Brooklyn for a while, but so many protests were made that the elevated railroad officials began to fume and fuss to have the pole lines abolished. After much parleying over the matter a solution finally loomed in sight and both the railroad officials and the telephone company decided to adopt the scheme of using the elevated structure to support wires and cables in place of the existing pole lines. By this plan the wires could be placed in a position where it would not be necessary for them to be carried above the tracks in any part of the system, doing away with all risk of impeding traffic.



A Typical View of Telephone Cable Led Up to Distributing Box on Brooklyn Elevated Railway.

This scheme was then being used along the roads on Manhattan Island and was considered to be a very efficient and practical method of distribution. At that time it offered so many advantages over the old method that both companies readily saw the benefits to be derived by them and an agreement was duly made giving the telephone company necessary permission to use the structure under certain conditions. Certain stipulations relating to the number of open wires and size of cables, etc., were of course incorporated in the contract.

Those telephone men who take a fair and somewhat reasonable attitude in judging the results, from information now available, are all ready to admit that this method was a good one some years ago when telephones were scarce in Brooklyn; but when the wires are seen to-day, deteriorated by long service and strung carelessly from the structure to the various buildings en route, in many instances without proper supports, telephone men are equally ready to condemn the method as a defacement to a structure in sight of nearly the whole community and likely to be dangerous in some respects.

(To be Continued.)

The Ohio Convention

By L. A. Parrish, Special Correspondent.

THE annual convention of the Ohio Independent Telephone Association, held March 28, at Columbus, was devoted strictly to business. Every county except Hamilton was represented. There were Hamilton County men present, however, but not as official delegates representing a full county organization. President Beam introduced Mayor DeWitt C. Badger of Columbus, who expressed his pleasure at the presence of the telephone men in the city.

Frank L. Beam, Re-elected President of the Ohio Association.

Dwight E. Sapp of Mt. Vernon responded to the address of Mayor Badger in a forceful and eloquent address.

Mr. Sapp was one of the original projectors of the movement and he told the story of the early struggles leading to the present triumphs of the Independents. Mr. Sapp said that when the first meeting of Independent telephone men was held in a back room of the Chittenden Hotel, April 12, 1895, there were but three Independent exchanges in Ohio and these were at Mt. Vernon, Norwalk and Chillicothe. To-day, he said, the combined capital stock of the Independent telephone lines of Ohio is over $35,000,000. The three exchanges have grown into a system having 835 exchanges, and there are now 1,663 toll stations, while the number of telephones in service in the Buckeye State is 270,720. The number of stockholders has risen from a hundred to 24,050. Independent lines and exchanges are now serving every county of the 88 counties in the State except Hamilton County.

The annual address of President Frank L. Beam showed in detail the work he has carried on for the Association during the past year, as well as the amazing progress made. He said that the strenuous competition of the past year has not only improved the telephone service but it has lessened prices. Securities of Independent companies have advanced to a point where no better securities can be found on the market than theirs. Although so much has been done in the past he urged continued activity, and the most hearty co-operation among officials and stockholders until the State shall be fully developed. He said that at the present time every county except Hamilton shows a network of Independent wires. Even Hamilton County has a few Independent lines, and will inevitably be fully built in the future as the interests of the business men require such connections. His address was most enthusiastically received and heartily applauded by the members at its close.

W. Gilbert Thompson, Manager of the Hamilton Home Tel. Co., Who Took a Prominent Part in the Proceedings.

The following committees were named by President Beam to assist in expediting the work of the convention:

Auditing—George H. Metheany, Lima; J. B. Rhodes, Zanesville; George A. Ford, Toledo.

Nominations—R. E. Hamblin, Toledo; A. J. Cullen, Elyria; G. A. Thorpe, Wilmington.

Legislation—W. G. Thompson, Hamilton; Dwight E. Sapp, Mt. Vernon; Joseph L. Brailey, Jr., Toledo; Frank A. Davis, Columbus; C. Y. McVey, Cleveland.

Constitutional Amendments—W. L. Carey, Jr., Cleveland; H. P. Folsom, Circleville; H. C. Devine, Mt. Vernon.

The secretary of the Association, O. O. Welsheimer, said he was not quite prepared to make his report to the convention owing to the fact that through the floods and other contingencies reports to him had been delayed. He promised that a full and complete report of all the transactions of their representatives would be mailed within 60 days.

Treasurer Ralph Reamer reported that the outlook financially was good.

President J. B. Hoge of the International Independent Telephone Association opened the afternoon session with a statement of present conditions of the telephone business from the standpoint of the International organization.

Unusual interest was shown in the address of J. H. Ainsworth of Dayton, superintendent of the Independent system of that city. Until a year ago, Mr. Ainsworth was one of the most ardent advocates of the single telephone system. As manager of the Bell system of Columbus, for a number of years in Columbus, he was one of the most prominent opponents of the Independent movement in Ohio. He said, in part, on the subject "Changed Conditions":

Ralph Reamer, Re-elected Treasurer of the Association.

"I think your Honored President had designs in inflicting me upon you with such a subject, because he knows of my own recent change of condition, for, as an Independent telephone man, I am only nine months old. I began my telephonic managerial experience in 1888 with the Bell company in a town of 4,000 population, and my first exchange had just 29 subscribers (not counting extensions as is present Bell practice). The rates were $48.00 per year for business and $36.00 per year for residence within ¼ mile of the central office, and, although we had party lines, they were not operated on the give and take principle as

Digitized by Google

now—the company saving its cable and pole line and switchboard space and granting the subscriber a better rate because of the character of the service—not on your transmitter—they charged you more the farther you were away, and I had one subscriber who paid $9.00 per month, but conditions have changed.

"Those were the days of the Blake transmitter, which worked so well that when this subscriber of mine, whose office was just across the street, talked to his $9.00 per month telephone at his coal mine, he might just as well have stuck his head out of the window and conversed with the wide, wide world, and his conversation was almost a disturbance to the neighborhood, it was necessary to talk so loud. But conditions have changed, and he now talks with his people over long distance transmitters, and transmitters, thank goodness, good transmitters, made west of the Hudson River. Those were days when a manager did not dare to order a new set of instruments until he had a contract signed up, binding the prospective subscriber down hand and foot, lest he change his mind, refuse to take the instrument and the poor, struggling licensee company have to pay the royalty anyhow, at least until the instrument could be sent back to Milk street.

"Changed conditions in the business brought changed positions to me. Competition came in and I grew strong in argument against the double telephone nuisance, the useless waste of money, the economic mistake, the step backward in telephone practice, which was embodied in the competitor, enlarged upon his lack of knowledge, and of money and men, and I came to this city of Columbus. Here in my office one day, as I conversed with a prominent man and pointed out the misfortune of double telephone service, in the midst of a statement that it was financial foolishness and telephonic folly to keep two telephones, he stopped me and said, 'How many telephones have you in Columbus?' I answered, '9,000.' 'How many has the Independent Company in Columbus?' said he, and I answered 'approximately 9,000.' 'How many are duplicates,' he asked, 'that is, how many keep both?' I answered 'about 2,000.'

"'Can it be possible, then,' said he, 'that you each serve me with exclusive connection with 7,000 business houses and families?' I said, 'yes.' 'And is it not true,' said he, 'that I should be able to reach with greater ease the 2,000 business houses and families which have both telephones?' Again I answered truthfully 'yes.' 'Then,' said he, 'I am actually getting for the money I pay connection with 18,000 telephones in all, or 16,000 not counting the duplication. Now,' he continued, 'let's see —I pay your company $60.00 per year and I pay the Citizens' Company $40.00 per year, which makes $100 per year, or a little more than 5½ mills per telephone per year. Before the Citizens' Company started I paid the Bell Company $72 for a Blake transmitter with a noisy circuit, received connection with, as nearly as I can remember, from 1,200 to 1,800 telephones. Then the long distance transmitter came in and I paid $96.00 per year for a long distance equipment and a metallic circuit, and was given connection with from 1,800 to 4,000 subscribers, or at the rate of 2 4-10 cents per telephone per year. Now, unless I am badly off in my figures, I seem to be getting for $4.00 per year more than I formerly paid, not only connection with the 4,000 whom I already reached, but 12,000 on top of them.'

G. R. Johnston, General Manager Columbus Citizens Telephone Co., Who Contributed Much to the Success of the Meeting.

E. L. Barber, of Wauseon, Who Has Built Up Many of Ohio's Successful Telephone Companies.

J. B. Rhodes, of Zanesville, Who Represented District No. 3.

"What is true of Columbus is true of every other town where the Independent company has come to the rescue of the people, and Cincinnati's business men are beginning to realize that they have been buncoed too long. Cincinnati, thinking herself alive, is telephonically ten years behind her sister cities, and, at a conservative estimate, is losing the appalling sum of $10,000,000.00 yearly in trade, and millions more in excessive telephone charges. Unless she gets right on the telephone question, along with Omaha, Denver, Chicago, Milwaukee, Cleveland, Pittsburg, St. Louis, Buffalo, Philadelphia, and even Boston unless she recognizes the changed conditions, she will be run over in a business way."

Cyrus Huling of Columbus contributed an instructive address on telephone securities, comparing the present demand for telephone stocks with the trouble financiers had ten and twelve years ago in floating the paper of any new telephone venture. Mr. Huling has made a study of this question and his conclusions on the subject were received with considerable pleasure and profit.

With considerable applause and expressions of approval Mr. Stacey B. Rankin of South Charleston presented his views on "Co-operation between Local and Long Distance Companies."

Mr. Rankin said: "Many local companies do not give proper attention to maintenance of instruments and switchboards; allowing batteries to become worn out; allowing dust to accumulate in the jacks and drops of the switchboard; also allowing the slack to remain in the lines; not properly guying corners; not properly insulating local lines away from the high potential currents and trees; also allowing cables to become grounded, making noisy lines, and many conditions of this sort. The only way to give first class long distance service is, that local com-

Digitized by Google

panies, as well as the long distance lines, be in first class working condition. Local companies should build with good sized wire, properly insulated and away from high tension wires."

Mr. Rankin advised the men to look after all these points and the weak links would disappear.

He also suggested that mutual care and attention in every particular should be given by all to every call and thus increase harmony, efficiency and business.

One of the most vigorous and energetic addresses of the day was by James S. Brailey, Jr., of Toledo. Mr. Brailey's subject was "The Independent Telephone in the Public Eye."

Mr. Folsom made an eloquent plea for the Independent telephone men to get together and prevent any inroads into their ranks. He urged the members to get together on the line of policy to be pursued and stand loyally with one another.

Judge C. B. Matthews of Cincinnati, attorney for the Queen City Telephone Company, was introduced by President Beam to talk on the subject "Telephone Law in Ohio." In opening his address Judge Matthews said;

"I have thought the patent office fails in one of its most important objects, namely, to stimulate and reward inventors and thus subserve the good of the people. In 75 cases out of 100 I have observed, especially in the most valuable and important, the inventor dies in poverty, while some grasping money shark or corporation has garnered in the millions."

The speaker then showed some of the injustices of the laws of Ohio and lucidly explained the situation in Cincinnati, where the injustice of the law relating to the placing of conduits underground was shown up. Judge Matthews gave a history of some of the legal obstacles thrown in the way of the Independents in the recent contest waged by the Independent company to force an entrance into Cincinnati.

He urged the Association to be alert in watching future legislation and to strive to repeal the obnoxious and unfair laws evidently placed on the statute books by influences hostile to Independent telephone companies.

W. W. Fisher of Bellefontaine then addressed the convention on the subject of consolidation of the interests of Independent telephone companies.

One of the most practical papers was a lengthy discussion of the question of the "Sterilization and Preservation of Telephone and Telegraph Poles," by H. P. Folsom, of Circleville. Mr. Folsom considered this one of the greatest problems now confronting the management, and he believed one of the largest items of depreciation of outside construction to be caused by the rotting of the poles. His paper will appear in an early issue of THE AMERICAN TELEPHONE JOURNAL.

The formal part of the program closed with an address by Judge James A. Allread, of Greenville, on the subject "Power and Force of the Independent Telephone Association of Ohio." Judge Allread's address was not lengthy but it was full of meat. He gave a brief description of the rapid rise of the Association, its gradual resolution into a distinct form, its growth into a formidable financial institution, whose value and weight are due to co-operation.

At the close of the formal discussion of the program President Beam called for questions or informal discussion on any point suggested by any address on the program. President James B. Hoge of the International Independent Telephone Association took occasion to open a discussion on the question of the various Farmers' Mutual Telephone companies springing up in various parts of the State and the extent to which they should be countenanced and recognized by the Independent companies. President Hoge desired some sort of an expression of the ideas of the Association to carry to the International convention.

Mr. Hoge said that in some instances these mutual companies were cutting in on Independent territory and becoming competitors of the Independents in a detrimental way. He suggested that many of these companies bought equipment from the same construction companies patronized by the Independent companies with whom they come in competition. Mr. Hoge thought the trouble could be remedied through the supply dealers, who, he understood, would be more than glad to co-operate with the companies in their endeavor to abate the evil.

Washington Hyde of Darke county took issue with the idea. He said the Farmers' Mutual companies have as much right to build, operate and construct telephone plants as anybody in the country. He eloquently appealed to the convention to give fair play to these men who were only now on the ground occupied in the beginning by the Independents. He said they were up in his part of the country thick, and that one company was building a toll line from Warren.

"Let us not antagonize them," said Mr. Hyde. "Let us line up with them. We give free exchange service to one of these companies and the other day the company wanted to sell its plant to us. The problem will work itself out in time. Another rural company, and a joint stock company, too, with over 100 telephones, made a contract with us for $4 per telephone for our service. Soon they will prefer to turn over their plant to us, and in fact offered to sell out to us. 'We are farmers,' they said, 'and you are business men. We do not want to run this business.'

"Let them run the business. It educates them. When we go into new territory we have to educate the people to the use of telephones. Now, why not allow them to educate themselves? Encourage them to do so and it will pay. They will consider us their friends. The Bell people tried to get the same people I have mentioned to do business with them. If we hadn't got them the Bell people would. I would urge this convention to take no such step as contemplated."

Mr. A. W. Richardson of Salem, Columbiana county, gave a vigorous address along the same line. He said the convention should be cautious about how it antagonizes these people. "We want their trade," said he. "They go into the business as we did. Shall we antagonize them as the Bell did us? It's a means of educating the farmers to the benefits of the telephone. Be careful. It may be the beginning of our end."

Colonel W. D. Rush of Greenville stated that he had been misunderstood as to his remarks on the subject, it not being his intention to antagonize Farmers' Mutual companies who open up new territory. His idea was to prevent these companies from reaching out into territory already developed, as had been done in his section of the State, and seeking to run out Independent telephones to install the Mutuals. This would in no case antagonize the friends of the Independent movement, and as for the Mutuals who wage war on the Independents, they are as much the enemies of the Independents as the monopoly companies and should be treated as such.

The discussion was then closed and the report of the nominating committee was called for and made by the chairman.

Officers were then elected as follows: President, Frank L. Beam of Mt. Vernon and Columbus (re-elected); secretary, O. O. Welsheimer, Columbus; treasurer, Ralph Reamer, Columbus.

Delegates at large to the International Independent Telephone Association convention in Chicago next June: Frank L. Beam, Columbus; Dwight E. Sapp, Mt. Vernon; James B. Hoge, Cleveland; James S. Brailey, Jr., Toledo; W. Gilbert Thompson, Hamilton; H. P. Folsom, Circleville; I. H. Thiedieck, Sidney; G. P. Thorpe, Wilmington; J. B. Rhodes, Zanesville; C. Y. McVey, Cleveland; Louis Brucker, Mansfield; Cyrus Huling, Columbus; Frank A. Davis, Columbus; Washington Hyde, Warren; D. M Odaffer, Marion; R. E. Hamblin, Toledo; Charles Hollender, Newark; George M. Adams, Millersburg.

The alternates at large were also selected as follows: L. H. Beatty, Ravenna; H. L. Clark, Ada; W. W. Morrison, Toledo; C. L. Norton, Cleveland; Leo. Fiehr, Piqua; Dr. C. Jones, Athens; A. J. Curren, Elyria; A. V. Hageman, Lorain; William Hoyle, Cambridge; L. George, Wapakoneta; Clarence Brown, Toledo; C. H. Granel, Painesville; C. R. Newberry, Ashtabula; J. K. Johnston, Sandusky; D. A. Yoder, Bowling Green; D. E. Fuller, Clyde; E. E. Knox, Portsmouth; C. H. Marvin, Urbana.

The district delegates were named as follows: District No. 1, F. A. Knapp, Bellevue; E. L. Coen, Vermillion; District No. 2, W. F. Laubach, Akron; J. F. Smith, Cadiz; District No. 3, A. H.

Digitized by Google

Doudna, Bridgeport; A. B. Hobson, Flushing; District No. 4, H. A. Marting, Ironton; G. A. Schleyer, Circleville; District No. 5, William B. Fee, Milford; Charles E. Biehn, Georgetown; District No. 6, John H. Ainsworth, Dayton; W. W. Fisher, Bellefontaine; District No. 7, George H. Metheany, Lima; J. A. Longwell, Van Wert; District No. 8, E. L. Barber, Wauseon; J. A. Steinkamp, Elmore; District No. 9, G. R. Johnston, Columbus, A. A. Whitney, Mt. Gilead.

Mr. Beam was called out for a speech and he gave a short talk thanking the convention for the honor bestowed and bespeaking the same hearty co-operation and support accorded him by members and officers as in the past.

The committee on constitution then made a report, making but one recommendation. That was that the constitution be changed so as to permit of an earlier date for the convention, arranging it so the date would fall more nearly the middle of March. The present date was so near the end of a quarter that it prevented the attendance of bankers and loan and real estate men's associations because of quarterly settlements. The convention adopted the report and placed the convention date on the third Thursday in March instead of the last Thursday.

The convention then adjourned.

The annual banquet was one of the most enjoyable events of the Association's social career. Two hundred members and guests sat at table together and enjoyed an excellent and altogether satisfying menu and listened to as bright and interesting a program of wit, oratory and music as every delighted a body of men on an occasion of the kind. No sort of drink was served, as usual, except water and coffee, and ministers, bankers, farmers, newspaper men, lawyers, physicians, in fact, men from nearly every profession and walk in life, sat together to enjoy the occasion.

Mr. Dwight E. Sapp of Mt. Vernon presided as toastmaster and filled the station with credit.

Governor Harris responded to the toast "Ohio." Clarence Brown of Toledo responded to the toast "Telephone Situation from the Point of View of the Professional and Business Man" in a brilliant speech.

Rev. Dr. S. S. Palmer of the Presbyterian Church, a local minister noted for his aptness at speechmaking, captivated his hearers by his response to the toast on "Modern Miracles."

The "Changed Conditions in Telephone Securities" were shown by Henry A. Lanman, who related that when he with his confreres went to New York to try to float the Columbus Citizens' Company project they were told that the bankers and financiers were not taking on that kind of securities at that present time. Now millions and millions of securities are "digested" with amazing relish and the cry is for more.

"The Wireless Telephone" received treatment at the hands of Norman C. McLoud of Cleveland.

Hon. C. R. Krickenberger said "Hello" in a short response to the toast and Dr. Alfred Robinson answered to the toast "Pride," and showed up the pride of the Independents in their business.

Interspersed with these able and witty responses were solos and songs by the quartet and at 1 o'clock a. m. the quartet sang the final "Good Night."

Rural Party Line Ringing Codes*

ONE of the best things this discussion of ringing codes is bringing out is the objection entertained by many of the best telephone men to the overloading of lines with too great a number of instruments. Herbert L. Moor, general manager of the Vermont People's Telephone Company, Barton Landing, Vt., writes that twenty telephones are as many as his company cares to put on one line. "We use ring numbers from 2 to 6, 11 to 14, 21 to 24, 31 to 34 and 41 to 43. In the rings from 11 to 43 the first figure denotes the number of long rings, the second the number of short rings—as 31, three long, one short. Ring numbers are separated from line numbers by a dash when printed in the directory."

A code requiring memorization by the operator, but designed to give a minimum number of rings for each call is contributed by C. E. McCormick, general manager the People's Telephone Company, Shepherdsville, Ky. He writes: "As in many others the line number is separated from the ringing number by a dash. As worked out we believe this code has the advantages of simplicity and brevity, and it may be easily learned. All that the operator has to memorize is that 1 means one long ring, 2 means two short rings, 3 one short and one long, and 4 one long followed by one short. A complete code for a 19 party line, No. 14, works out as shown in table 1.

14-1 —	14-12 — · ·	14-24 · · — ·	14-41 — · —
14-2 · ·	14-14 — — ·	14-31 · — —	14-42 — · · ·
14-3 · —	14-21 · · —	14-32 · — · ·	14-43 — · · —
14-4 — ·	14-22 · · · ·	14-33 · — · —	14-44 — · — ·
14-11 — —	14-23 · · · —	14-34 · — — ·	

Table 1.

"It will be noticed that ring 13 has been omitted, because it is the same as 41."

Ernest A. English, Hartland, Vt., mentions several systems. Concerning the use of the code using "Morse" telegraph letters he says: "Such a code is not satisfactory because there are too many letters which are hard to distinguish from each other. Another method is to let figures 1-5 represent short rings and 6-9 long rings, 6 standing for one long ring, 7 for two long rings, etc. Codes may be made up in any desired way from combinations of these figures. His experience indicates that a better method than either of these consists in letting the figures represent the number of rings and their position the length of rings. Thus a figure in the unit position may represent short rings,

1 — ·	6 · · · · · ·	14 — · · · · ·	19 — · —
2 · ·	7 · · · · · · ·	15 · —	20 — — ·
3 · · ·	11 — · ·	16 · · —	21 — — · ·
4 · · · ·	12 — · · ·	17 · · · —	22 — — · · ·
5 · · · · ·	13 — · · · ·	18 · · · · —	30 — — — ·

Table 2.

those in the tens position long, hundreds short and thousands long. For example, 2131 would mean two short, one long, three short, one long. It is to be noted that he puts short rings first, a practice to which many other correspondents raise objections. When a call begins with a long ring he inserts a cipher (0) in the units place. The use of only two numerals will give a code sufficient for the number of instruments on most lines by the use of different figures 2-5, 11-14, 21-24, 31-34, then hundreds and tens with a cipher in the units place, pronounced as the letter *o* in passing the call. These numbers are used as there should in no case be used a combination having more than five short and four long rings together. He states, however, that "It has been well proven to me that it is not satisfactory to use more telephones on a line than can be listed without going beyond the units and tens."

B. D. Hursh, superintendent and manager of the Stroudsburg and Bushkill Telephone Company, Stroudsburg, Pa., sends the code shown in table 2, ring numbers only being shown.

He states that one ring is made the exchange ring, and consequently 1 in the code represents a long and a short ring.

*Continued from previous issues.

Digitized by Google

For other figures up to 10 a corresponding number of short rings is used, although he has never assigned any number above 7. Above 20 are three numbers designed "for a pinch," which afterward became standard. Concerning selective party lines he frankly says: "Letters were used instead of ringing button colors, as it is essential to distinguish them from code lines and we were not 'up to' the color scheme."

A code of the type whch requires memorization, using a unique set of figures, is used by W. S. Gates, Ida, Mich. It is shown in table 3:

Central —	23 — · ·	30 · ·	16 · — — —
40 — —	25 — · · ·	50 · · ·	32 · · —
60 — — —	41 — — ·	70 · · · ·	34 · · — —
80 — — — —	43 — — · ·	12 · —	52 · · · —
21 — ·	61 — — — ·	14 · — —	

Table 3.

The plan behind this code is as follows:

Numbers terminating in 0 have all rings of the same length; odd numbers indicate short rings; even numbers indicate long rings. The number of rings is determined by the position of the number in a sequence of odd or even numbers respectively,, as 2, one long; 4, two long; 6, three long; 1, one short; 3 two short; 5, three short. When this is understood no further memorization is necessary, an operator knowing instantly that 34 means two short and two long rings.

INDEPENDENT TELEPHONY IN TEXAS.

D. A. WALKER, who is president and general manager of the Independent telephone companies at San Antonio, Austin, Taylor, Temple, Belton and Tyler, Tex., in a recent letter to THE AMERICAN TELEPHONE JOURNAL, throws an interesting light on conditions in the State where he has such large interests. He writes, in part:

"In this State the Bell Company had a monopoly of the telephone business for years, and not until 1900 was there any concerted move towards competition on the part of the Independent telephone companies. During the year 1901 a large amount of capital from the Northern States was invested in Independent telephone plants throughout Texas. Wherever the Independents secured a franchise the Bell Company would immediately reduce its rates, which were at that time considered to be nothing less than extortionate, and attempt to improve its service, but would always maintain their high rate and poor service in places where they had no competition. As a result of this policy there are now nearly four hundred Independent companies operating in the State, furnishing service in every important city, with but one exception.

"Several bills are now before the Texas Legislature providing for the regulation of the telephone business throughout the State. One of these bills provides that no telephone company shall grant any frank or give any free service to any person or corporation not directly connected with the telephone company, and this is a just measure which should become a law. The Bell Company is very generous in a way, and, for reasons best known to itself, issues franks over its long-distance lines and furnishes free telephone service to any person or corporation which it thinks can or will lend it any assistance in stifling the Independent movement or in destroying the Independent companies with which it competes.

"The State of Texas requires all telephone companies to pay into the State treasury one and one-half per cent. of its gross receipts. Under this law there was paid to the State by the telephone companies during the quarter ending December 31 the sum of $17,703, which shows a gross business for the quarter of $1,200,000, or a gross business for the year of nearly $5,000,000. The importance of the interests which pay this large revenue is attracting the attention of the Governor and members of the Legislature, all of whom seem to be earnest in their efforts to break the monopoly that the Bell company has held on the people and to give the Independent telephone companies an equal chance to carry on their business. We are hopeful that before the Legislature adjourns that such laws will be enacted that the Bell Company will be compelled to give good service at reasonable prices, and meet the Independent people on an honest basis, and be forced to conduct an open, honest and fair competition."

Telephone Legislation in 1907*

NEW JERSEY.

SENATE BILL No. 57, introduced by Mr. Minturn, January 28, 1907, and referred to Committee on Municipal Corporations, is an act to empower cities to construct subways or conduits for the use of all telephone, telegraph and trolley wires and to order that such wires shall be placed in these conduits under such terms as may reasonably be established.

SENATE BILL No. 10, introduced by Mr. Ackerman, January 14, 1907, and referred to Committee on Municipal Corporations, provides that it shall be unlawful for any telephone company to erect poles or string wires in any public roads without first obtaining from the proper authorities permission, and also obtaining written consent from all the owners; this act to apply both to new lines and the extension of existing lines.

SENATE BILL No. 106, introduced by Mr. Cornish, March 4, 1907, and referred to Committee on Railroads and Canals, is a bill limiting the hours of a telephone operator on work connected with the moving of trains to not over eight hours in any twenty-four consecutive hours.

NEW YORK.

ASSEMBLY BILL No. 1144, introduced by Mr. Cuvillier, February 28, 1907, and referred to Committee on Electricity, Gas and Water Supply, provides that it shall be unlawful for any telephone company to charge for cities having a population of ten thousand or more inhabitants a rate greater than $2.00 per month for business or residence telephone service. A similar limiting provision is applied to systems operating outside of such cities, and toll rates are limited during the day to a rate of one-quarter of one cent per mile, with one-half that rate for night messages.

ASSEMBLY BILL NO. 1,538, introduced by Mr. Cuvillier, March 14, 1907, and referred to Committee on Judiciary, is a bill to make telephone companies common carriers under the supervision of the railroad commissioners, who shall have power to inquire into complaints, discriminations and all cases of neglect or violation of the laws governing common carriers. The power of the commissioners extends to the regulation of rates, and it is provided that it shall be their duty to require all telephone companies to make connections in each town with the systems of all other persons or companies carrying on a telephone business in the same town.

ASSEMBLY BILL No. 973, introduced by Mr. Cuvillier, February 27, 1907, and referred to Committee on Railroads, provides that telephone operators having to do work connected with the control of trains shall not remain on duty for more than eight in any twenty-four consecutive hours.

HOUSE BILL No. 605, introduced by Mr. Nevins, February 6, 1907, and referred to the Committee on Affairs of Villages, is an act to amend the village law in relation to telephone poles and wires in the streets and public places, and relating to the granting of franchises, which is prohibited until the question shall have been submitted to the qualified electors of the village at an annual election, or at a special election duly called and held for the purpose.

ASSEMBLY BILL No. 1,406, introduced by Mr. Lewis, March 25, 1907, and referred to Committee on Electricity, Gas and Water Supply, is an Act to amend the transportation corporations laws to compel any telephone company to install within thirty days of the receipt of a request a telephone in any building within five hundred feet of its poles or conduits. One section of the amendment provides that a request for the installation of the instrument shall be accompanied by a sum of money equivalent to the minimum charge for the use of the instrument for a period of one year.

NORTH DAKOTA.

SENATE BILL No. 300, introduced by Mr. Talcott, provides that after the passage of the act no person or corporation shall be permitted to conduct a telephone business until the proper license has been obtained as prescribed in the act. The license as originally obtained shall be subject to annual renewal after January 1, 1909. Application for license is in the form of a contract, which provides for the charging of like fees for like service to all persons, prohibits rebates, provides for physical connection with other systems operating in the same towns, and an interchange of service on a fair basis. District courts are to be given jurisdiction of suits necessary because of the operation of this law.

HOUSE BILL No. 284, introduced by Committee on Taxation and Tax Laws, provides that telephone companies shall make and file with the State

*Continued from the issue of April 6.

Digitized by Google

Auditor between the first and thirtieth days of June a statement containing the name of the company, its nature, whether a person, association or corporation, location of its principal office, name and post-office address of the president, secretary, auditor, treasurer, superintendent and general manager, the chief officer or managing agent in North Dakota; the number of shares of capital stock, the par and market values, a detailed statement of real estate, with its value, and an inventory of personal property; also the entire gross receipts of the company for the preceding year for each office and the total, with the operating and other expenses of the company, the balance of profit or loss, statistics giving the entire length of lines in the entire State, and in each county, and such other information as the State Auditor may require. The object of these requirements is to enable the State Board of Equalization to ascertain the value of the property liable to taxation.

Other provisions of the bill relate to the apportionment of the taxes and assessments on the valuation which is thus determined.

SENATE BILL No. 23, introduced by Mr. Young, is designed to make it unlawful for any telephone company to give or offer franking privileges.

HOUSE BILL No. 232, introduced by Mr. W. E. Martin, makes it a misdemeanor to wilfully take down, remove, injure or obstruct telephone lines or wires.

OREGON.

SENATE BILL No. 162, introduced by Senator Malarkey, January 30, 1907, is an act to amend Section 4750 of Bellinger & Cotton's Annotated Codes and Statutes of Oregon, and relates to the method of fixing the amount of damages in cases where claims are entered by owners of land over which a telephone line passes, and describes the powers of the telephone company under the right of eminent domain, which is conferred by this act.

HOUSE BILL No. 90, introduced by Mr. Campbell, January 21, 1907, declares a telephone company to be a public service corporation, and contains general measures relating to the duties of such a corporation, including those in relation to service, proper apportionment of profits, determinations of capital, etc. Discrimination in the rendering of service or failure to render sufficient service upon reasonable payment are prohibited, and render the company liable to a damage suit.

HOUSE BILL No. 168, introduced by Mr. Moore, January 22, 1907, relates to a method of determining damages to property over which a telephone line passes; also contains provisions concerning the rights of eminent domain as conferred upon telephone companies.

PENNSYLVANIA.

HOUSE BILL No. 372, introduced by Mr. McCullagh, January 28, 1907, and referred to Committee on Municipal Corporations, January 28, 1907, is an act to empower municipal corporations and boroughs to regulate telephone companies and to prescribe their charges.

HOUSE BILL No. 272, introduced by Mr. Osborne, March 7, 1907, and referred to Committee on Municipal Corporations, is an act empowering cities, boroughs and townships of the first class to impose license fees for the erection of any pole upon the highway, and for the maintenance of the pole after its erection. The amount of such fees is prescribed as $1 for the erection of the pole and $1 per annum for its maintenance.

HOUSE BILL No. 275, introduced by Mr. Rex, February 26, 1907, is a bill to repeal the act approved April 17, 1905, and providing for the determination by the Court of Common Pleas of the proper county of all disputes as to the reasonableness of license fees between municipal corporations and telephone companies.

SOUTH DAKOTA.

SENATE BILL No. 111, introduced by Mr. Byrne, is an Act providing for the assessment and taxation of property belonging to telephone, railway, telegraph, express and sleeping car companies. It prescribes the reports which must be made, covering a statement of the property, earnings, dividends, etc., of the company in detail, and outlines the method of assessing based upon such a statement.

WASHINGTON.

HOUSE BILL No. 200, introduced by Mr. Huxtable, January 29, 1907, and referred to Committee on Judiciary, is an act covering the manner of carrying wires across railroad tracks. The Board of County Commissioners in each county is given the power to regulate the stringing of wires at such places, and the minimum height above the tracks permitted is set at 25 feet.

HOUSE BILL No. 346, introduced by Mr. Romaine, February 13, 1907, and referred to Committee on Judiciary, contains two sections, one of which grants the power to cities to regulate the operations of telephone systems; and the second one gives the city the right to regulate tolls and charges of telephone systems.

WEST VIRGINIA.

SENATE BILL No. 192, introduced by Mr. Bailey, February 11, 1907, and referred to Committee on Judiciary, is a bill to amend and re-enact Section 2 of Chapter 42, and to repeal Section 482 of Chapter 54 of the Code of 1899. This act relates to the right of eminent domain, and prescribes that telephone companies must obtain the consent of the county court of the counties through which their lines may pass before making extensions, and also covers the course which must be pursued before building in cities, towns or villages.

HOUSE BILL No. 33, introduced by Mr. McCrum, January 14, 1907, and referred to Committee on Railroads, limits the hours for any telephone operator employed by a railroad in connection with the handling of trains to eight hours in any twenty-four consecutive hours.

SENATE BILL No. 71, introduced by Mr. Silver, January 18, 1907, and referred to Committee on Roads and Navigation, is an act to amend the act approved on the 17th of March, 1891, authorizing telephone companies under certain conditions to erect poles along the county roads. In its amended form the bill provides that telephone companies may erect their poles and wires along any county road with the consent of the county court of the county through which such lines pass, provided that such lines shall not interfere with the public use of the road, or with the fruit and shade trees on private property, and provides further that the consent of the council of cities, towns or villages shall be obtained before such lines are erected.

SENATE BILL No. 6, introduced by Mr. Foreman, January 14, 1907, and referred to Committee on Railroads, is a bill limiting the hours of a telephone operator on work connected with the moving of trains on a railroad to not over eight hours in any twenty-four consecutive hours.

WISCONSIN.

ASSEMBLY BILL No. 293, introduced by Mr. Harrass, February 5, 1907, and referred to Committee on Transportation, is a bill to grant power to the common council of any city of the first class to regulate rates for telephone service.

ASSEMBLY BILL No. 445, introduced by Mr. Harrass, February 8, 1907, relates to the granting by municipal corporations of full power of eminent domain over the property of telephone or public service corporations when such property may impair or inconvenience the use of streets, bridges, etc.

ASSEMBLY BILL No. 298, introduced by Mr. Palmer, February 5, 1907, and referred to Committee on Transportation, is a bill to amend Section 1778, Statutes of 1898. This bill in its amended form relates to the duties of telephone companies in connection with the building and maintaining of their lines along public highways, and provides that no corporation shall have any rights under the act in any city or village until it has obtained a franchise from the city or village as provided by law.

SENATE BILL No. 294, introduced by Senator Morris, February 8, 1907, and referred to Committee on Transportation, relates to conditions under which wires may be strung across railroads.

ASSEMBLY BILL No. 502, introduced by Mr. Coolidge, February 12, 1907, is a bill providing that any telephone company shall, on receipt of a demand from another company doing business in the same city or village, make direct connection for the transmission of messages between the two exchanges. The conditions under which exchange may be effected are described in the bill.

SENATE BILL No. 136, introduced by Senator Rummel, February 6, 1907, and referred to Committee on Transportation, provides that the town council of any city of the first, second, third or fourth class shall have power to establish and regulate rates for telephone service.

(To be continued.)

MORE FIGHTING AGAINST COMPETITION IN TENNESSEE.

THE peace and quiet expected after the enactment of the new telephone law in Tennessee has failed to come and instead there is still some confusion. The legislature passed a law declaring telephone companies public service corporations and declaring that as such they had the right to use the streets of any town or city on the highways of the State without the consent of the local authorities. This opened the way for the Home Telephone Company to get into Nashville, where it had been carrying on a desperate fight with the Cumberland company for two years. Soon after the passage of this bill, however, W. B. Marr and J. B. Jones, taxpayers of Nashville, the former a member of the lower house in the legislature, filed a plea for injunction restraining the Secretary of State from granting a charter to the Home Telephone Company, charging that the new law was unconstitutional. The case was heard by Chancellor Allison at Nashville, that authority declaring the law constitutional and denying the fiat requested. Instead of stopping here the case was immediately carried by the Bell interests to the Supreme Court of the State and is now pending before that court. The Independent interests are only awaiting the favorable decision of this final tribunal for the Home company to begin at once to construct a modern plant and put in a big system in Nashville.

Following the decision of Judge Allison the Secretary of State granted a charter to the Home Telephone Company, which names the capital at $1,000,000. W. C. Polk, R. G. Cooper, H. M. Perry, Geo. S. Parks, Luke Lea and Perkins Baxter are the incorporators.

Pending all this annoyance at Nashville the Home Telegraph Company, the same as the Home Telephone Company, has been pressing the work on its trunk line across Tenessee and within a few days will have a line complete and in operation from Louisville to Birmingham, Ala.

THE EDITOR'S PAGE

WATCHING THE MUTUAL SYSTEMS.

OCCASIONAL misunderstandings, it is to be observed with regret, occur in some sections of the country between the operators of Independent exchanges and those who organize associations which secure to their members a limited telephone service on the mutual principle. There is frequently some doubt as to the attitude which the larger Independent company should take toward the smaller Independent concern which occupies a nook in its territory. Mutual companies are organized for a great variety of reasons, but the principal one in almost every case is the desire to secure, as indicated a moment ago, the benefits of a very low rate on a limited service. Very likely the originators of such movements are in some instances disgruntled subscribers of the Independent company in whose territory they seek to operate, and which they hope to oppose. In such instances the mutual company may, in a small sense, become a competitor with the company with which the interests of its members in reality demand cordial relations. Those who organize mutual companies at the present day should before spending any money for telephone wire and instruments look into some of the broader features of the new business in which they are determined to engage.

It may be safely assumed that the farmers who try to build their own telephone lines are above the average in intelligence and business ability, and pretty well accustomed to dealing with their fellow men, or they would not want to use the telephone at all. When these men are considering means for getting in their harvests more quickly, and more cheaply, by the purchase of modern machinery, they look the matter over pretty carefully before making a decision. A keen buyer will not only talk with his immediate neighbors, but will very likely look around through a whole county to get the experience of other men. When he finally does give his order he is sure that the machine he buys will be useful to him for some years to come. It is just this kind of business sagacity that he needs to apply to his telephone purchases. There is no more need for him to make a jump in the dark in one matter than in the other.

After consulting men who are familiar with the early history of the Independent companies and their development he will find that he will start, if he really does start, in much the same way that all the pioneer companies began to operate. They put in a few telephones to give a neighborhood service. A, B and C wanted to talk to one another, and to nobody else, and they put in telephones on the same line. Then C had some dealings with D, who as a matter of accommodation to C, was taken on to the line, and gradually, one by one, others were added, until the service grew beyond anything which had ever been expected, and a company had to be organized. It is this wonderful tendency of the telephone service to expand, to grow constantly beyond its existing boundaries, that the farmer does not appreciate. Because when without the telephone he always trades at the nearby store he does not realize that he may be able to take advantage of a broader and perhaps cheaper line of goods at the county seat by being able to stand in his own home and talk with the merchants located there.

This is what the men in charge of the town and city Independent companies will do well to bring home to their friends who have the mutual idea. Teach them the telephone business. If they want to build competitive lines in territory already developed let them do it. Their education will progress very rapidly. Their ideas will expand. Like all the other Independent subscribers theirs will continually be demanding a more far-reaching service, and a better service. Their education will cost them money, in such an event, but when they finally are ready to join the regular organized Independents they will be loyal supporters, they will have had an experience in many respects like that of the pioneers, many of whom are now the mainstay of the Independent movement. While they are getting this experience the larger Independent company can be spending its money on its town plant and trunk lines, bringing its plant up to the highest point of efficiency, getting ready for toll business which will bring it, dollar for dollar, larger and quicker returns than the strictly local investment.

When a mutual plan is proposed for the building up of a territory not yet developed by the Independents the education of those who are pushing the movement should not be left wholly to the hard school of experience. It will pay to assist them. Just as soon as the town manager learns that a mutual plant is to be built in his territory he can assume that if he handles his end of the proposition correctly the mutual system will eventually become a feeder to his own, and in such a manner as will be to the advantage of all parties concerned. It is of little use to try to bring about this relation immediately. Probably at the very start neither party really wants it. The thing to do is, without creating any jealousy, or awakening any suspicion of intended injury to the financial interests of the smaller concern, to give such advice as will insure the laying out and building of lines, and use of instruments which after a period of two, three or five years may be properly used in connection with the town exchange and the Independent toll lines. After this, nature can safely be allowed to take its own course—a sharp lookout being maintained, none the less, for Bell sub-licensing agents.

Now there is another thing that is important along this line. Not long ago an article in this Journal described the efforts being made by one of our brightest telephone managers to encourage the use of the large number of rural telephones connected to his exchange for business purposes. He had the territory well developed, and it was his object to show the farmer that it was to his interest to use the telephone as an aid to business, in fact, as a money making instrument, and that the way to do this was, in the main, to use it for conversation with business men in the city. At the moment we have not full knowledge of the situation in his territory, but we are willing to lay ourselves open to contradiction by venturing the opinion that in those parts of his territory where he has accomplished his object there is not today in existence a single Independent mutual company, unless it be one with which his exchange has thoroughly satisfactory contract relations.

SMALL COMPANIES AND THE TOLL LINES.

AT Independent telephone conventions during the present year the consideration of methods of handling toll business and of preparations for this class of work is receiving more attention than ever before. The owners of even the very smallest plants realize that they will soon be able to talk with practically any point within a radius of a thousand miles. The success of the toll business will depend on the full cooperation of the local companies. Consequently the small concerns are doing everything possible to put their lines, instruments and switchboards in the very best condition, which is absolutely essential if they are to be used in handling long haul connections.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

PURCHASING TELEPHONE INSTRUMENTS.

Would I be violating the laws of Tennessee to buy new telephones, or second-handed, and then sell them to others in our company? If so, would I be allowed to order them for others? C. B.

WE know of no law in Tennessee, or of any other State, or of the United States, that would be violated by your buying new or second-hand telephone instruments and selling them to any one you please. Telephone instruments are property like stovewood, potatoes or mules, and can be bought and sold with equal freedom. The patented quality of the instruments makes no difference with the right to deal in them. There would be no legal obstacle to your ordering them for others.

INJURY FROM SAGGING WIRES.

SOME boys about 14 years of age went upon an unenclosed and unimproved tract of rough land covered with trees, brush and weeds, to get some zinc which had been thrown away, in order to sell it for junk. One of the boys came in contact with a wire of an electric company where it had been allowed to sag, and where the insulation had been worn off apparently by contact with a tree, and was instantly killed by the shock. The court held that although the boy was a trespasser on the land, the company was liable because it had known of the dangerous condition of the wire, and that persons were in the habit of going upon the land. Connell vs. Keokuk Electric Ry. & Power Co., 109 N. W., 177.

RESPONSIBILITY OF TELEPHONE OR ELECTRIC LIGHT COMPANY IN ABSENCE OF INSULATION.

I desire to submit for your decision the question as to responsibility of the telephone company or the electric light company in the following case:

The electric light company in our city had a pair of wires carrying 1,100 volts strung from a pole on one side of the street, which had a transformer carrying a pair of wires into a house on the same side of the street, but the wires carried across the street were landed on a house on the opposite side, leading to a transformer before they entered the house. The wires that went from this pole to the house in which the transformer was located carried 1,100 volts. The insulation was very poor on the wires making this circuit—in fact, the wires were bare in a number of places. The telephone company, in the exercise of its right to string wires in the city, was compelled to cross the wires of the light company. Its employees, following the usual custom, threw a rope across the electric light wires, and were pulling the same over the wires in the customary manner when the two wires of the light company, by reason of the pulling of the telephone line over, came together, and, being bare, of course a short circuit was formed and one of the wires burned off. Dropping to the ground, it fell upon a horse standing near the pole, and the horse fell to the ground, and before the wire could be cut, which was done as soon as possible by the telephone company's men, the horse was so severely shocked that he died.

The point in the controversy is whether or not the telephone company is liable because of the action of its employees. We contend not, because we were exercising our rights and following the usual methods of stringing the wire, and the light people had not maintained their wires in good condition, or the accident would not have occurred. It might have occurred even without our employees bringing the wires together, as the wires were very slack and the heavy wind-storm might have blown the wires together and thereby form a short circuit and burn off.

I should be glad to have your valuable opinion upon this statement of facts as to the liability. J. W. B.

IN the above case two points are not mentioned which might be decisive of the question. These are whether the telephone company had permission of the electric company to string the wires in the manner that was followed, and whether the telephone company's employees knew or should have known that the insulation on the wires was poor. If the telephone company had the express or implied permission of the electric light company for its work, we believe the electric light company would be responsible. If, on the other hand, the telephone company, through its employees, knew or should have known that the electric wires were poorly insulated and bare in some places, we think the telephone company would be responsible. In any case, as to the owner of the horse, both companies would probably be jointly liable for its death. In the absence of proper insulation the duty rests upon both the company whose lines are already established and that which is subsequently building to avoid all danger. The telephone company could have compelled the electric light company to properly insulate the wires before it built over them. In the absence of such proper insulation, if it knew, or should have known the situation, it was its duty not to string its wires. We also think that the employees of the telephone company had no right, unless authorized by the electric company, to pull the rope across the electric lines in such a way that the wires came together, even though such was the customary method of doing the work. A case that may be of some assistance on this question is McKay vs. Southern Bell Telephone Company, 111 Ala., 337; 19 S., 695; 31 L. R. A., 589.

ARE PAY STATIONS A NECESSARY PART OF TELEPHONE EQUIPMENT?

THE Cumberland Telegraph & Telephone Company has commenced suit against the City of Louisville, Kentucky, for an injunction to prevent the city from collecting a license tax of one hundred dollars for each of one hundred and sixty-seven pay stations operated by the company, the tax having been fixed by a general ordinance of the council approved November 22. The validity of the ordinance is attacked on the ground that the city had no right to levy a direct tax in addition to the ad valorem tax and franchise tax, and it is further contended that the city is without authority under any circumstances to impose such a tax. A permanent injunction is sought. The company contends that the pay stations are a necessary part of the equipment which they were given authority to install under an act of the legislature incorporating the Cumberland Telephone & Telegraph Company. The ordinances of the city under which the telephone company operates stipulates that it shall have the power to install all appliances and equipment necessary for the conduct of a telephone system.

WHEN A NICKEL-IN-THE-SLOT ATTACHMENT IS PROPER.

AT Des Moines, Iowa, the district court has decided a case involving the question of whether telephone companies can insist on slot machine telephones in business houses. The case was brought by F. S. Aldrich, a pharmacist. The court holds that where a telephone is had for public service, a nickel-in-the-slot attachment is proper, but where it is to be used only for the manager and his employees, a simple telephone may be demanded.

In his opinion the court said: "The court finds that the contract between the plaintiff and the defendant, properly construed, entitles the plaintiff to make a reasonable use of the defendant's instruments and connecting wires in the transaction of his business. This he may do in person or through his employees. The word employees should receive a liberal but reasonable interpretation; so interpreted, it does not mean that such instruments and wires are subject to the free use of the general public."

QUERIES

DETERMINING RESISTANCE OF VOLTMETER BY ITS OWN READINGS.—(843.)

In measuring resistance with a voltmeter, I have had given me a formula in which the resistance of the voltmeter is taken into consideration. As the voltmeter in my possession is not marked to show the resistance of its windings I would be grateful if you will inform me of some method whereby I might ascertain its resistance. P. H.

To secure the resistance of your voltmeter without the use of any other testing instrument, all that is necessary is to take a reading with the voltmeter on some power source with a constant voltage and introduce known resistances in series with the voltmeter until the needle shows exactly one-half of the first reading. The sum of the known resistances will equal the resistance of the voltmeter.

REPAIRING CONDENSERS.—(844.)

We have recently had a number of our 2 M. F. condensers punctured by lightning. Will you kindly inform us if there is some way in which we can repair these condensers without returning them to the manufacturer. We have unrolled a few but experience difficulty in again getting them into their cans. Anything you may be able to tell us will be greatly appreciated. A. S., Kansas.

There is not much doubt but that you experienced difficulty in getting the condensers again in the cans after having been unrolled, when one considers that in their manufacture they are placed under a pressure of from fifteen to thirty tons after rolling and boiling in paraffin. Further, you would discover if you were to test that your condensers were of a greatly different capacity after the unrolling. The method frequently employed to repair a punctured condenser is to send a current of high voltage through it for a very short time. Touch the terminals of a 110 volt circuit to the condenser terminals for about a second and unless the "short" in the condenser be unusually heavy the trouble will disappear. This is due to the fact that the tinfoil extending through the puncture is usually not much larger than a pin point and the heavy current applied momentarily will burn it away, owing to its high resistance. Another way in which condensers are sometimes repaired is to heat the entire condenser gradually until it is just about as hot as you can handle it. This often causes the paraffin to run and fill up the puncture. Caution must be used, however, in the heating, as the paraffin will, if it becomes too hot, explode.

CHANGING SWITCHBOARD FOR SELECTIVE RINGING.—(845.)

We have a Stromberg-Carlson C. E. common return system, which we wish to change to two party selective ringing. We are using a Warner pole changer, and hand generators for ringing.

Will you please give diagram of ringing apparatus whereby we can ring two party selective without sending in all the ringers of the telephones we now have to have them changed. C. L., Iowa.

We presume that the switchboard you have is the one using the circuit substantially shown in diagram *B*, Fig. 845. To change the board for selective ringing you will only have to install a master ringing key, wired as shown in diagram *A*, Fig. 845. In the line circuit you will have to insert a 100 ohm impedance coil as shown at *I* in the diagram. As all lines on a board of this type are connected in common to one bus bar it is necessary to add this coil in each line in order to eliminate a dead ground on the line. After the impedance coils are wired in it will be possible to ring a bell connected to ground. With this circuit, as modified, an additional 100 ohms will be connected in series with the supervisory lamp in the cord circuit when a connection is up, and the lamp will not burn quite as brightly as before. Still, it will be bright enough for good supervision.

WIRES RUN IN IRON PIPE.—(846.)

Our wires on one lead go through an iron pipe under the railroad tracks and we have trouble with them on account of the moisture getting in the pipe and grounding the lines. How can this be avoided permanently?

It would be well to pour into the pipe, after the wires are in, as much melted paraffin as it will hold and then tape the ends well with a layer of rubber tape, and over that a layer of regular friction tape.

The melted paraffin will fill up all of the open spaces in the pipe and obviate the possibility of a condensation of moisture in the air in the pipe causing water to affect the insulation, making a partial ground.

IN THE OPERATING FIELD

BELL COMPANY RAISES RATES IN CHATTANOOGA, TENN.

THE East Tennessee Telephone Company, a subsidiary branch of the Cumberland Telephone Company, has created a row in Chattanooga by announcing that rates will be increased in that city on May 1. The commercial interests and the city council have protested against the advance, but the order to increase the rates is still in effect.

PROPOSED NEW JERSEY LEGISLATION CONTRARY TO THE INTERESTS OF TELEPHONE COMPANIES AND THE PUBLIC.

NEW JERSEY is at the present time very much aroused over the questions of telephone rates and operating conditions. The Hon. Wm. J. Wood, of Elizabeth, is seeking information which will enable him to improve existing conditions, and the following correspondence between him and Mr. Henry Shafer, of Chicago, contains matter of general interest.

Henry Shafer, Esq.,
Prest. International Tel. Mfg. Co.,
Chicago, Ill.

Dear Sir:

"I have read with interest your letters to Sir Wm. Mulock as they appear as exhibits in 'Appendix A' to report of Canadian Select Committee on Telephone Systems.

"I am having introduced into the State Legislature here a bill establishing maximum rates for New Jersey. These rates run from $50 per year throughout the State for unlimited service on a single party wire to twenty dollars ($20) per annum for the same service on a four party wire. In your opinion are these rates too low?

"I wish that I could obtain a more complete list of telephonic rates and charges than that which appears on the 20th page of the volume just referred to, so that I could prepare my argument and be in readiness to meet all assaults made on the bill. The Telephone Trust has a monopoly in this territory and their general conduct is dictatorial, domineering, arbitrary and insulting, while their charges would reasonably justify an indictment for extortion.

"If there is anything that you can offer to assist me, it will be gratefully received. What I most desire is statistical information showing that my rates are not confiscatory; if you can give this, or suggest any way in which it may be obtained, it will prove of inestimable value. I might add as a guide to any suggestions as to rates that we have no city in this state of over 300,000 population."

Thanking you for your courtesy, I am, respectfully yours,

(Signed) W. J. Wood.

To this letter Mr. Shafer made the following reply:

Hon. Wm. J. Wood,
208 Broad street,
Elizabeth, N. J.

Dear Sir:

"Replying to your valued favor of the 6th inst., in which you state that you are having introduced in the New Jersey Legislature a bill establishing maximum rates for telephone service, you will pardon us for suggesting that we believe legislation in a different form would secure the best possible telephone service at the most reasonable charges to subscribers much more readily than by absolutely fixing the rate.

"If the State fixes a rate at which service is to be given it should insure the investor in the exchange a maximum charge at which labor can be secured during the life of the franchise and a maximum price of material going into the construction and maintenance of an exchange.

"It must be realized, when considering matters of this kind, that at the present prices of copper, brass, German silver, platinum, everything going into the construction of a telephone plant costs approximately twice as much as it did a number of years ago. Even the interest rate on capital, at the present time, is higher.

"Practically all supply houses for all classes of material at this time have a notation on their invoices that the prices are 'subject to change without notice,' and all changes for the past year or more have been an advance over previous quotations, and from present indications there is no tendency toward a reduction in prices of such material.

"We believe that the most satisfactory method of obtaining the results you desire is by open competition and to direct State legislation toward making competition in your State more open. That is, when a company is organized with a charter from your State, to operate telephone exchanges, and is desirous of making the investment and installing a telephone system, depending on the public for securing their patronage against an existing company that has the advantage of already having a large list of subscribers—that the new company should be allowed to build its system in any city in your State, and the local municipal authorities, when adverse, having no more power than police jurisdiction.

"You will agree with us that real competition in any line gives to the consumer or user the very highest class of product which money and skill can devise at the least possible cost under existing conditions.

"This principle has been demonstrated in the telephone line in many of our larger cities as well as the small towns. In the larger cities, where two companies are operating under competition, it has not only greatly increased the number of telephone users, but has caused the large business houses who feel obliged to reach all of their customers to have a line to both exchanges, and have so increased their telephone patronage by reason of competition that if all of the telephone users were connected with one system, such business houses would require the same number of trunk lines to the one exchange to meet their requirements.

"Taking into consideration the increased number of telephone subscribers, having two systems does not increase the number of instruments necessary to the large business houses and in this manner work a hardship, but, on the contrary, it has a tendency to reduce the rental to the lowest rate possible and increase the efficiency of the service to the highest standard obtainable.

"For the reasons above mentioned, you will pardon us for stating we believe that the legislation you have in contemplation will check the development of the business, have a tendency to prevent competition under existing uncertain conditions with reference to the future cost of material and labor, and also have a tendency to make, if possible, the present telephone trust even more dictatorial, domineering, arbitrary and insulting—and we believe you can only obtain the desired results by passing legislation so that if the right to establish a public service exchange cannot be secured of the local municipalities this right may be obtained from the courts or by reason of the company's State charter."

Yours very truly,

(Signed) Henry Shafer.

VIRGINIA INDEPENDENT TELEPHONE ASSOCIATION TO MEET AT NORFOLK, VA., ON MAY 21, 1907.

THAT the next annual meeting of the Independent telephone men of Virginia shall be held at Norfolk, on May 21, 1907, was determined at the recent meeting of the executive committee of the Virginia State Independent Telephone Association. The members of the executive committee, who are Albert Parlett, Bristol; W. N. McAnge, Suffolk; W. R. Duke, Charles Hesville, C. Fred Bonney, Norfolk, and George B. Keezel, Keezeltown, met at Murphy's Hotel, Richmond, on March 19, and, in addition to fixing the date of the State convention, admitted into the association four new members. As the date fixed for the State meeting is after the opening of the Exposition, the time is especially convenient for many members from the more remote parts of the State. Matters of considerable importance and interest will come up at this meeting, and it is expected that there will be a very full attendance. Any question will be cheerfully answered by B. L. Fisher, secretary of the association, Rocky Mount, Va.

LOUISVILLE BOARD OF TRADE TO SETTLE BELL RATE CONTROVERSY.

A COMMITTEE of five members of the Board of Trade at Louisville, Ky., is to decide what constitutes fair rates for telephone service given by the Cumberland Company in that city, and will name the rates to be charged. J. E. Caldwell, of Nashville, president of the Cumberland Telephone & Telegraph Company, went to Louisville last week to meet with the Board of Trade to discuss the subject. Louisville patrons of the Cumberland company have been complaining loudly of the unjust rates and poor service given there, and requested Mr. Caldwell to come up and talk the matter over. He was asked if he would submit the company's books to the committee to enable them to decide what a just rate would be, and he consented. The following committee now has the matter in hand and will name the rates for Louisville: George Gaulhert, Attilla Cox, W. R. Belknap, Marion Taylor and Logan C. Murray.

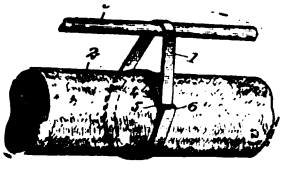
TELEPHONE PATENTS

CABLE HANGER.

Benjamin H. Skinner, Canton, Ohio, patents (No. 844,200, dated February 12, 1907; filed September 11, 1906; serial No. 334,185) a cable hanger.

This device consists of a band of metal 1 of sufficient length to encircle the cable 2 and to again also encircle the cable and the supporting wire 3 when cable and wire are spaced at the desired distance apart. It is attached in the following manner:



One end 4 of the band is placed on one side of the cable and from this point the band extends up over the cable and around through the ring 5, which is secured to end 4, thence up over the supporting wire and down around the cable to the ring where the end 6 of the band is secured by passing through the ring and folded back under the portion of the band adjacent to the ring.

PARTY-LINE LOCK-OUT.

Charles H. Wood, Cleveland, Ohio, patents (No. 840,544, dated January 8, 1907; filed February 17, 1904; serial No. 193,962) and assigns one-fourth to John T. Hobbs, Cleveland, Ohio, a party-line telephone mechanism.

This patent covers a form of step-by-step selective lock-out system, in which the selector is operated by means of relays connected serially on a third line wire extending from the central office through the several stations to a terminal ground.

COMBINED TELEPHONE DESK STAND AND CALL BELL.

Charles A. L'Hommedieu, Buffalo, N. Y., patents (No. 849,250, dated April 2, 1907; filed January 5, 1905; serial No. 239,819) and assigns one-third to William A. L'Hommedieu, New York, N. Y., and one-third to Harry L'Hommedieu, Buffalo, N. Y., a combined telephone desk stand and call bell.

This patent covers a form of desk telephone having a hollow base provided with an opening through which extends the hammer of the ringer movement located in the base; the standard has a screw thread engagement with the base. Immediately above the base the standard is encircled by a gong upon the inner surface of which the hammer of the ringer movement strikes.

TELEPHONE CALL METER.

Charles T. Bradshaw, Philadelphia, Pa., patents (No. 847,461; dated March 19, 1907; filed September 27, 1904; serial No. 226,142) a telephone call meter.

This invention is a modification of the telephone call registering device or meter on which Mr. Bradshaw filed application October 3, 1903, serial No. 175,566, and comprises an attachment for the subscriber's telephone containing a relay actuated by current of a nature different from that required to operate the other portions of the telephone and which is controlled by the central office operator. The operation of this relay causes a movement of cog wheels to which are attached the indicating pointers traveling over a marked dial.

There is also provided means whereby this relay is locked against operation when the telephone receiver is upon its hook, thus insuring that no calls may be registered excepting when the subscriber is using the line.

NON-ARCING MUFFLED FUSE.

Frank B. Cook, Chicago, Ill., patents (No. 843,930; dated Feb. 12, 1907; filed June 12, 1905; serial No. 264,937) a non-arcing muffled fuse.

This patent covers a suitable tube with fuse enclosed therein surrounded by a fluffy asbestos filling to prevent flash and take up the report occasioned by the explosion of the fuse wire.

PARTY-LINE LOCK-OUT SYSTEM.

Clarence A. Anderson, Salina, Kansas, patents (No. 846,381; dated March 5, 1907; filed January 3, 1905; serial No. 239,344) and assigns one-half to John Anderson, Salina, Kansas, a telephone exchange system.

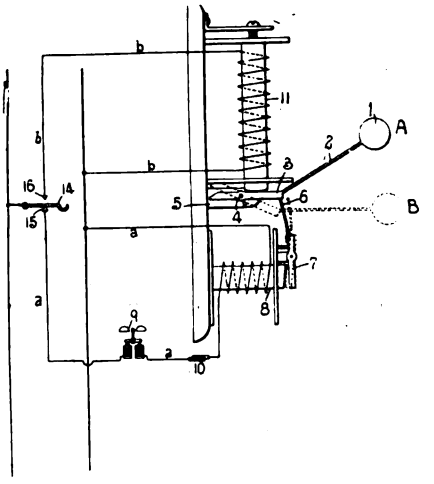
This patent covers a form of step-by-step selective party line lock-out system adapted to magneto call lines, in which are employed a device at the central exchange for selecting the subscriber desired, and a selector in the telephone so arranged as to respond to the impulses of current sent out by the central office selector.

TELEPHONE SIGNAL INDICATOR.

Thomas B. Jordan, Dallas, Texas, patents (No. 838,117; dated Dec. 11, 1906; filed June 15, 1906; serial No. 321,879) and assigns two-thirds to George A. Carden, Dallas, Texas, a telephone signal.

This device consists of a signal operative upon the ringing of a subscriber's station, indicating to the subscriber, when two or more telephones are located in close proximity, the instrument upon which he has been called.

The signal is held in an unoperative position by the retaining spring 6, which being attached to the armature of the coil 8 and being operative with it, will of necessity release when the coil 8 is energized, which would be the case in the event of the ringing current passing through it. The circuit of coil 11 is completed upon the removal of the receiver from the hook and the magnet



being energized by the flow of talking current thru the coil attracts the armature plate to which the signal is attached back to its normal position, upon which the retaining spring 6 falls in place, leaving the indicator ready for the next call.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

NEW DECISIONS ON TELEPHONE PROTECTOR PATENTS.

FRANK B. COOK, 238 West Lake St., Chicago, Ill., announces that a decision has been awarded in his favor in two of the interference suits on self-soldering protectors which have been pending for a long time. The cases came up for final hearing at Washington, D. C., February 18, 1907, and on March 4th Mr. Cook received the decisions.

There were only two claims at issue in each case, and the four claims which are now awarded to Frank B. Cook read as follows:

In an electrical circuit protector, a heat cartridge provided with a central spindle having a solder connection with the cartridge, means for heating and softening said solder connection on the passage of an unduly strong current, and means for placing said spindle in position for resoldering.

In an electrical circuit protector, a heat cartridge provided with a centrally disposed movable member having a solder connection with the cartridge, means for softening said solder on the passage of an unduly strong current to permit movement of said member, and means apart from the heat coil for placing said member in position in which the solder connection can be hardened, fastening the central member.

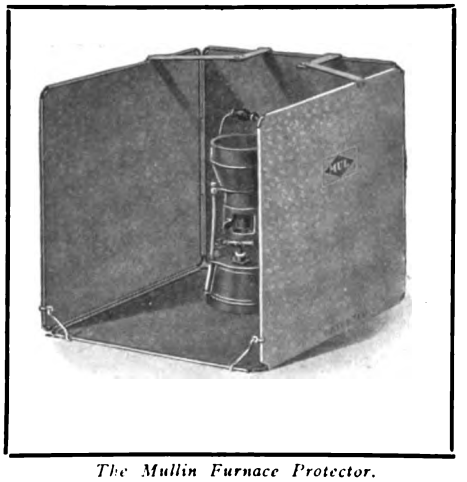
In an electrical circuit protector the combination of an excess current operated device, circuit controlling mechanism co-operating therewith, and means apart from said device for placing the parts thereof in position for another operation.

In an electrical circuit protector, the combination of a self-soldering heat cartridge, means for supporting the same, and means apart from said cartridge for placing the parts thereof in position for resoldering.

These claims, which are only four out of 32, indicate how broad will be the scope of Cook's patents. The above claims, together with others, were especially drawn to cover the Kaisling device, and this fact was stated by Mr. Cook in a circular which he published and sent out April 15th, 1905. The decision which has just been rendered at Washington is absolutely final, so that Cook's self-soldering patents are thoroughly established.

THE MULLIN FURNACE PROTECTOR.

CABLE splicers when using a gasolene furnace set near the mouth of a manhole are accustomed to set up a shield to prevent the wind from beating down the flame and carrying away the heat, in order to get most rapid and efficient effects. An improperly designed shield is, however, more of a nuisance than a benefit. Frequently, it may be observed that on street corners and other places where the wind is strong the workmen will place a heavy weight against the shield, but even this does not always prevent it from toppling over when a passer-by accidentally comes into contact with it. If it does upset, the hot paraffin or solder will be spilled, and if they happen to fall in the manhole, the results are sure to be unpleasant and probably serious. Colman J. Mullin, 438 Kent Ave., Brooklyn, N. Y., has frequently observed these things and has designed a furnace protector which he claims will do away with all such difficulties. As shown in the accompanying illustration, it is provided with straps and hooks which will absolutely prevent the wind or the passer by from accidentally toppling it over. It shields the furnace perfectly from the wind.



The Mullin Furnace Protector.

Mr. Mullin manufactures also a great variety of special devices for underground cable construction, designed by him after a long and thorough practical experience in underground cable work. They have met with the approval of engineers and foremen and are now in use by many of the most important telephone companies. Among his devices may be mentioned Wizard winches, both in steel and wooden frames, mandrel conduit cleaners, sheaves to prevent creasing of lead cable in pulling in, rigid uprights to hold the sheaves in position in the wellhole, the well known "Gem" cable grip and many other devices. Circulars describing all of his specialties will be mailed to any person interested in underground work upon receipt of a request.

THE CENTRAL TELEPHONE & ELECTRIC CO., St. Louis, Mo., have on hand for immediate shipment a considerable quantity of standard size telephone cable, on which they will be pleased to make quotation for spring construction work. The company is able to make especially attractive terms on this cable, which was purchased before the advance in the prices of raw material. There are many other items on which they are in a position to make special quotations, and it will be to the advantage of the telephone buyer this spring to communicate with them promptly. Particular attention is invited by the company to its new pay station sign.

STROMBERG-CARLSON TELEPHONE MFG. COMPANY, Rochester, N. Y., sells rosin core flux solder, put up on 10 lb. spools, in a form which is very convenient for the use of every telephone exchange and shop. A small amount can be taken off the spool and packed away in a lineman's kit. This form of solder has probably a wider use in telephone work than any other, as it does away with the annoyance and disadvantages arising from the use of paste about a switchboard and frames. Full information and prices may be obtained by writing to the company.

THE LEEDS & NORTHRUP CO., 4901 Stenton avenue, Philadelphia, Pa., is sending out an interesting bulletin which calls attention to some of the most important points embodied in its standard resistance sets and Wheatstone Bridges. Upon the first page of this bulletin appears a certificate from the National Bureau of Standards covering the tests made for the verification of a Wheatstone Bridge of the Anthony pattern which was made by the company. The tests show the precision of adjustment obtained by the company, as shown by the fact that there was no resistance in the rheostat having an error of adjustment as great as 1/100 of 1 per cent of its value. This proportion is much higher than that specified in the catalogue and the company states that this improvement over the guaranteed value is commonly attained in its instruments. Statements in regard to the qualification of the instruments which give them permanent accuracy are also given and the various standard types of sets are described and illustrated.

The booklet is one that will prove interesting to every telephone man having to deal with the maintenance of telephone apparatus. It will be mailed free upon request.

BUFFALO, WYO.—The Klondike Telephone Company, whose object it is to construct, maintain and operate telephone lines in Johnson county, has been incorporated with a capital stock of $1,000. The principal office of the company is to be at Buffalo, and the following directors have been elected: J. Elmer Brock, R. O. Watkins and G. E. A. Moeller.

FINANCIAL.

NEW PARIS, IND.—The capital stock of the New Paris Mutual Telephone Company has been increased to $10,000. It is the company's intention to build some extensions and install some new equipment in its exchange.

MONROE, MICH.—The Ida Telephone Company has increased its capital stock from $5,000 to $10,000.

THREE RIVERS, MICH.—At a recent meeting of the Three Rivers Telephone Company it was voted to increase the capital stock from $50,000 to $100,000, in order that extensive improvements might be made in the company's plant.

MANKATO, MINN.—A four per cent semi-annual dividend on the common stock outstanding and a three per cent semi-annual dividend on the preferred stock, payable April 15, has been declared by the Mankato Citizens Telephone Company.

BURLINGTON, O.—The Burlington Telephone Company has increased its capital stock from $300 to $3,000.

M'KINNEY, TEXAS.—The capital stock of the McKinney Telephone Company has been increased from $30,000 to $40,000.

OCONOMOWOC, WIS.—The Badger Telephone Company has filed an amendment increasing its capital stock from $5,000 to $25,000.

FRANCHISES.

HOPE, IND.—At a regular meeting of the Hope town board an ordinance granting a franchise to the Hope Telegraph and Telephone Company was passed.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

FOR TELEPHONE MEN

This Cyclopedia contains more information on electricity and telephony than any other work published. It thoroughly explains all the duties of the manager, lineman, switch-board and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms—undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

Cyclopedia of Applied Electricity

Five large volumes—2,500 pages—2,000 full page plates—size of books 7 x 10 inches—bound in three-quarters red morocco, fully indexed, Diagrams, Descriptions, Formulae, Sections, Tables—supplemented by practical test questions—prepared especially for practical men who have no knowledge of advanced mathematics.

REGULAR PRICE, $30.00 — SPECIAL, 30 DAYS, $19.80

Sent Express Prepaid for 5 Days' Free Examination

Pay $2.00 cash and $2.00 a month thereafter until you have paid $19.80, if you keep the books. We send for them, at our expense, if they do not meet your needs. The only reason this set is offered at such a low price is to acquaint the public with the superior instruction of the American School of Correspondence—these books being partly compiled from the instruction papers.

Partial List of Contents

Telephone Instruments, Telephone Lines, Telephone Exchange, Telephone Operation, Automatic Telephone, Wireless Telephony, Magnetism, Measurements, Wiring, Telegraphy, Direct Current Dynamos and Motors, Electric Lighting, Railway Power and Lighting, Arc Lamp Development, Electrical Construction, Management of Dynamos and Motors, Power Station, Alternating Current Machinery, Power Transmission.

A 200 page handbook describing our course in Telephony and 60 other courses sent free if you mention American Tel. Journal.

Pole Setting Time

and the high prices you have had to pay for Poles surely has impressed you with the necessity of making them last longer.

Avenarius Carbolineum
(Registered)

has been on trial for over 30 years by leading telephone and telegraph companies, Railway companies, the U. S. Government, etc. By simply painting your poles with it, it will more than double their life. It is inexpensive.
Write for prices and literature

Carbolineum Wood Preserving Co.
MILWAUKEE, WIS.

John Wanamaker says: "If there is one enterprise on earth that a 'quitter' should leave severely alone, it is advertising. To make a success of advertising one must be prepared to stick to it like a barnacle on a boat's bottom. He should know before he begins it that he must spend money—lots of it. Somebody must tell him, also, that he cannot hope to reap results commensurate with his expenditure early in the game. Advertising doesn't jerk: it pulls. It begins very gently at first, but the pull is steady. It increases day by day and year by year until it exerts an irresistible power."

EDDYVILLE, IA.—The Mutual Telephone Company has elected Ed. Chapman, president; D. H. Hawthorn, secretary-treasurer; Geo. Ward, B. W. Smith and Joe Kirfman, directors.

ALMA, MICH.—The following officers have been elected by the Union Telephone Company: Tod Kincaid, president, Owosso; J. P. Gibbs, vice president, Ithaca; L. L. Conn, secretary, Alma; treasurer, G. S. Ward, Alma.

SUMMIT CITY, MICH.—The Farmers' Mutual Telephone Company has elected the following officers: President, L. J. Tedman; vice-president, A. J. Higbea; treasurer, John Bowden; secretary, A. E. Pulver.

RAVERSE, MINN.—The following officers and directors have been elected by the Farmers' Co-operative Telephone Company: Andrew Young, president; F. Hahn, vice-president; Louis Yost, treasurer; Frank Osborne, secretary; Paul Guertin, Ed. McMasters and Geo. Wolfe, directors.

MAPLEWOOD, MO.—The Maplewood Telephone Company has elected the following officers: M. D. Norton, president; E. N. Norton, vice-president; J. S. Stephens, treasurer; G. B. Lamm, secretary.

HIGHLAND, N. Y.—At the annual meeting of the stockholders of the Highland Telephone Company Henry Greenfield was elected president; J. H. Hunter, vice-president; B. C. Durland, treasurer, and F. H. Florence, secretary.

LAKE VIEW, N. Y.—The following officers have been elected by the Lake View Telephone Company: President, F. E. Lord; vice-president, William Newstead; secretary, Frank Kane; treasurer, Fred King.

PERSONAL.

FRED CLEAVER has been appointed superintendent of the plant of the Bell telephone company at Dubuque, Ia.

W. B. MOORE has been appointed manager of the exchange of the Cumberland Tel. & Tel. Company at Alexandria, La.

ELDON MOWRER has accepted the position of wire chief at the exchange of the Sandusky Home Telephone Company, Sandusky, O.

NOAH YENRICK has recently resigned his position as manager of the Lancaster Telephone Company, at Lancaster, O., to take charge of the exchange of the Home Telephone Company at San Diego, Cal.

MISCELLANEOUS.

WANATAH, IND.—The Wanatah telephone exchange has been acquired by J. Vene Dorland, president of the LaPorte Telephone Company. Many improvements and extensions in the system are planned by the new owner.

WEST LIBERTY, IOWA.—The West Liberty Telephone Exchange has become the property of M. S. Mellick, he having purchased it from the West Liberty Telephone Company. The purchase price was $12,000.

MURRAY, KY.—The property and franchise of the Independent Telephone Company have been acquired by Dr. Will Mason, whose intention it is to make many improvements in the plant.

WASHINGTON, PA.—The directors of the Farmers' Mutual Telephone Company are J. C. C. Pease, R. L. Munce, R. G. Lutton, S. O. Black, R. B. Blaney, S. N. Hopper, H. A. Bay, W. Coursin, C. M. Linn, H. P. Mollinauer, J. R. McPherson, J. W. Martin, B. K. McConnell, H. H. Bebout and John Fulton.

New Construction in the Field

LEWISTOWN, ILL.—The telephone lines of L. E. Cutler at Abingdon are to be extended to Lewistown.

MONMOUTH, ILL.—New lines from Monmouth to Berwick and Swan Creek are being built by the Independent Telephone Company.

MT. PULASKI, ILL.—Many improvements are being made by the Mt. Pulaski Telephone Company in its system.

ANGOLA, IND.—The Steuben County Electric Telephone Company, which has recently installed a new switchboard, expects to build a new line from Angola to Metz. The line between Fremont and Jamestown is also to be rebuilt, and considerable work is to be done around Crooked Lake and Lake James.

ADAIR, IA.—It is the intention of the Farmers' Mutual Telephone Company to greatly enlarge and improve its exchange at Adair.

KEOSAUQUA, IA.—A new switchboard has been installed by the Farmers' Mutual Telephone Company, of Birmingham, at this place.

ALMA, MICH.—The Union Telephone Company contemplates making extensions and improvements in its plant this year.

CLAYTON, MICH.—New lines are being constructed by the Clayton Telephone Company.

MODDERSVILLE, MICH.—The Citizens' Telephone Company contemplates the erection of a new line from Moddersville to Leota.

HALLOCK, MINN.—It is the intention of the Kittson County Telephone Company to erect a new line west of Hallock.

MANKATO, MINN.—Among the improvements planned by the Mankato Citizens' Telephone Company is a line to Decoria.

MINNEAPOLIS, MINN.—New lines are to be built by Tri-State Telephone Company.

ARTESIA, N. M. Lines have been built by the Penasco Telephone Company to Clouderoft, which gives it connections with El Paso, Alamogordo and other points along the Rock Island road.

NAPOLEON, N. D.—The Napoleon Telephone Company expects to extend its system to Hazelton and Braddock.

GAYSPORT, O.—The lines of the Union Hill Telephone Company have been extended into Morgan county.

WAMSLEY, O.—A line from Wamsley to Mineral Springs is to be constructed by the Blue Creek Telephone Company.

HARRISBURG, PA.—The American Union Telephone Company is planning for the equipment of exchanges at Indiana, New Castle, Lancaster, Hagerstown, Chester and Ridgway. Plans for increasing its long distance and toll facilities have also been considered and approved.

YORK, PA.—The York Telephone Company is planning to construct a long distance line from Pittsburg to Philadelphia, and, to make the extension, it is expected that the company will reorganize and obtain a new charter under the name of the York Telephone & Telegraph Company.

FREDERICK, S. D.—A line from Columbia to Frederick is to be erected by the Groton-Ferney Telephone Company.

YANKTON, S. D.—Additional long distance lines are to be erected by the Yankton Independent Telephone Company.

TEMPLE, TEXAS.—The Independent Telephone Company is overhauling and rebuilding its lines at this city.

ABERDEEN, WASH.—The Independent Telephone Company, of which Edward Finch is president, is soon to commence work on its system at this city, a franchise having been granted some six months ago.

SUNNYSIDE, WASH.—Among the improvements in its system recently made by the Farmers' Independent Telephone Company was the installation of a new switchboard.

MEDICINE HAT, ALB., CAN.—The Alberta government has set aside $200,000 for telephone construction, and will make this city the center of the provincial long distance system. Address Hon. W. H. Cushing, minister of works, Calgary, Alb.

MISSION, B. C., CAN.—Many new lines are to be built by the Mission Rural Telephone Company.

MINIOTA, MAN., CAN.—This municipality has decided to at once construct a rural telephone system with 275 miles of pole line. Address J. L. Thompson, Buclah, Man.

MOOSEJAW, SASK., CAN.—Charles Thomas, manager of the Moosejaw Telephone Company, Moosejaw, Sask., announces that an extension is to be built to Craik.

UNDERGROUND.

CAPE MAY, N. J.—The Cape May council has granted the Eastern Tel. & Tel. Company permission to place its wires underground in Cape May.

BROCKPORT, N. Y.—The Home Telephone Company is placing its wires underground in Brockport.

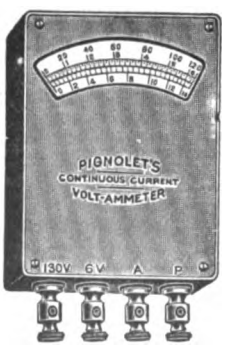
LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.
If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.
Does it pay to be informed? You ought to know.
LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

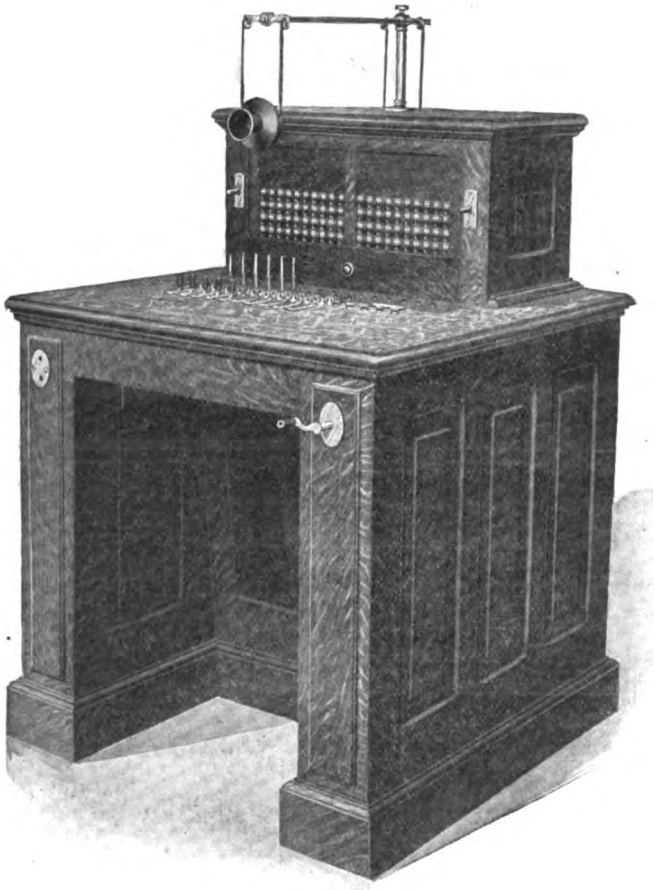
DEAN TELEPHONE APPARATUS

HOW'S YOUR P. B. X. DEPT.?

Dean Private Branch Exchange Apparatus surpasses all others for this class of service.



Our No. 1 Private Branch Exchange Switchboard.

THE REASON

STANDARD DEAN EQUIPMENT, same as used on our large multiple boards.

Dust Proof Relays.

Key shelves five-ply, with grain of wood of alternate layers laid crosswise to prevent warping.

Plug shelf covered with one-eighth inch polished leather to prevent noise in operation and wear on cords and plugs.

Furnished in selected quarter sawed oak or solid mahogany if desired.

All apparatus and wiring easily inspected by removing front and rear panels of cabinet.

Line and supervisory signal pilot lamps provided at each position.

Equipped with the Dean long distance transmitter.

Furnished in any size from the smallest to the largest, and to suit all requirements.

All wiring brought down to a connecting rack contained in the rear of the cabinet.

Standard Dean P. B. X. circuits.

If carefully selected material, good workmanship and proven circuits count for anything in your private branch department, write us.

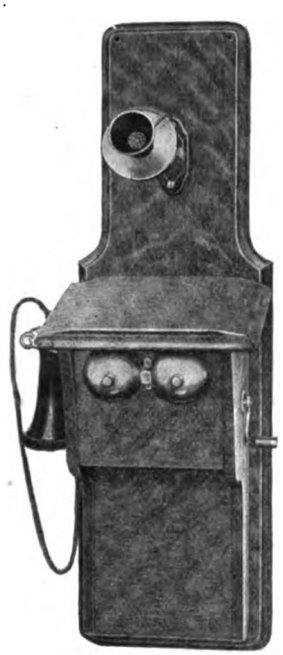
BRIDGING TELEPHONES

"CENTRAL ENERGY STYLE"



CLOSED VIEW.

The "Central Energy" Style Bridging telephone, as illustrated, is furnished with the same equipment as the Compact type Bridging telephone.

The construction of the cabinet is simple and compact, permitting all apparatus, except the ringer, to be mounted on the backboard.

The ringer wiring is soldered to the spring hinges, upon which the cabinet swings, permitting the ringer to be adjusted when cabinet is open.

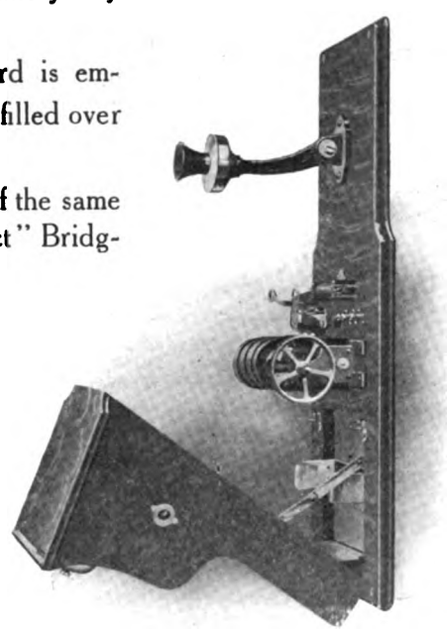
The generator is mounted on two metal strips, enabling immediate removal and rigid mounting.

The line bridging posts are enclosed.

The backboard is cut out to admit two cells of dry battery, which are supported by a galvanized sheet iron battery tray and a spring steel clip.

The wiring through the backboard is embedded below the surface in grooves and filled over with beeswax.

All trimmings and apparatus are of the same quality and forms as used in the "Compact" Bridging Telephones.



OPEN VIEW.

We will furnish standard bridging telephones in this form with four and five bar generators with ringers of either 1000 ohms, 1600 ohms and 2000 ohms.

The "Sure Ring" or "Non-Interfering" devices, or both, furnished if specified.

The simplest, most efficient, "Central Energy Style" Bridging Telephone on the market to-day.

"Stromberg-Carlson" telephones fill every telephone requirement, absolutely irrespective of name, price or form.

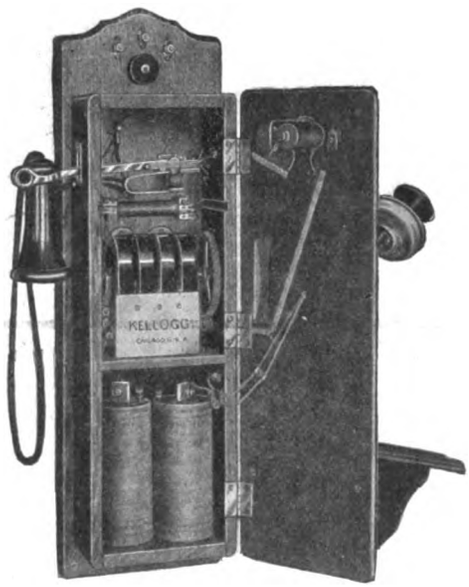
TELEPHONE APPARATUS

KELLOGG COMPACT DRY CELL TYPE TELEPHONES

CONTAIN STANDARD APPARATUS



The accompanying illustration shows our standard compact type Magneto Telephone, a sample of over 100 types. It can be furnished in Oak or Walnut as desired and contains the standard apparatus described in the preceding numbers of this Journal. These sets can be made up to any special equipment ordered. They are becoming very generally used by our customers and are more preferable to the other types of Magneto wall telephones. As can be seen in the illustration, every piece of apparatus is easily accessible, although securely fastened in its place. No part interferes in any way with the working of any other part.

Let our Department A furnish you with our Bulletin and prices on Magneto Apparatus. We solicit your correspondence.

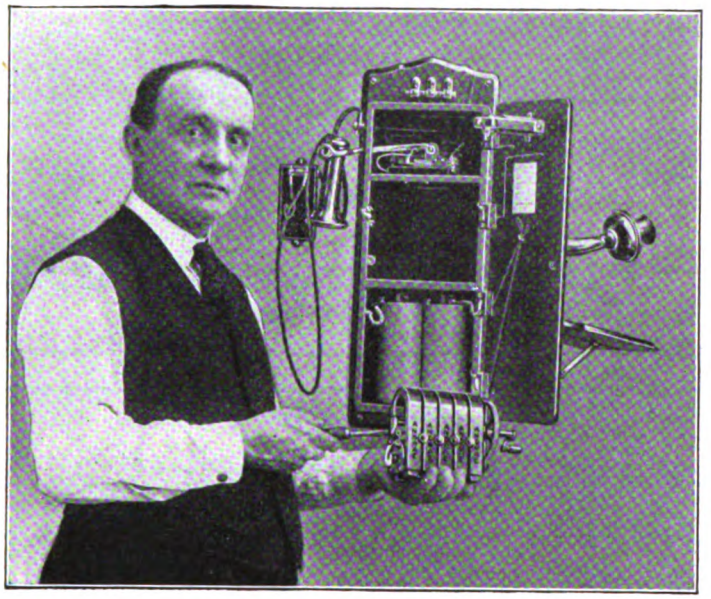
ANDRAE



No Trick At All.

Talks With the Trouble Man

Did you ever examine 10 or 12 generators, each of different make, that have seen 4 or 5 years' service?

At first glance they will look very much alike, but on closer inspection you will discover much difference in their mechanical construction. Some will run perfectly true. Every part will be firmly and substantially in position, and the generator will have a business-like appearance throughout. Others will be weak, wabbly and dilapidated.

Some will show practically no magnetism. This means cheap magnet steel. Others give very feeble current, due to errors in construction, poor contacts on the shunt springs, worn-out insulation or any one of a number of defects.

If one of these instruments happens to be an "ANDRAE," even if it is the oldest in the bunch, you will find it running in perfect condition, giving the same strong, steady-ringing current that it did the day it left the factory. This comes from careful construction, high grade imported steel magnets, positive shunt springs, with perfect connections, good insulation and no sharp corners to cut it; all of the little things that cost money and *cannot therefore be put into cheap telephones.*

I have tested a great many generators, but have not found one that gives the good, honest, rough and tumble wear and tear, long life and power of the "ANDRAE GIANT." All the parts of the Special Heavy Giant Bridging telephones are made on the same scale. You can depend on them to-day, to-morrow, next week, next year and years and years to come.

CONDENSERS

You will notice I still have a condenser attached to my instrument. I told you a little about this last month. If I could not get another, money would not buy this one. You people who are operating party lines without condensers, and wearing your lives out trying to chase up ringing troubles, don't know what you are missing. The sooner you get a few condensers on your party lines the happier you will be. If you are thinking of doing it to-morrow, do it to-day. It costs absolutely nothing to try them. **Prices:** No. 300, 85c. each. No. 301, 90c. each. Lots of 50, 10c. discount. Lots of 100, 15c. discount.

Elevated Railroad Distribution of Telephone Wires in Brooklyn*

By Walter Graham.

TELEPHONE wires are carried to the foot of a support of the elevated structure in cable, which then passes up to a height of about ten feet in an iron pipe which protects it. From the upper end of this pipe the cable is carried across, often loosely suspended, to the cable box, located wherever convenient in the structure which supports the tracks. The open wires, in twisted pairs, are led out from the cable box to a roughly built, box-like wooden conduit, carried along on top of the ties, usually on the side of the railroad. In some places the telephone wires are reported to be less than a foot distant from the third rail, which carries the entire current for operating the heavy trains run over the road. The channel for the telephone wires is, in fact, so close to the third rail that often when the boards forming the cover are carelessly left open they are struck by the contact shoe of the motor car and thrown to the street. In view of the possible risk to pedestrians from such an accident the company has found it necessary to issue stringent instructions to its employees governing the opening of these conduits. Dismissal is threatened any employee caught leaving the covers open. In the illustration on this page the twisted paired wires can be seen as they leave the conduit and are carried across a bridge, pending the completion of some work being done on the railway. A little ahead of the point where the wires leave the conduit can be seen a section of the third rail. It is interesting to note that although there are electric light and signal wires below, the twisted paired wires simply lie on the surface of the structure and that the only insulating agency employed is the covering of the wires.

A Piece of Temporary Work on the Elevated Distributing System—Telephone Wires Led Out of Wooden Conduit at Left and Run Loose Over Bridge.

The terminal box from which these wires are distributed is a wooden double door affair. Access to the box is had by either climbing one of the columns or else by dropping down from the structure. Some times an extension ladder is used from the ground, but owing to the heavy traffic in the streets, which are occupied by electric surface lines, the placing of a ladder is almost an impossibility, and the men prefer to climb instead. Climbing one of these columns is in itself a hazardous undertaking on account of the number of electric light and trolley wires through which it is necessary to pass. There are few guard wires used by the trolley companies under the structure and it is an easy matter for wires to come in contact with them even when care is being exercised in handling the wires. Defective and dead wires are to be seen lying about loose on the girders and suspension wires, and the cables themselves are not protected from the structure by any recognized or approved form of guard.

Occasionally a piece of tape or a bunch of old wires is wound about a lot of wires as they lie on the structure as protection. Resulting from these methods are very heavy maintenance costs.

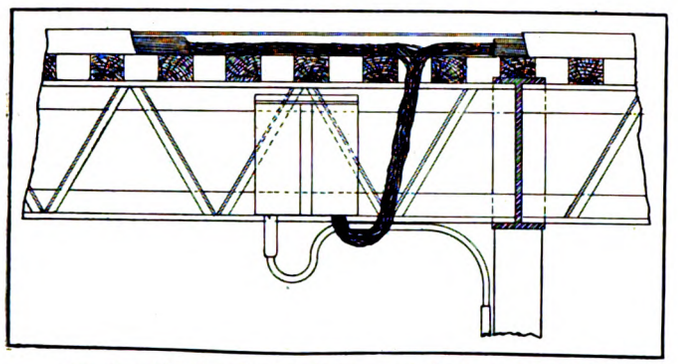
The wire used is mostly No. 14, braided and twisted, rubber covered. Starting from the terminal box the twisted wires run up between the ties and then into the wooden running box or conduit; thence along in the conduit until they come to a point opposite the building they are to serve when they pass out and down under the tracks, along on the wooden ties and break off from a cleat, knob, or hook insulation. Some times not even a cleat is used, in which event the wires simply lie on the girders and jump to the building. An idea of these conditions can be easily obtained by referring to one of the illustrations. In one of these views it can be seen that the wires pass directly above the signalling and

*Continued from the issue of April 13.

Digitized by Google

lighting wires, strung on the cross-arm extending out from the structure. Considering the bulk of wires and the poor manner of supporting them it is marvelous that they manage to keep clear of the other currents as well as they do.

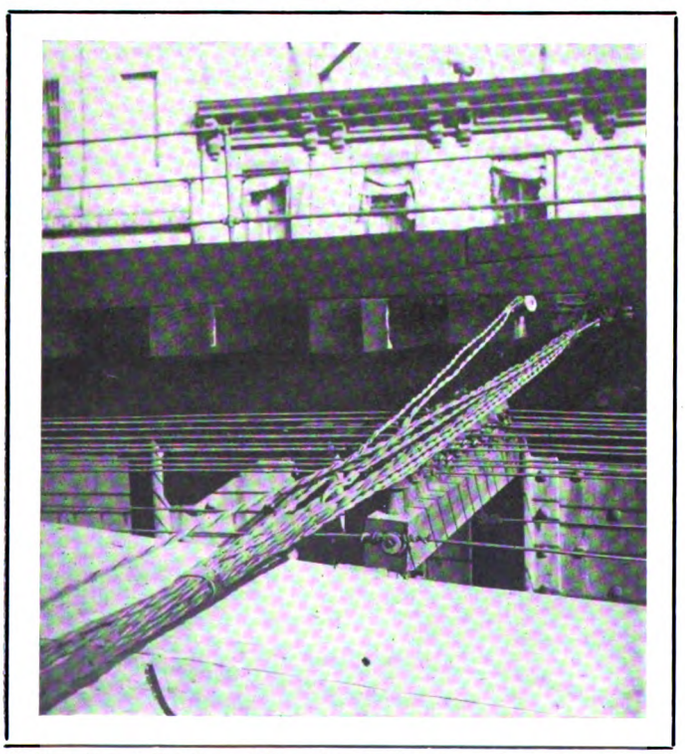
Leaving the elevated structure to trace out a few runs of



Drawing Showing Typical Features of Railway Distribution.

wires, one comes upon other conditions which are in the same class with those on the railway itself. Supports are left out and the wires are allowed to lie unprotected on the roofs of buildings in bunches for two hundred feet or more in a stretch. At street crossings and other points cables and wires make spans from the structure to the roofs of buildings two hundred feet away. These wires sag to within twenty-five feet of the ground crossing above electric light and trolley wires. From the elevated structure loosely fastened bunches of wires jump almost straight up to the roofs of buildings six stories high, without being properly supported by a messenger. Why the wires do not break at the points of support on account of being constantly swayed back and forth by the wind is another marvel that speaks well for the peculiar powers which protect this system.

Whenever a lot of wires follow a brick wall it is noted that numerous small screw eyes are used instead of one ring large enough to accommodate the entire bunch. This is explained by the fact that the screw eye used is closed up entirely, and does not permit the wireman to replace it with a larger one without cutting the wires. Rather than to cut the wires and splice them up again he simply inserts another screw eye into the run to care for the additional line. The illustration showing the wires run along the brick wall brings out the features of such a run



Twisted Paired Telephone Wires Brought Out from Conduit on Elevated Railway Structure and Run Loosely Across Roof of Temporary Building.

that tell the tale better than words. The whole system is a most interesting illustration of the fact that work which is assumed to have a temporary quality may very easily degenerate into a trouble nest. It is very strongly contrasted with modern methods of distribution, some of which may be observed in the outskirts of the very same city of Brooklyn where the lessons of danger and expense, learned from the old elevated system, laid out in the early days of telephony and not yet replaced, have been kept in mind.

Method of Carrying the Same Wires Shown in First Illustration on This Page to Local Terminals.

MANY KENTUCKY TELEPHONE MEN MEET AT PADUCAH.

MEN in all walks of life, as well as men making a specialty of the telephone business, were present at the meeting held March 29th at Paducah of the Kentucky Independent Association. Thirty-four counties, constituting what is known as District No. 4, of Western Kentucky, were represented.

The meeting was called to order promptly by President Frank G. Hoge and after the usual business had been completed Mr. H. J. Jeffrey, manager of the Paducah Home Telephone Company, gave a very interesting talk on Telephone Equipment and Standardizing Toll Apparatus. He also gave a very complete report of McCracken, Marshall and Calloway Counties. His report was a pleasant surprise to all present, inasmuch as it showed an increase of almost 50 per cent. since the last meeting.

Mr. J. F. Nichols, a prominent lawyer from Bardwell, gave an interesting talk on Financing Independent Local Exchanges and the importance of all Independent companies working together. He emphasized the desirability of taking advantage of every opportunity to have the public realize the necessity of supporting the Independent companies.

Mr. J. E. Bridgewater of Bardwell, local attorney of the Illinois Central Railroad, made a very spicy talk on general principles pertaining to the Independent movement and the great success that all Independent companies have made through this section.

Mr. A. W. Surrell, Traffic Manager of the Central Home Telephone Company, Louisville, Ky., spoke on the subject of Long Distance Service and Connection. He went over the plans which the Long Distance Company is making for furnishing the various Independent companies through this section with an up-to-date long distance system, and insisted on the importance of all local managers not attempting to give free exchange of

(*Continued on Page 261.*)

Hints on the Handling of Long Distance Traffic*

By R. A. Walker.

FEW Independents realize that in their toll business they have as truly a commodity to sell as any tradesman or manufacturer. The use of a telephone is largely a matter of habit, a habit formed by education to its usefulness. It then remains for the Independent manager to educate the people to the general use of the Independent long distance lines and enter into competition with the United States mails. There are several methods of creating a demand for long distance service, but it is quite necessary to first have the necessary lines to carry the business after it has been created and also that they shall be efficient in operation.

The mere fact that satisfactory service can be had over Independent lines is hardly known to 25 per cent of the people. It is necessary to overcome this view, either by legitimate advertising in newspapers, through circulars and such other methods as may commend themselves, or by personal solicitation. In the detail of answering subscribers, let the word "toll" be abandoned and following the State Agent, Mr. Hollis, talk about "Long Distance." Carry the thoughts of the prospective user from the fact of the cost to the reality of the service.

R. A. Walker, Manager, Mutual Telephone Co., Des Moines, Iowa.

An actual desire to talk can be created in the human mind by proper incentive. It then remains but to convince the subject that you possess the means of transporting his thoughts. There is a fascination about long distance talking that will grow, and having produced the incentive to talk, the means must be ready of access. The accomplishment of the desire to talk must be as easy and satisfactory as possible.

The actual information necessary for the recording of the message should be taken with as little friction as possible and every effort must be exerted to assure the subscriber that the message is in good hands and will be properly taken care of.

Instruct operators to hold a party on the wire as short a time as possible, and release the calling party until the called party has been secured. A person who is listening to the efforts of the operator to get through is sure to think that he could improve the method, and reduce the necessary information. The full information must be secured before the talks begins, as the things that are to be done after a while very seldom materialize.

While the talk is on be sure there is no interruption, as one small interruption will destroy all the virtue of an otherwise good talk in the mind of the user.

Let us create in all our offices the habit of dispatch. We are, as a whole, slow on the receiving end; we have too much of the idea that the message doesn't amount to anything to us. Get over it! Instruct your operating force to rush calls through and expect that, "as you do unto others, you will be done by." All of these little details go to make the perfect service.

All know that there are periods in some days when great trouble is experienced in handling the business, while at other periods of the day the number of calls could be greatly increased. How to keep all available lines busy without congesting traffic is one of the big problems with which one must deal. It is often found that a street in a city is congested at certain hours of the day, to such an extent that it is of little or no use; just so it is necessary to see that telephonic roads are kept free from any such congestion, and to direct the flow of business from the more busy hours to the less busy ones of the day. This may be accomplished in several ways, and primarily by educating the heavy users to this fact, eliminating deadhead calls, etc. Heavy day loads are often relieved and transferred to night loads by the use of a night rate, which may or may not be a wise expedient.

In smaller stations, probably the need of this is not felt on local wires, but it will be noticed that at certain hours of the day it is almost impossible to secure the "through" wires. This difficulty may again be relieved by duplexing present circuits and using the telegraph for order circuits, by keeping each call ready for the wire at the termination of its predecessor, and not waiting for the clear wire before getting the second talk ready. This point depends largely on the personnel of the operating force and its discipline. The operators must be carefully taught to use code words, and cut all use of toll lines for which payment is not made by subscribers to a minimum.

A reduction in the stress of the busy periods may be made also by the more rigid enforcement of the time limit, of reducing from the five to the three minute limit, during these periods, and again by teaching heavy toll users to bunch their calls for the slack periods of the day. Much time is saved for them by allowing them to talk to their parties one after the other, with the second party right on the wire as soon as the conversation with the first is finished. In this way the man can marshal his facts better and retain the wire a shorter length of time per talk. It will always be found that when calls are held any length of time that the average talk, by actual calculagraph test, is longer, tending toward an additional retardation in the speed of calls.

If the Independent companies are to carry the bulk of the telephone messages of the business world they must have their wires clear for conversations at all hours of the day. As for the operators, it is to be borne in mind, that "A soft answer" not only "turneth away wrath" but also makes a contented subscriber.

*Abstract from an address delivered at the Iowa convention.

Standardization of Toll Line Equipment*

By W. J. Stanton.

THE words "standardization of toll line equipment" are at first associated in the mind with ideas of telephones and switchboards, all built after a uniform design, with similar parts of various makes interchangeable. A second thought, however, gives a broader vision. Toll line equipment has a broader meaning than switchboards, circuits and telephones. It includes all the physical accessories necessary for carrying toll business.

*Abstract from an address delivered at the Iowa convention.

A short time ago a very significant interview took place between the general manager of the Chicago Telephone Company and a number of Chicago aldermen. Mr. Hibbard was defending the Chicago Telephone Company's right to a monopoly of the telephone business in the City of Chicago. His principal argument was that the Chicago Telephone Company was the only company qualified to give efficient *long distance* service. Why? Because it was affiliated with the A., T. & T. Co. And why

Digitized by Google

could not other companies compete with the A., T. & T. Company for long distance business? Because the A., T. & T. Company was able, because of its monopolistic power, to control its terminals and by means of "standardizing" its equipment to "harmonize" its service. His answer was pregnant with meaning. Every clause could be made the subject for a text book. Standardization was the means, "Harmonization" was the end, and Monopoly the agent.

W. J. Stanton, Waterloo, Iowa.

King George scoffed at the thought of harmony among the colonies, just as the "Dictator" in Boston scoffs at the possibility of harmony among Independent telephone companies; but history has demonstrated the fact that the path of progress lies in the direction of Harmony without a Dictator.

Toll Line Equipment, naturally falls under six distinct divisions:

Central Office Equipment.
Station Equipment.
Line Equipment.
Accounting Equipment.
Advertising Equipment.

Miscellaneous Equipment is necessary for the efficient organization of various companies for the purpose of handling inter-company affairs.

As it would be utterly impossible under the limitations of this paper to enter into the details of each of these topics, the aim will be rather to impress upon the minds of its readers the importance of further discussion and careful consideration of the problems set forth.

Early in the history of railroad engineering it was found necessary to standardize along a few fundamental lines. For instance, the tracks must all be of the same gauge, the trucks of the same height, the couplers so constructed that all kinds of cars can be coupled together. In the same general way must telephone men standardize switchboard and station apparatus. Absolute standardization of this apparatus would do for telephony what Buddhism did for China. However, such fixed principles should be laid down as a basis for construction of toll line, switchboard, and station apparatus, governing circuits, and mechanical accessories, including the quality of the material entering into the construction of such equipment, as would preclude the possibility of "Cheap John" apparatus being palmed off upon the unskilled purchaser, and thus destroying the efficiency of a service which otherwise might be excellent. It is true that leaks due to low resistance coils bridged across a line at terminal points cause a far greater loss of talking efficiency than the actual resistance or capacity of the line. The writer has found that at least seventy-five per cent. of the chronic cases of toll line trouble at the stations belonging to and connecting with several of the largest toll line companies in the State have been caused by circuit trouble that could be easily avoided by following a standard set of circuit specifications.

The standardization of line equipment is easier of accomplishment from the standpoint of the engineer. It is absolutely essential at the present stage of development. During the Russian-Japanese war the Trans-Siberian railway service failed because of one weak point, causing untold disasters at the front. Just so a toll line is no stronger than its weakest point.

Standard construction is necessary before there can be any just apportionment of profits between connecting companies. At this time, when the Independent companies throughout the State are combining to build toll lines and heavy trunk lines for carrying long distance business, it is especially necessary that they immediately confer and agree upon a set of standard specifications, and thus avoid the injustice and the almost endless trouble and controversy sure to result unless standard construction is employed by the different companies who are parties to long distance traffic arrangements.

The following incident will show what can be done in the way of standardizing central office and sub-station construction: The superintendent of a company controlling a number of long distance lines and exchanges recently had occasion to inquire of one of his station agents why a certain extensive user of long distance lines did not give the Independent company more of its long distance business. The agent replied that he could not give first-class service to the stations most used by his patrons, and consequently the business went to a competing company. Thereupon the superintendent immediately required the local agent to furnish him a list of the parties called by the patron, and at once notified the agents at those stations to place the lines of the particular parties wanted in first-class condition, soldering all connections, and giving the lines and instruments a thorough overhauling. He also instituted a careful inspection of the office equipment and all defective circuits and equipment were re-arranged or replaced. The results were all out of proportion to the effort.

Stations whose agents or managers had been for months complaining of poor lines suddenly found that the old and supposedly worthless circuits were giving a fair grade of service. The business at the station referred to was nearly doubled. Letters to connecting companies, in some cases, met with prompt and cordial response; in others, a curt denial of any existing trouble at that station. Where co-operation, and to a certain extent standardization was secured, excellent, and in some cases surprising, results were obtained, bringing about great benefit to all concerned. Where co-operation was refused, the same old story continued, and the local companies are still "roasting" the long distance company and its lines, while that company is giving excellent service to all but the "kicker."

Here is lack of harmony, due in the first place to a lack of standardization; and secondly, a lack of standardization, due to a lack of harmony. And here, too, is a loss of thousands of dollars annually to the companies which do not appreciate the existence of such a condition in their own plants.

Standard accounting has already received considerable attention, and the result is the Clearing House. There remains but one other subject—standard advertising. There are but two "systems"—the Independent and the Bell. Systematic advertising pays. If you doubt it just follow the policy and the result obtained by our competitors.

Iowa has the name of being the foremost State in the Union in its wonderful telephone development; yet she sees her sister States, Missouri, Illinois, Indiana and Ohio, taking the lead in an effort to standardize and harmonize. Thus far only the surface has been scratched, but there have been revealed traces of hitherto unthought of sources of wealth. Present properties may be increased in usefulness and consequent value, and undeveloped resources may be uncovered by a concerted effort in this direction. It is the writer's firm

Digitized by Google

belief that all companies interested in Independent long distance business would receive large returns on their investment by referring these questions to competent and energetic men, with instructions to work out the details.

Rural Party Line Ringing Codes*

AN objection to the code published on page 190 of the March 23d issue is made by F. E. Furry, Alden, Ia., in the following letter: "It seems to me that this code is so intricate that it deserves criticism, more particularly so as the author invites a reply. It imposes an immense mental tax on the operator, who has to remember so many arbitrary calls, none of which bears any relation to another. A code which we have used successfully for many years is made up of the combinations of rings shown in table 1.

"In this code the only purely arbitrary rings are 6 and 7. It will cover as many as twenty telephones on a line without confusion by combinations of figures, as 26, two short, one long; 37, three short, two long, etc. For calling the central office we use 62, one short and two long. Party lines are numbered to

1 ·	3 · · ·	5 · · · · ·	7 — —
2 · ·	4 · · · ·	6 —	

Table 1.

correspond to the drops, and the numbers in the directory are listed as follows: Hoffman, Sylvester, 113 r 72. The subscriber repeats this one thirteen ring seventy-two.

"We seldom use more than two figures, although 161 and 616 are exceptions. A single ring is used for clearing out. We use no spaced calls. Double numbers, as 11, 22, etc., are, of course, avoided."

A code designed by Major F. P. Kinder, Collinsville, Ill., and now in use at the exchange at Vandalia, Ill., where it was first put in operation, is shown in Table 2. Figures in the units and tens positions are for the line number, and those in the hundreds and thousands position for the ring numbers. The example in the table is for line No. 9.

F. W. Swift, manager of the Alden Telephone Co., Alden, N. Y., contributes a code used on a 100-drop two-way selective board.

Numbers to be rung selectively by pulling the key toward the operator are denoted by a single number, separated from the line number by a dot, as 10.2. Numbers to be rung by throwing the key back are indicated by the ring number following the figure 1 after the dot, as 10.12. All rings up to 6 are short rings. Above this a cipher, denoting a long ring, is interposed. Thus 32.01 denotes one long, one short ring, with the key pulled

Table 2.

toward the operator on line 32. The long ring is preferably given first as a better warning to the subscriber, in order that he may count the rings correctly. A person not acquainted with subscribers nor their calls could very easily operate a board with this system.

The Corning Telephone Company, Corning, Ia., uses a code, designed by the president, John A. Anderson, very much like that contributed by Mr. Furry. The only difference is that 6 is rung with six short rings, and seven with one long ring. Combinations are built up in the same manner as in Mr. Furry's code. This company employs an unusual method of directory listing, the ring number coming first, then the name of subscriber, followed by the line number, as for example: 1771 Dunn, Robert, Line 30.

1 · —	5 — —	9 — — ·	13 · · · —
2 · · —	6 · ·	10 — · —	14 — · · —
3 · · ·	7 — · ·	11 · — ·	
4 — ·	8 · — —	12 — · · ·	

Table 3.

The Dassel & Collinwood Telephone Exchange Company, Dassel, Minn., limits the number of subscribers on a line to fourteen. The code used for ringing on these lines, contributed by W. S. Jones, manager, is shown in Table 3.

One long ring is the call for central. In the directory the ring number is separated from the line number by a dash.

S. E. Clapp, manager of the exchange of the Hawkeye Telephone Company at Adel, Ia., submits the code shown in Table 4, which, although it must be memorized, can be quickly learned by an operator.

1 —	8 — — ·	15 — · — —
2 — —	9 — — · —	16 · —
3 — — —	10 — — — ·	17 · · —
4 — — — —	11 — — · ·	18 · · · —

6 — · ·	13 — · — ·	20 · — ·
7 — · · ·	14 — · · —	21 · — · —

Table 4.

In the directory listings the ring number is separated from the line number by the letter L, as 8 L 36.

From M. L. Golladay, secretary and manager of the Holden Telephone Company, Holden, Mo., comes the following criticism, and also a statement concerning his code:

"Our principal objection to most of those so far published is the fact that they all contemplate a code which has to be memorized, hence new operators, or new subscribers are for a time 'at sea' until the code is learned. On our switchboards, which have combined drops and jacks, all party lines are brought in to contiguous rows at one position. These rural party lines are designated, not by numbers, but by letters on the jack number plates, and stamped or painted in white on the drops. We start in with vowels, and then use combinations of letters, choosing such combinations as do not sound too much alike. When we run out of letters, as we do on some boards, we use prefixes, like south, east, west, red, black, green, etc.*

"Ring numbers are made up simply of combinations of the figures 1 and 2; all that has to be memorized is that 1 means a short ring and 2 a long ring.

"This makes the work very simple as when an operator receives a call for A 21 all she has to do is to plug in on the jack below drop lettered A, ring one long and one short, and the trick is turned. Combinations for parties up to 20 on a single line can be readily made up without involving too much ringing."

The Whitewater Telephone Company uses combinations of figures for its ringing code. It is necessary to remember the significance of five figures to translate all these combinations

* Continued from previous issues.

*Editor's Note.—Why not paint the ring number with red or green paint on the drop, instead of white, rather than use the word Red, Green, etc.?

Digitized by Google

into rings. The figures used are 2, 4, 1, 3, 5, and 6. The rings corresponding to these numbers are as follows: 1, -; 2, —; 3, - -; 4, — —; 5, - —; 6, — -. The company operates several switchboards, Elbing, Kechi, McLain, etc., and the initial of the proper name is prefixed to the number to denote the switchboard to which the line is connected, only one directory being printed. The last two figures in each number indicate the ring, the others the line. For example, E 7251 in the directory means ring one short, one long, one short, on line 72, Elbing switchboard. All necessary information is printed in the directory. This information is furnished by J. D. Joseph, secretary of the company.

Roy C. Hall, manager of the Ellis Telephone Co., Ellis, Kas., writes as follows:

"We began with our country lines by giving the first line the number 300 (allowing all numbers below this for town subscribers), leaving out the number 301 and numbering the telephones on the line from 302 to as many as there were instruments on this line. The next line built was given the number 350, and we began to number the telephones on this line with 352 and continued the numbering. A code of rings was made up as shown in Table 5.

302 ss	313 sssLs
303 sss	314 sLss
304 ssss	315 ssLss
305 Ls	316 sssLss
306 Lss	317 sLsss
307 Lsss	318 ssLsss
308 sL	319 LsL
309 ssL	320 LssL
310 sssL	321 LsssL
311 sLs	322 LsLs
312 ssLs	323 LsLss

The subscriber's name appearing on the directory:

305	Smith, John,	Ls
355	Smith, James	Ls
405	Jones, James,	Ls
455	Jones, Charles	Ls

Table 5.

"The arrangement of the directory with the 's' and 'L' following the name gives the parties on the same line the proper code by which to call those on their own line and all the operator in the office has to commit to memory is the simple code—the number as called for giving the cue to the line and the code ring. Subscribers know and speak of the lines by their number. We do not use the combinations ss and LL as they are confusing.

"Where the number of telephones on a line does not exceed twenty the code is not complicated and with reasonable care mistakes seldom occur."

The experience of C. D. Warner, manager of the Citizens Telephone Company, Watertown, N. Y., is briefly summarized in the following letter:

"The writer has found the following code the simplest for rural line ringing.

"Reserve one ring for Central, use 2, 3, 4 and 5 short rings for their corresponding numbers, then repeat the same rings, preceded by a long ring, say three times the length of the short rings, which means add 10. This would mean that one long and two short rings corresponds to the number 12; one long and three short, 13, and continue this until fifteen is reached, then prefix two long rings and a short for 21. Three long and a short for 31.

"The particular advantage in this code is in printing the directory, when the calls can always be printed in figures, similar to a fire alarm code, thus: 275-14 would indicate drop 275, ring, one long and four short rings. The writer has always found it best to avoid a telegraph code or any rings that could not be designated by figures."

For an express board the Clay Center Telephone Company, Clay Center, Kansas, uses the plan of designating jacks and drops by letters, and ring numbers are made up by combinations of figures 1 and 2 in the manner described by Mr. Golladay.

M. C. Wilson, the company's wire chief, in addition to giving this information, gives combinations which will cover a line having 28 parties, "just exactly sixteen more than the law should allow any manager to put on one line." These combinations are made up to keep the number of rings as low as possible for each party, and appear in the following sequence, numbers involving the least ringing appearing first: 1, 11, 12, 22, 21, 111, 112, 121, 211, 122, 221, 212, 222, 1111, 1112, 1121, 1211, 2111, 1122, 1221, 2211, 2112, 2121, 1212, 1222, 2122, 2221, 2212, 1222, general call, 2222.

(*To Be Continued.*)

Important Lessons in Rural Service*

By Thomas Bromley, Jr

OUR country districts are becoming more thickly populated, and because of this no telephone company has yet built a line where the requirements have not exceeded their expectations. This being the case, most of the companies are up against the proposition of building new and heavier construction before the life of the present construction is half completed.

Many of the more experienced telephone men have found it advisable to make a map of each proposed line, showing the actual and the probable subscribers, and counting upon seventy-five to ninety per cent. of the probable subscribers being actual suscribers before many months have rolled by. Careful estimates of the cost of construction should be made before proceeding to build. Materials should all be on the ground and telephones ready to install before anything is done toward actual work.

Arrangements should be made in the country for board, etc., before construction crews are sent out; the foreman should know just what is going to be done, and how, and, above all, use the best of materials and workmanship—it is economy in the end.

Contracts should be taken which should state distinctly what service is to be given and for how much. Nothing is so unsatisfactory as doing business with the general run of farmers when there is no record of what is required of the subscriber or company.

It is surprising how much easier it is to make collections when the farmer can be shown that the telephone manager knows all about what service he has had, for he is often a procrastinator in paying his telephone bill, and when he is in arrears and has been urged pretty hard to pay up he is liable to come back with a cry of poor or unsatisfactory service.

To show him a record of the condition of his line and telephone has a very quieting effect. It is important that such a record be kept for this purpose, if for no other, although there are many others, like keeping in touch with the work of trouble men.

Some situations make it necessary that the company require the subscribers to build their own poles lines. From experience the writer would suggest that under no circumstances would it be advisable to build without a contract giving the company exclusive possession of these poles upon the placing of its wires upon them, as in many instances the subscriber feels he owns these poles and should be paid for them, should the company wish to take on other neighbors just beyond.

There are few companies who are making the mistake of allowing their subscribers the privilege of free county service, but to those who are, and to those who have a mind to do so, there is just one word to be said: "Don't." In a certain locality this class

QUERIES

RELAY TROUBLE.—(847.)

On our system, which is a Kellogg common battery, four party, harmonic selective, we had a peculiar trouble a few days ago which cleared itself. We are unable to understand the cause of this trouble. The circumstances attending this case are as follows:

A two-party line having two subscribers upon it was reported out of order. Either party on the line could be called from the central office and could talk all right, but was unable to signal the operator with the line signal. The supervisory signals worked all right when this line was connected with another line, but immediately the connections were taken down the subscribers on the line were unable to secure the attention of the operator. The trouble was called to our attention several times, and in each instance we made a test on the line, which showed a ground on the tip side out of the exchange. The subscriber, who is a telephone man, was so insistent, however, that the trouble was not outside, that, in order to convince him, we put the line on test. We then opened the line and tested out, but found that the ground had disappeared. Then upon testing in to the operator we found that the signal came in all right. This struck us as being peculiar. We then closed the line again and called one of the subscribers and requested that an attempt be made to get the central office. This the subscriber did, and was able to secure the operator's attention in the usual manner. We then tested on the line again, and found that the trouble had entirely disappeared. Any information you can give us as to why this trouble should appear and disappear in this manner will be greatly appreciated. B. B., N. Y.

Your trouble was evidently due to the sticking of the subscriber's line relay in the exchange, which stuck in such a manner as to indicate a ground on the line when you tested upon it. However, upon opening the line, and short circuiting it at the exchange to ascertain if the line signal would operate, you caused a greater flow of current to pass through the relay, owing to the smaller amount of resistance in your short circuit than in the resistance of the line, thereby causing the relay to have a greater magnetomotive power to overcome the sticking of the relay armature. This seems to be proven from the fact that after making the test that you did for securing the attention of the operator the line was in perfect condition. We would suggest that you examine this relay, and adjust it so that it will work with the minimum amount of current, in order that the trouble may not occur again.

REVERSED CONNECTIONS ON GROUNDED SWITCHBOARD.—(848.)

In our switchboard, which is a one hundred-line board, we have a peculiar trouble. When line 63 is connected to line 47 the subscribers on these lines cannot talk to each other at all. The operator can talk on either line alone, but it is impossible for her to talk to either one when they are connected together. We thought at first the trouble was in the switchboard keys, but it acts the same on all the cords, so it cannot be there. Will you please tell us what the trouble is? Our system is grounded. B. L. F.

The trouble you are experiencing is in all probability due to the fact that you have connected the wrong side of one of the switchboard line jacks to ground, as shown in Fig. 848*a*. This would leave the circuit all right when the operator is connected to either line, but you will note immediately the operator cuts

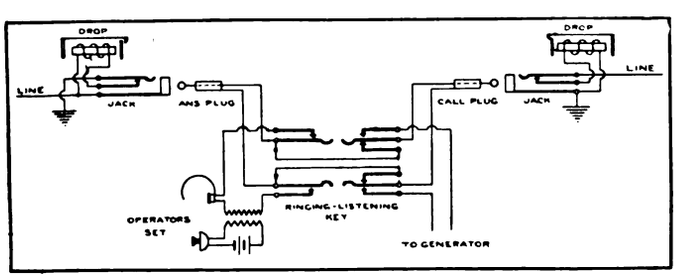

Fig. 848-*a*

out her listening key both sides will be bridged to ground, thus short circuiting the line, and thereby cutting out the subscribers as the sleeve of one jack will be thrown to ground through the sleeve of the other jack and the tip of the second jack will be thrown to ground through the tip of the first, so that each line will be grounded at the jack of the other line.

If you will connect your switchboard with the same sides of all the jacks to ground you will not experience this difficulty.

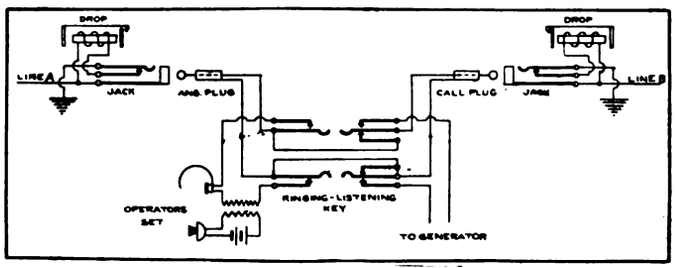

Fig. 848-*b*.

The correct manner of making this connection is shown in Fig. 848*b*. The grounds on the jacks in this circuit do not enter into the talking circuit of the two connected subscribers at all; their circuit being from the ground at instrument on line *A* to the ground at instrument on line *B* onto the line through the sleeve of one jack and the cord to the sleeve of the other jack on to the line and back on the other line to instrument on line *A*.

The ground at the switchboard is provided so that the subscribers may signal the operator and also allow the operator to bridge her talking set on to the line and ground. The set being connected to line through the sleeves and the ground through the tips of the jacks, for the purpose of conversing with the subscribers.

RESISTANCE ON LINE WHEN INSTRUMENTS ARE ADDED.—(849.)

We have a line 18 miles long built of No. 12 iron wire. If we put a bridging telephone in the middle of it, bells 1,600 ohms, induction coils 100 ohms, receiver40 ohms, what resistance do we add to the line and what resistance would two or three bridging telephones add to the line? C. J. W.

In bridging telephones across your line you do not add resistance to the line. What you do is to provide a shunt over which a portion of the current thrown on the line will travel. If you were measuring the line at one end for resistance you would find that the resistance indicated would be less each time you bridged an additional instrument across the line.

The resistance of a line with shunts of this nature is arrived at by dividing the product of the resistances by their sum. By referring to Query No. 816 in the issue of January 19, 1907, of THE AMERICAN TELEPHONE JOURNAL you will find the measurement of shunts worked out in detail on a long line.

STATEMENT OF OHM'S LAW.—(850.)

A telephone man who is an expert on testing lines and cables was recently in our exchange and gave me some information in relation to testing. In his talk he frequently referred to Ohm's law. Will you kindly give me a simple, detailed explanation of what constitutes Ohm's law? R. B.

Ohm's law can be stated simply in the following manner: The strength of the current varies directly as the electro-motive force, and inversely as the (total) resistance of the circuit. Using the units adopted by practical electricians, you can restate Ohm's law in the following manner: The number of amperes of current flowing through a circuit is equal to the number of volts of electro-motive force divided by the number of ohms of resistance in the entire circuit, or the current equals the electro-motive force divided by the resistance.

For simplicity in figuring this relation is expressed by the formula $C = \frac{E}{R}$, C being the amount of current, E the voltage, and R the resistance in ohms in the circuit in question.

THE EDITOR'S PAGE

DUST AND CENTRAL OFFICE DEPRECIATION.

THE rate of depreciation of central office apparatus is a subject frequently discussed by telephone men when they get together. Perhaps too much time is spent in trying to arrive at conclusions on the assumption that this rate of depreciation is a fixed quantity, which can be discovered by combining experiences, and set down in the books and always reckoned upon in the future. This, however, is hardly true. Depreciation in value progresses more or less rapidly in accordance with the amount of care bestowed upon the apparatus, in keeping moving parts well adjusted, and protecting them from all sorts of damaging influences. One of the most important of the minor things against which switchboard apparatus should be protected is the gathering of a dust deposit upon various parts.

In large exchanges the most careful precautions are taken to keep the amount of dust to a minimum. Heating and ventilating systems are so designed that all air which reaches operating and terminal rooms passes through canvas, or some other straining device, which retains all dust particles, allowing only clear, filtered air to pass to the parts of the building where it may come in contact with the equipment. In these buildings reliance for ventilation is placed entirely on the ventilating system, and windows are not opened to let in the dust of the street and smoke from the thousands of city chimneys. Even when such care is used it has been found that much dust is brought in adhering to the clothing and shoes of employees, and this is removed at frequent intervals. Floors, switchboards, etc., have to be cleaned at frequent intervals—cleaned carefully, so that the dust will be removed, and not simply stirred up, to pass from one place to another where it will be perhaps even more harmful.

In small offices such care is generally more conspicuous by its absence than for any other reason. The man owning a hundred line switchboard seems to thing it makes little difference whether it lasts ten years or twenty. Yet the same man is likely to bestow on a watch, having a quarter the value of his telephone equipment, the most painstaking attention.

Dust deposits in jacks, as is well known, are frequent causes of poor contacts, which lead to service complaints, and of actual cutting away of the springs, so that plugs do not fit accurately. We have seen jacks of the cut-off type, carefully made and adjusted, so that little movement of the line springs was necessary to free them from the contact studs, with deep grooves cut in the springs. The result, when a plug was inserted, was a weak and wobbly connection, producing occasional cut-offs, and even failing to disconnect the line drops, owing to the play of line springs being too small to free them from the inner contact studs.

Springs of keys are made to wear more rapidly than they should by similar causes—simply the grinding action of sharp dust or grit between moving parts. The removal of relay caps, and leaving of switchboard curtains open is a practice common in some offices, which should be strongly prohibited, and rules designed to prevent this practice ought to be rigidly enforced. The accumulation of dust in relays especially causes poor contact troubles which affect the service, and cause undue expense on account of the time taken up in clearing them. Even between metallic parts which are not subject to motion a dust deposit is dangerous, as when moistened it lowers insulation, and causes a certain amount of leakage. Many cases of cross-talk and ringing noises on talking circuits have been traced to this simple source.

If every man who wants to keep at the lowest point the depreciation chargeable to the apparatus in his care will simply go over his own experience he will find many things which will point toward the importance of keeping dust out of his central office. These considerations should lead to more adequate precautions in such matters as providing some simple filtering devices at windows which are opened for ventilation, the keeping of overcoats, rubbers, etc., in rooms separate from the operating room, provision of door mats, separation of public offices and pay stations from the operating room, and the like. The results obtained will undoubtedly tend to make it easier to give a high grade of service without annoying breaks, and their cost is paid for in the increased efficiency and longer working life of the apparatus.

THE "TAKE BACK THE INSTRUMENT" IDEA.

"POOR batteries" was the diagnosis of the inefficient trouble man a few years ago when only the magneto instrument was known. Renewal after renewal was frequently made to clear up a trouble which actually existed in some poor contact in the instrument, the line, or even the central office. The inspector would go out, jiggle the hook up and down, listening and looking wise, blow in the transmitter, call central and ask for a long ring, and then say, "Who put in them batteries?" If the subscriber confessed that it was the man with the loud voice who "used to come around" the matter was settled, and the new batteries went in. Then the trouble was repeated, and came in again and again until everyone in the exchange was tired of chasing it.

Now the same kind of a "trouble hunter" goes to even greater lengths. He is unable to charge up his difficulties to poor batteries, in a central energy system, because they are beyond his reach. So the instrument has to bear the brunt of his assault. Down it comes from the wall, and back to the central office. If called upon for an excuse he is ready with the statement that it is cheaper to repair an instrument in the shop than out at the subscriber's station, and if the manager will let this pass he is ready to repeat the offence.

Now, a good many of the instruments so returned have nothing serious the matter with them. Even if there is some fault, it is usually one which could in fact be repaired at the station by a competent man at a lower cost than is involved in carrying the instrument to the central office, repairing it and again carrying it out and putting it in service. Moreover, the whole act produces a bad impression on the subscriber, who is led to believe that telephone apparatus is unreliable and inefficient. If he has ever considered an investment in telephone securities he becomes a bit skeptical as to the value of an investment in such a plant.

Correction has to begin with the trouble man. He needs to have the company's point of view explained, and some system should be devised which will enable the management to follow up all instruments returned from stations. For example, the trouble man might be required to report, before turning in the instrument, the exact nature of repairs required. An understanding as the amount and nature of repairs which justify removal can then readily be established. Further, checks can be made by keeping an accurate account of shop repairs on these particular instruments, and turning the whole report over to a competent official who makes it his business to investigate all cases which show improper conditions.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

PENALTY FOR OBSTRUCTING LINES.

What penalty, if any, is imposed in the State of Arkansas for obstructing a telephone line? What damages can the telephone company collect?

F. J. T.

ANYONE who wilfully or intentionally destroys, injures, or obstructs any telegraph or telephone line or any property or any material used in connection with it, is liable to a fine in the State of Arkansas of not less than two hundred dollars and may be imprisoned not more than one year. The person committing the offense would also be liable for double the damages sustained by the telephone company. This is upon the theory of inflicting an additional penalty for such a willful wrong as that would be, and to deter people as much as possible from interfering with the operation of a telephone line, which is, in a certain sense, a public business. Digest of Statutes, 1904, Section 1899.

RIGHT OF MUNICIPALITY TO PURCHASE TELEPHONE PROPERTY.

There is talk here about the city buying our telephone company if we do not comply with its ideas about extending our service. Our line is now built as far as we have capital to build it, and still pay dividends. We are making a fair earning on the amount involved, and do not wish either to sell out or to make expensive improvements. Would the city have any authority to buy, and could it do so if we were unwilling to sell? Some say that it might.

S. M. R.

THE laws of Minnesota authorize a municipality, at the end of any period greater than five years after the company has received a grant of permission to do business therein, to purchase the telephone property. The value is to be ascertained in the manner provided by law for acquiring property by eminent domain. Before the purchase is authorized, it must be favorably voted upon by two-thirds of the electors at a special election within three months before the end of the five year period. The consideration received is to be applied first to the paying up of mortgages and encumbrances, and the rest to be turned over to the owner of the franchise. As we believe this law has never been tested by actual experiment, we cannot say whether the municipality could force the company to sell, but that is apparently the intention of the law, as evidenced partly by the method of ascertaining the value of the property. This is in accordance with the laws of eminent domain, which are designed to force the sale of property by unwilling owners when public necessity requires it.

CITY RECOVERS PERCENTAGES PROVIDED IN FRANCHISE.

THE Supreme Court of New York has rendered judgment against the Home Telephone Company of Jamestown in that State for the amount of $1,140.08 which is one per cent of the gross earnings of the company during a certain period. When the company was granted its franchise, the following clause was inserted:

"It is also made a condition for the granting of this franchise, and the company by its acceptance, hereby agrees to pay to the city of Jamestown one per centum per annum of its gross earnings at and after the time that the said company shall have in operation 1,000 revenue earning telephones; and whenever said company shall have 2,000 revenue earning telephones, in actual operation, it shall pay to the city of Jamestown two per centum per annum of its gross receipts, and said company waives all right to have said percentage deducted from any taxes according to the provision of the tax law, and agrees to pay such percentage in addition to all taxes."

Presently the time came when the company had more than 1,000 revenue earning telephones in operation and a demand was made by the city for the percentage. This the company refused, taking the position that it did not need any franchise to do business in the city because the transportation law gave it ample power to set its poles and string its wires whether the city wanted it to or not. This contention would undoubtedly have been sustained by the court had it not been that in the charter of the city there was a clause authorizing the council "to prevent and to regulate the setting and stringing of telegraph and telephone poles and wires in said city." This clause the court held gave the city full power to prevent, prohibit, and regulate telephone companies.

REQUIRING PATRONS TO PAY BILLS AT OFFICE IS REASONABLE RULE.

IN the Circuit Court at New Orleans, La., Dr. J. A. McGruder, a dentist, sued the Cumberland Telephone & Telegraph Company with a view to testing the right of the company to require its patrons to call at the office to pay montly accounts. The plaintiff had declined to call at the office to pay his rental, and, after waiting the usual limit of time, the telephone line was plugged out of service, which, the plaintiff believed, entitled him to damages. The telephone company and the plaintiff introduced witnesses to substantiate their respective positions. After hearing the testimony, Judge Bullard gave peremptory instructions for the defendant company, holding that the rule did not seem, from the showing made, to be unreasonable. The plaintiff's attorney excepted to this disposition, and gave notice of appeal, which will throw the case into the Supreme Court.

RISK ASSUMED BY OPERATOR.

AN operator in the employ of a telephone company sued for injuries received while at work in its exchange, alleging that the company had failed to furnish a safe and suitable place for her to work and to maintain its wires and apparatus in proper condition. She testified that on a certain day she received sensations not before noticed, which produced, not a shock, but a "jarring and grinding or rumbling in her ears," which at times caused her head to ache. She also felt her side hurt her, and her arms "kind of tighten," but she did not lose consciousness. For some time prior to the accident the company had been receiving complaints from operators that this switch-board was not working properly and attempts had been made to remedy the difficulty. A verdict directed for the defendent was set aside. The court held that anyone entering the employment of a telephone company as operator at its exchange, assumes the ordinary risks of irritation reasonably connected with the performance of her duties, but does not assume the risks of shocks from an electric current, producing bodily prostration, though the degree of voltage is not sufficiently high to imperil life. The court found it to be the duty of a telephone company to provide and maintain suitable apparatus in its exchange so that the same could be safely operated, and held the case one for a jury to decide. Cahill vs. New England Tel. & Tel. Co., (Mass.), 79 N. E., 821.

IMPORTANT LESSONS IN RURAL SERVICE.

(*Continued from page 256.*)

of service is in effect, and has been for so long that the people have become educated to it to such an extent that they cannot see what use they would have for a telephone if it were not for the county service.

In such a system, it was recently discovered, were over 500 free trunk conversations a day on a system of slightly over 1,600 telephones. That means 150,000 a year of three hundred days, and at ten cents each they would bring in a handsome income. Of course, the ten cents would cut out about sixty to seventy-five per cent. of the connections, and there would then be circuits enough to handle the business without being forever subject to the kicks of the business man who thinks the operator's "line is busy" is simply to keep him from talking. Free county service is an evil, and one of the greatest ones there is in the business.

Speaking again of collections—there is more or less expense attached to enforcing a collection in the country; but great good can be accomplished by following the plan of notifying delinquent subscribers that no connections will be given them from their telephones unless their accounts are paid by a given date. If they do not pay, have the operator inform them that she is instructed by the manager to allow no connections until notified to do so by him. It is well to allow others to talk to them for a time, rather than inconvenience the good-paying subscribers; but if this does not bring them in a reasonable time, there is only one alternative, and every one knows what that is.

In the writer's experience the most important thing to keep in mind is to have no misunderstanding with a subscriber as to what his duty is when you have performed yours. He must be made to understand that it takes money to operate a telephone plant, and that, no matter whether the telephone is used little or much, it has been at his service all the time, and you are entitled to your money promptly and as agreed. Prompt pay puts you in position to give prompt service.

Telephone Legislation in 1907*

WISCONSIN.

SENATE BILL No. 431, introduced by Senator Fairchild, February 12, 1907, and referred to Committee on Judiciary, is an act to amend Subdivision 2? of Action 1039 of the Statutes of 1898, relating to property of telephone companies exempt from taxation.

ASSEMBLY BILL No. 373, introduced by Mr. Kander, February 7, 1907, and referred to Committee on Transportation, is a bill to add to the statutes of 1898 a new section empowering the common council of any city of the first, second, third or fourth class to establish and regulate rates for telephone service.

ASSEMBLY BILL No. 330, introduced by Mr. Domachowski, February 6, 1907, and referred to Committee on Transportation, is a bill relating to the granting of full power of eminent domain to municipal corporations or counties over the property of a telephone company which may impair or inconvenience the use of public streets.

ASSEMBLY BILL No. 205, introduced by Mr. Wehrwein, January 31, 1907, and referred to Committee on Roads and Bridges, is a bill amending section 1329a of statutes of 1898, relating to the placing of poles in public highways. This act describes the distance at which poles should be set from the boundary of the highway, and the minimum height above the ground at crossings. It also relates to tree trimming.

SENATE BILL No. 92, introduced by Senator Froemming, January 31, 1907, and referred to Committee on Transportation, provides that the common council of every city of the first class is authorized to fix rates and regulate the service of telephone companies or other public service corporations.

ASSEMBLY BILL No. 596, introduced by Mr. Anderson, February 13, 1907, and referred to Committee on Transportation, prescribes limitations on the employment of telephone operators by railroads for duties connected with the despatching of trains.

SENATE BILL No. 410, introduced by Senator Sanborn, February 9, 1907, and referred to Committee on Judiciary, is a bill to amend sections 2 and 3 of chapter 304, laws of 1905, relating to the proceedings of commissioners on condemning lands by telegraph, telephone, power, heat and light companies.

SENATE BILL No. 510, introduced by Committee on Engrossed Bills, March 6, 1907, and referred to Committee on Transportation, provides for compulsory connection between competing telephone systems.

WYOMING.

HOUSE BILL No. 156 is an act to amend section 1 of chapter 50 of the Session Laws of 1901, relating to the assessment of railway, telegraph and telephone lines.

HOUSE BILL No. 87, introduced by Mr. Troyer, January 23, 1907, and referred to Committee on Corporations, prescribes conditions under which telephone wires may be erected over railway tracks, giving the Railroad and Warehouse Commission power to regulate such crossings, and making the minimum height 25 feet from wire to track.

ARKANSAS.

SENATE BILL No. 41, introduced by Arnold, Edmonson and Goodwin, makes it illegal to permit telephone wires, instruments or equipment to be used for the transmission of information for the use of bucket shops.

COLORADO.

SENATE BILL No. 283, introduced by Senator Parks, confers the right upon a telephone company to construct and maintain its lines and to cross upon or under railways and public highways, under proper conditions, and across public lands, and provides for the obtaining of rights of way either by the ordinary process of negotiation or by the exercise of the right of eminent domain.

CONNECTICUT.

HOUSE BILL No. 216, introduced by Mr. Higgins, and referred to Committee on Judiciary, provides that whenever portions of two telephone divisions or districts are included within the same town the charge for five minutes conversation between instruments located one in each district shall not exceed 10 cents.

ILLINOIS.

HOUSE BILL No. 381, introduced by Mr. Daugherty, February 20th, 1907, and referred to Committee on Municipal Corporations, is an act empowering cities, villages and incorporated towns to acquire, construct, maintain and operate telephone systems and other public utilities.

HOUSE BILL No. 199, introduced by Mr. McLaughlin, February 6th, 1907, relates to the placing of the control over wires to be strung over railway tracks with the Railroad and Warehouse Commission, and limits the height to not less than 25 ft. above the tracks.

HOUSE BILL No. 376, introduced by Mr. Smith, February 20th, 1907, and referred to Committee on Municipal Corporations, is a physical connection measure intended to compel telephone companies owning competing lines to connect their lines with each other. Rate limiting clauses fix a maximum rate for the rental of telephones at $3 per month for business houses, and $1 per month for residence, and a maximum rate for toll messages to any point within the State of Illinois not to exceed 75 cents for the first five minutes' conversation and 25 cents for each additional five minutes' conversation.

SENATE BILL No. 240, introduced by Mr. Glackin, February 14th, 1907, referred to Committee on Railroads, provides that it shall be unlawful to string wires over the tracks of a railroad except in such manner as shall be prescribed by the Raiload and Warehouse Commission upon application made after at least ten days written notice to the railroad whose tracks are so to be crossed, and such notice should state the time when application will be made and the proposed height and manner of stringing the wire. It is provided that in no case shall a distance less than 25 ft. be allowed between the tracks and any telephone wires.

HOUSE BILL No. 249, introduced by Mr. Walsh, February 7, 1907, provides that telephone companies shall pay a tax of $1 on every pole outside the corporate limits of a city and a $2 tax on every pole within the corporate limits of a city; also that whenever ten per cent. of the householders of any street, avenue or thoroughfare shall file a petition for the removal of a pole the officers of the city may cause the pole to be removed in the same manner as any other public nuisance may be removed.

HOUSE BILL No. 479, introduced by Mr. Lantz, February 27, 1907, and referred to Committee on Corporations, provides that all telephones shall be held to be common carriers, and that physical connection between all lines shall be obligatory, and that such connection shall be permitted by any telephone company upon receipt of five days' notice in writing from any person or corporation operating a line and desiring to connect in this manner. There is also a rate limiting provision in this measure, which states that no charge shall exceed 25 cents for a message to a point within fifty miles of the place of its origin, with an additional charge of one-half cent per mile for distances in excess of fifty miles for a five minutes' talk. Provisions are made for a division of earnings in case of interchanged service, also a rate-limiting clause applying to business and residential lines,

*Continued from the issue of April 13.

Digitized by Google

and a section requiring the use of the latest improved long distance telephones on all instruments.

HOUSE BILL No. 686, introduced by Mr. Geshkewich, March 13, 1907, and referred to Committee on Municipal Corporations, provides that telephone and other wire-using companies shall place all new wires under the surface of the streets, alleys and avenues in cities having a population of fifty thousand inhabitants or over, and that existing overhead wires shall be placed underground before the 1st of July, 1909.

INDIANA.

HOUSE BILL No. 198. This act provides that if any telephone company shall rebate any portion of the regular rate fixed by its contract or franchise such rebate shall be considered an admission that the maximum price fixed in the contract is unlawful and excessive, and shall operate as a consent to the reduction from the maximum price to the price fixed by the abatement, and that thereafter all customers shall be allowed similar rates for the same class of service.

KANSAS.

SENATE BILL No. 200, introduced by Senator Smith, is a bill providing that telephone companies shall refuse the use of their wires to a news agency which discriminates against any newspaper in the State.

SENATE BILL No. 235, introduced by Senator Blaker, makes it a misdemeanor to wilfully injure, molest or destroy any of the outside equipment of a telephone company.

HOUSE BILL No. 161, introduced by Mr. Davis, provides that every railway company shall, in each of its stations, before the 1st of July, install and maintain a telephone connected with each and every central office in the city, town or village lying nearest its station.

SENATE BILL No. 236, introduced by Senator Stewart, is an Act to authorize cities of the first, second and third classes to purchase, extend, maintain and operate, or to construct, extend, maintain and operate a telephone system or other public utilities. Such action may be taken as a result of a favorable majority vote at a special election held on petition of ten per cent. of the electors of the city.

MINNESOTA.

SENATE BILL No. 334, introduced by Senator Nelson, is a compulsory physical connection measure applying to two telephone companies having lines between two or more villages or cities, and having toll stations in such villages or cities.

MISSOURI.

HOUSE BILL No. 122, introduced by Mr. Gannaway, is an act to amend section 1255 of article 6 of chapter 12 of the Revised Statutes of Missouri, 1899. This act relates to the duty of all telegraph and telephone companies to provide facilities at their offices for the despatch of public business and to use proper care in the forwarding of messages.

NORTH DAKOTA.

SENATE BILL No. 23, introduced by Mr. Young, makes it illegal for any telephone company to give franking privileges to any persons, or to offer to any individual rates lower than those granted to the general public.

PENNSYLVANIA.

HOUSE BILL No. 272, introduced by Mr. Bliss, March 4, 1907, is an act authorizing cities and boroughs to impose license fees for the erection and maintenance of poles, and prescribes the amount of such license fees.

HOUSE BILL No. 77, introduced by Mr. W. S. Reynolds, January 14, 1907, requires that telephone companies entering upon or occupying any public street or highway shall first obtain the consent of any borough in which such wires are to be placed.

HOUSE BILL No. 306, introduced by Mr. McCullagh, January 28, 1907, and referred to Committee on Municipal Corporations, provides that municipal corporations in incorporated cities and boroughs shall have power to regulate by ordinance the service and tolls, and prescribe rates to be charged by telephone companies.

SOUTH CAROLINA.

SENATE BILL No. 306, introduced February 1, 1907, provides that all railroad and express companies shall be required to keep and maintain a telephone in each and every office located in a city or town having a telephone exchange.

SENATE BILL No. 587, introduced February 9, 1907, is an act intended to give the Railroad Commission jurisdiction over all telephone lines of companies supplying telephone service.

TEXAS.

HOUSE BILL No. 24. This bill provides that telephone companies shall be regulated by law as common carriers, and shall be compelled to provide means whereby all messages received by any company may be transferred to the lines of competing companies operating in the same district, or operating long distance lines. It is provided that the receipts for messages thus traversing the lines of one or more companies shall be divided in proportion to the mileage owned by the several companies. Appended to the printed copy of this bill is a protest against its passage from the owners of many Independent telephone lines in the State of Texas, signed by the officers of the Texas Independent Telephone Association.

WISCONSIN.

SENATE BILL No. 518, introduced by Committee on State Affairs, March 12, 1907, and referred to Committee on Transportation, provides that every telephone company operating a telephone exchange where long distance messages may be received shall maintain in its office a telephone of each company operating a telephone exchange in the same city, and shall notify any person, no matter to what system he may subscribe, when he is wanted on a long distance line.

RATE JUGGLING IN CANADIAN RURAL DISTRICTS.

INDEPENDENT companies operating in York and Ontario Counties, Ontario, Can., are meeting with generous support from farmers, to whom they are giving adequate opportunities to obtain telephone service at a reasonable price. The Bell company, which has during the years of its monopoly been unable to give service to these people at rates which they could afford to pay, has suddenly made a new discovery.

Near the town of Pickering it is reported that town connections have been offered to rural lines owners at a rate of $3 a year, much lower than any concessions which have ever been offered when there was no competition. Rates in other places are lowered, if there is competition—otherwise not. The Canadian people are, however, thoroughly alive to the significance of these movements, and are refusing to patronize the monopoly when rates are cut simply as a temporary measure to destroy a small competitor.

MANY KENTUCKY TELEPHONE MEN MEET AT PADUCAH.

(*Continued from page 252.*)

service outside of their particular county. His talk was very highly appreciated by all present and extremely interesting.

Mr. R. A. McCurdy, general manager of the Mayfield Home Telephone Company, gave a very interesting report on Graves County.

Messrs. J. L. Travis and W. B. Butler made a complete report on Marion. These gentlemen, together with their associates, have for some time been devoting all their energy to this particular territory, consequently their company is operating 370 subscribers and the Cumberland 6.

Mr. M. H. Story, general manager of Salem Exchange, talked very freely on the subject of rural lines and the most practical way to handle them.

Mr. J. C. Ramage, general manager of the Providence Home Telephone Company, told of the conditions existing at Providence. The Cumberland Telephone Company has for one week been closed down and many of the people are very much surprised to know they can reach almost any place they desire over the Providence Home Telephone Company's lines, which connect with long distance lines of the Central Home Telephone Company.

Mr. W. G. Turpin, general manager of the Henderson Home Telephone Company and secretary of the district, made an extensive talk on conditions in Henderson, Davies and Hancock Counties. Mr. Turpin's report was very encouraging, showing that conditions have improved very materially since the last meeting.

Reports which came in from all portions of the district indicated results satisfactory to the most optimistic, showing the subscribers' lists ever on the increase and toll business constantly growing; while on the other hand the business of the Bell company is practically at a standstill. Active preparations for an increased toll business, which will insure still greater prosperity, are being made by many of the companies.

Mr. F. G. Hoge, president, made the closing speech, giving a complete report of Christian and Todd Counties, and discussed the Independent telephone movement in general. He was elected delegate to the State convention at Louisville, April 16th. After a general vote of thanks to Mr. Jeffreys and the Paducah Home Telephone Company for their hospitality in entertaining the association, the meeting adjourned until called by the president.

IN THE OPERATING FIELD

TENNESSEE LEGISLATURE OPPOSED TO PHYSICAL CONNECTION BETWEEN COMPETING TELEPHONE COMPANIES.

THE Tennessee State Senate refused to endorse the physical connection bill which had been passed by the House of Representatives and the bill is now dead. The bill provided that all telephone companies be required to arrange physical connection with all other companies when the lines met at any point, so that patrons of one company could call a party on any other line. The bill was meant to force the long distance companies to give the rural lines the benefit of the toll service. The long distance companies objected on the ground that it would destroy their local business in the points where such connection should be made, and local companies because it would hinder development.

NEW BELL EFFORTS TO OBTAIN CONTROL OF TOLL BUSINESS IN INDIANA REPELLED.

WIDE publicity has recently been given, in the newspapers of Indiana, to an alleged attempt of the Central Union (Bell) Company to induce Independent exchange operators to handle Bell toll business, in consideration of the Bell Company giving up its local exchanges. In line with this policy it is reported that efforts are being made to discredit the efforts of the Independents who are making arrangements for an extended toll service of their own. Reports of the prospective sale of Independent plants which will be important toll centers have been circulated. Among those mentioned is the Home Telephone Company, of South Bend. That there is no truth in such reports is shown by the following letter from Theodore Thorward, president of the company:

"In answer to your letter in regard to the newspaper reports concerning the alleged attempts of the Bell Telephone Company to buy up the Independent exchange at South Bend, I wish to state that there is no truth in the matter whatever. The fact is, that the Bell Telephone Company, or rather Central Union Company, is very desirous of getting out of the exchange business in the State of Indiana, and is trying to make some kind of an arrangement whereby the Independent companies should take care of its toll line business in this State. In this arrangement it suggests that the Independent people should retain their own toll line business and only use the Bell long distance lines to points they can not reach on Independent lines.

"Its proposition has been very flattering, but I doubt whether the Independent companies will be willing to have anything to do with the matter.

"As far as the South Bend plant is concerned, the Bell Telephone Company will never be able to get control of it as long as the present stockholders retain their holdings in the company. The company as now constituted is very closely identified with Chicago Independent (Automatic) Telephone interests and they could not afford under any circumstances to tie up with the Bell in any way whatever.

"(Signed) THEODORE THORWARD, *President.*"

INDIANA TELEPHONE MEN MEET IN SEVENTH DISTRICT.

THE third meeting of the members of the 7th District of the Indiana Independent Telephone Association was held in Indianapolis April 10. It was the best attended meeting in the history of the district organization, and in enthusiasm has not been surpassed by any district meeting previously held. Each of the twenty-one companies in the district was represented.

President W. W. Mendenhall called for the report from members of the several companies present and this brought out news of a most encouraging condition.

Reports were read by Virgil Buntin, manager Lebanon Telephone Company; C. G. White, Arcadia Telephone Company; E. Hawkins, secretary of the Home Telephone Company, Noblesville, stating that in his city the Bell Company has only about 25 instruments to compare with about 700 operated by the Independent Company; J. J. Browne, secretary of the Consolidated Telephone Company, Danville; F. R. Strickler, secretary Franklin Telephone Company; George C. Hitt, secretary of the Indianapolis Telephone Company, reporting great improvements in respect to service during the past year; J. E. Newman, secretary Morgantown Telephone Company; O. P. Macey, manager Mooresville Telephone Company; Marvin Jessup, secretary of the Deming Telephone Company; C. M. Drake, manager of the Lewis Creek Telephone Company; C. B. Jones, of the Central Indiana Telephone Company; John W. Pyle, president of the Marietta Telephone Company; John Gant, treasurer of the Flat Rock Telephone Company; A. J. Newsom, president of the West Newton Telephone Company; J. M. Sandy, secretary of the Advance Telephone Co.; W. H. Ensminger, president of the Blue Ridge Telephone Co.; C. E. Wicker, of the Ripley Farmers' Telephone Company, and others reported progress, and described many improvements installed or to be installed and in every instance a satisfactory increase in the number of patrons. Several reported futile attempts made by the Bell Company to secure franchises, but these were repulsed even after free service for a year had in many cases been offered.

Twenty-eight members were elected as delegates to the annual meeting in May and W. W. Mendenhall was elected as the delegate to the International Convention to be held in Chicago in June. The election of officers resulted as follows: W. W. Mendenhall, Westfield, president; A. J. Newsom, West Newton, secretary-treasurer.

Charles S. Norton, secretary of the State Association, gave a brief talk about the annual meeting to be held in Indianapolis May 15, 16 and 17. Mr. Norton predicts that this will be the greatest telephone convention ever held outside of a national convention.

TEN THOUSAND MUNICIPAL TELEPHONES TO BE INSTALLED BY CITY OF WINNIPEG.

REVERSES have been coming thick and fast to the Bell Telephone Company in Canada during the past three months. First the electors of Manitoba voted in favor of government ownership of long-distance telephone lines, with municipal control of local exchanges; then dozens of towns and municipalities began preparing estimates of the cost of municipal systems, and the government of the province has called for tenders for poles and is preparing orders for materials sufficient for the building of 1,000 miles of long-distance lines as early as possible in the spring.

Last week, however, the climax was reached, when the Winnipeg city council, at a special meeting called for the purpose of discussing the telephone question, decided unanimously to ask the provincial government to construct a system in Winnipeg, the capital of the province, during the coming summer. The government was approached on the matter, and the special committee appointed to look after the matter received the assurance of Hon. J. H. Howden, minister of railways and telephones, that his government would construct such a system this summer and assume all liability for it, and at the same time would receive any profits which might be made from such a system. Winnipeg will require some 10,000 telephones, and it is understood

Digitized by Google

that the government will put the subscription price at the lowest possible figure to make the system self-supporting. Francis Dagger, provincial telephone expert, is now preparing figures for this system, and it is expected active construction will be commenced this spring.

BELL-U. S. INDEPENDENT MERGER BLOCKED.

SUMMONS and complaint have been served by Attorney-General Jackson of the State of New York on the American Telephone & Telegraph Company and various interests allied with it and on the directors of the U. S. Independent Telephone Co. of Rochester and their associates, pending the action to prevent a consummation of an attempted merger of the Independent company with the Bell organization. This action is supplementary to a temporary measure taken last February, and is due to evidence obtained at the hearings before Referee Joseph A. Lawson, where the testimony given by President Fish of the A., T. & T. Co., and other persons convinced the Attorney-General that the proposed merger was contrary to the interests of the people of the State of New York and in violation of the Donnelly anti-trust law in that it would constitute a monopoly in the telephone business in certain sections.

Pending the action which the Attorney-General is to bring in the courts, Justice Betts, of the Supreme Court at Albany, has issued an injunction restraining all the defendants mentioned from making any attempt to complete the transfer of the property of the U. S. Independent Co. or doing anything to promote any merger of this company with the American Tel. & Tel. Company.

HOW TO MAKE YOUR TELEPHONE DOUBLE ITS VALUE TO YOU.

It will cost you three or four cents a day more, but—Well, just look at this list:

It will save every bit of the stair climbing, up and down, and down and up again, that your telephone makes you do now.

It will put the doctor's voice at your ear in bed, day or night, at a moment's call.

It will put the police station and its resources within your elbow reach all night long.

It will give you a direct alarm wire from your bedroom to the fire department, and bring the department in all the hurry possible if you discover your house on fire, and are cut off from the first floor, perhaps.

It will allow your wife and the household to talk from one floor to the other without calling or stair climbing.

And what is this thing that can accomplish so many modern Aladdin's lamp wonders?

Just an extension to your telephone that you can have put in before a few more days are over, if you call up Main 294.

Do it now.

HOME TELEPHONE COMPANY.

An Example of Successful Newspaper Advertising Copy.

THAT NUMBER QUESTION AGAIN!

"NUMBER, please?" The dulcet tones of the invincible "hello" girl trilled the query into the waiting ear of the wag at the other end of the circuit.

"Give me two pairs of aces," came the answer.

"Do you think you're playing draw poker?" interrogated the girl at "Central."

"Certainly not," was the reply. "I'm calling a telephone number. Kindly let me have four ones."

"I'm afraid I don't understand," said the operator. "Can't you make your call clearer?"

"I'm doing the best I know how. Can you connect me with one, one, one, one?"

"Guess you've got the wrong number; try again."

"No, I haven't; it's in the book. Maybe you specify it as eleven eleven."

"Say, do you think this is a policy shop? What number are you calling?"

"I'm trying to tell you. See if you can give me one hundred, eleven, one."

"No, I can't," came the sharp reply. "I have no time to wait. If you cannot be more explicit you had better send a telegram."

"Why do you have such nonsensical numbers in your old books if you can't understand them?" argued the caller. "Here it is as plain as day—four ones in succession."

"Oh, you mean one, one, double one. Why didn't you say so? I'll connect you."

"Don't bother; I just wanted to discover how you called for that strange collection of figures. Good-bye."—*Exchange.*

CHICAGO SPECIAL COMMISSION OF TELEPHONE EXPERTS MAKES REPORT.

AFTER investigating as carefully as was possible in the time at their disposal, the expert commission, composed of Prof. Dugald C. Jackson, William H. Crumb and George W. Wilder, secretary, has made its report on telephone conditions in Chicago. This report is practically confined to the following four questions which alone were included in the instructions issued to the commission:

1. The feasibility of the proposed project of the Manufacturers' Telephone Company;
2. Relative merits of flat rate and measured rate telephone service;
3. The application for a franchise made by the Chicago Telephone Company;
4. The advisability of requiring universal toll connections by ordinance.

The project of the Manufacturers' Telephone Company has not been approved, principally on the ground that the time required for the construction of an adequate plant would be twice that which is allowable under present conditions and objections are also raised to the estimates presented by the company which were termed inadequate, and to the methods of charging and rates proposed. It is stated that the latter are not high enough to permit of the company's giving an adequate service and making a profit.

The institution of measured rates for business service is recommended particularly for the reasons that it is believed to give each user a just proportion of the entire expense of carrying on the telephone service and that measured rates will lower the number of useless messages which at the present time have been found to form an extremely large per cent. of the load of the exchanges of the Chicago Telephone Co., and cause countless annoyances owing to the frequency of "busy" reports, etc. The commission has found that the useless calls now account for approximately one-third of the total amount of the Chicago Telephone Company's operating expense and the elimination of this waste should make practical a general reduction in rates. Reasons are given why the limited use of flat rates in connection with residence and neighborhood exchange telephones may be advisable.

The methods of accounting used by the Chicago Telephone Co. are condemned in that they do not give any means of determining the absolute or relative costs of the different classes of service and it is recommended that in case the Chicago Telephone Co. be given a franchise it shall be compelled to start a separate set of records, so arranged as to afford data for determining the average cost of the several classes of service; these books to be accessible and kept under supervision of the city comptroller.

The report strongly condemns the idea of requiring an operating company to make connections with every applicant company. A large number of charts and estimate tables bringing out points in connection with the local situation, which have a valuable bearing in relation to the text, are included in the report.

TELEPHONE PATENTS

SELECTIVE TELEPHONE SYSTEM.

Harold Jackson Fisher, Hotchkiss, Col., patents (No. 847,283; dated March 12, 1907; filed August 26, 1906; serial No. 332,044) and assigns one-half to George H. Duke, Hotchkiss, Col., a selective telephone system.

This invention covers a selective telephone system employing ratchet wheels at the various stations, controlled by the operator at the central office by means of the associated polarized electromagnets. When the operator is called by a subscriber by the actuation of her drop, owing to the passage of current over the line from the generator at the subscriber's station, she answers, and after making the required connection depresses a key the required number of times to effect the desired changes at the called station, by the operation of a ratchet on the step by step principle over a circuit containing battery at the central office. This connects bell and talking circuits so that the desired subscriber may be rung and hold conversation.

METAL TUBE POLE.

Louis Blessing, Jackson, Michigan, patents (No. 846,001, dated March 5, 1907; filed December 30, 1906; serial No. 293,929) a metal truss telegraph pole.

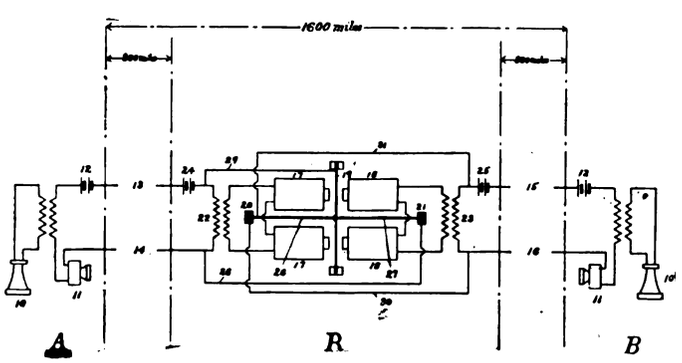
This invention covers a form of pole made of hollow metal tubes, reinforced by a zigzag truss work of steel wire.

TELEPHONE REPEATER.

Dilpert S. Dickert, Salt Lake City, Utah, patents (No. 847,656, dated March 19, 1907; filed May 22, 1906; serial No. 318,152) a telephone relay.

This patent covers a form of telephone relay or repeater. The toll line is cut in two and across the terminals of each side are bridged the primary sides of induction coils 22 and 23 in series with the local battery 12. The incoming current variatons are intended. to set up an induced current of greater intensity in the magnets 17 or 18, according to the station talking, which acts upon the common diaphragms 19, causing a corresponding movement of the bar 26, 27 and disturbing the granular carbon of the buttons 20, 21, thus varying the resistance.

The inventor states that in providing a common diaphragm

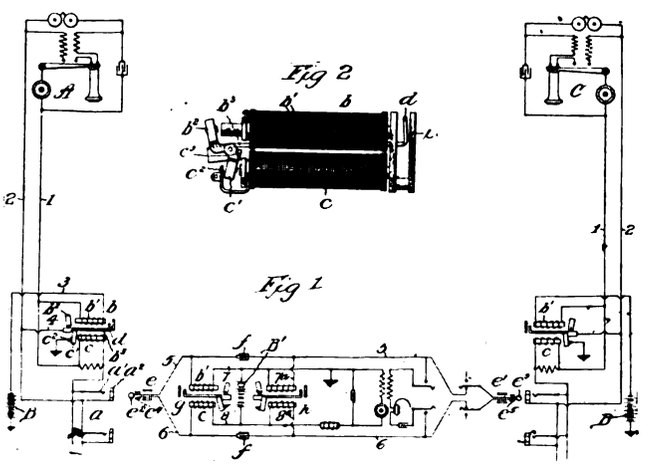


between the two sets of magnets the objectionable effect of repeating back to the sending station and the consequent confusion of vibrations is avoided. He also states that this does not occur as the primary coil becomes partly short circuited by the transmitter circuit, thus weakening the magnets and releasing the diaphragm, and thereby the attached contact rod, thus increasing the contact resistance of the transmitter buttons. In addition to this, as the diaphragm moves in either direction it decreases the resistance in one button, at the same time increasing the resistance in the other.

SIGNALING SYSTEM.

Frank R. McBerty, Evanston, Ill., patents (No. 849,336; dated April 2, 1907; filed July 11, 1902; serial No. 115,131; divided and this application filed January 20, 1905; serial No. 241,962) a signaling system for a telephone line.

This patent covers a line circuit using a special form of mag-



netic signal, shown in Fig. 2, and the use of a similar signal for supervision in a cord circuit. When the magnet b^1 is energized armature b^2, which normally overbalances the indicator and its rod b^3, is attracted, causing target d to be displayed through an opening in the face plate. Magnet c, when energized, attracts armature c^1, which by its movement moves the indicator to its concealed position. When telephone A is removed from the hook the associated line-signal is displayed, wire 4 and grounded contact c^2 being used to complete the circuit through magnet b^1.

When the operator answers current flows from the positive pole of battery B^1 through indicator displaying coil b^1 of supervisory signal and restoring magnet c of the line signal, being completed through the substation and restoring coil c of supervistory signal. The breaking of contact c^1 c^2 puts a test potential from battery B^1 on the thimbles of multiple jacks. The line signal is now held in the non-indicating position by current from battery B through both windings of the line signal to ground in the cord circuit, this circuit being independent of the telephone hook contact. When a telephone is replaced on the hook a circuit through supervisory magnet c is broken, but b^1 is still energized by current from battery B to the cord circuit ground, causing the display of the supervisory signal.

AUTOMATIC EXCHANGE-SELECTOR.

John G. Roberts, Chicago, Ill., patents (No. 848,398; dated March 26, 1907; filed June 18, 1906; serial No. 322,145) and assigns to Western Electric Company, Chicago, Ill., an automatic exchange selector.

This patent describes a selector for the central station whereby any subscriber may automatically connect his telephone with the line desired. The selectors, of which there is one for each line entering the exchange, comprise a combination of three relays,

Digitized by Google

cog-wheels, retaining pawls and a rotating shaft upon which is mounted a pair of springs for each line that may be selected. These springs constitute wiping contacts and are mounted on the shaft in spiral formation so that they may engage with multiple terminals arranged in an arc-shaped field only when the shaft has rotated the desired distance. The inventor does not show the device in the subscriber's instrument that must be used to cause an actuation of this selector.

TELEPHONE TRANSMITTER.

James Michael Dempsey, Chicago, Ill., patents (No. 845,062; dated Feb. 26, 1907; filed November 30, 1906; serial No. 345,718) and assigns three-tenths to William B. Beckman, Fayetteville, Arkansas, and three-tenths to Harry T. Rogers and one-tenth to Madeline Dempsey, both of Chicago, Ill., a telephone transmitter.

The inventor describes a telephone transmitter in which the motion of the sound-receiving diaphragm is multiplied by means of a system of levers which impart the augmented vibrations to one electrode of the resistance chamber. This chamber has a rigidly supported rear electrode. Means are also provided whereby the granular carbon may be stirred occasionally by a hand-actuated churning arrangement, so as to prevent packing.

WATCH CASE RECEIVER MAGNETS.

Aaron E. Harrison, New York, N. Y., and Crowell M. Haslett, Jersey City, N. J., patent (No. 845,546; dated February 26, 1907; filed September 9, 1905; serial No. 277,668) a telephone magnet.

This patent covers a form of watch case receiver magnet, consisting of several semi-circular, permanent magnets laid up to form a circle with like poles adjacent. To them are attached, at the poles, pole pieces extending upward obliquely, and upon these are wound the electro magnet coils.

The inventors claim for this magnet a greater number of lines of magnetic flux confined within a given area than may otherwise be obtained, giving a receiver that is sensitive to a greater degree than is usual, and one particularly adapted to wireless telegraph receiving.

AUTOMATIC TELEPHONE SELECTOR.

August Alvin Monson, Minneapolis, Minn., patents (No. 847,355, dated March 19, 1907; filed March 31, 1906; serial No. 309,201) signaling apparatus for telephones. This invention relates to a selector which may be set at the number of the station desired, and then returned to the zero position by hand. On its return the proper number of impulses are sent out by making and breaking the switch-controlling circuit.

TELEPHONE CALL-RECORDER.

Richard W. Shoemaker, Pasadena, Cal., patents (No. 840,718; dated Jan. 8, 1907; filed Feb. 13, 1905; serial No. 245,381) and assigns fifty-five one-hundredths to Reginald H. Shoemaker, Jr., Pasadena, Cal., a visual recorder for telephone systems.

This patent covers a device located at the subscriber's telephone and so connected with it that it may be operated by the central office operator, in event of a call being made for the subscriber during his absence. The device comprises six relays variously connected to operate, with current furnished from the central office, a disc having on its periphery letters or figures by means of which the number of a person calling the absent subscriber may be printed upon a paper tape.

AUTOMATIC COIN COLLECTOR.

Edwin H. Smythe, Chicago, Ill., patents (No. 846,628, dated March 12, 1907; filed December 21, 1905; serial No. 292,770) patents and assigns to the Western Electric Company, Chicago, Ill., an automatic coin collector system.

This invention has to do with a system whereby the calling subscriber deposits a coin in order to secure the attention of the operator, the coin being automatically returned to the calling subscriber should he be unable to signal the central office.

The inventor describes the system as one in which the coin is under the control of the operator after connection has been made with the calling subscriber in order that the coin may be returned in event of not being able to secure the desired connection, and in which the coin is automatically deposited in the coin receptacle upon the taking down of the connecting cords by the operator.

PARTY-LINE LOCK-OUT SYSTEM.

Herschel R. Turner, Hoxie, Kansas, patents (No. 842,822; dated Jan. 29, 1907; filed May 12, 1906; serial No. 316,578) a telephone system.

This patent covers a step-by-step selective system in which the selecting mechanism is operated by a relay actuated by the power obtained from the hand generator, the speed of which is controlled by a revolving governor. Upon reaching the proper point of selection the generator automatically ceases to actuate the relay and the current is utilized in ringing the bell of the called subscriber.

LINEMAN'S CHAIR.

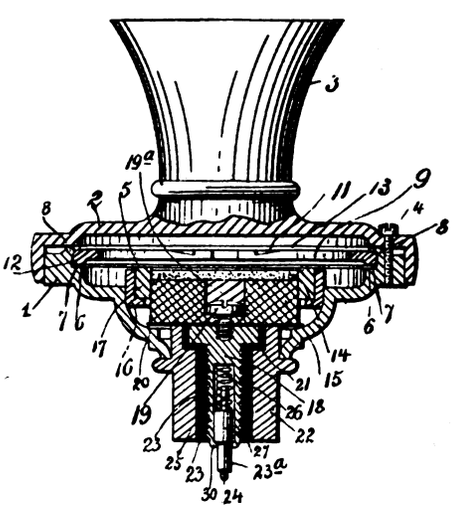
Geo. P. Yeakel and Wharton C. L. Ireland, Norristown, Pa., patent (No. 844,641; dated Feb. 19, 1907; filed Sept. 14, 1906; serial No. 334,693) and assign one-third to Charles Keller, Norristown, Pa., a lineman's chair.

This patent covers a form of lineman's car for riding a messenger wire, in which sprockets and chains are provided, together with a hand operated crank as a means of propulsion by causing the rotation of the wheel which rides on the messenger.

TRANSMITTER.

Alfred Larrsson, Buffalo, N. Y., patents (No. 840,069; dated January 1, 1907; filed January 23, 1906; serial No. 297,425) a telephone transmitter.

This patent covers a form of telephone transmitter in which the diaphragm is held firmly in place by means of the resilient



spring 9, which is inserted between the diaphragm 5 and the under surface of the annular groove 8.

Means are provided, also, for making contact with the back electrode by means of a spring 26, the connection to the front electrode being accomplished through the shell and diaphragm.

A tinfoil diaphragm is provided in front of the main diaphragm to exclude dust and moisture.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

RING BOLT DISTRIBUTION.

THERE are many places in cities and towns of moderate size where the most convenient and economical method of distribution is to run wires in twisted pairs along the face of a brick wall of a building, and take off individual pairs to windows, etc., wherever required. The method of fastening the wires is very important. The Peirce Specialty Company, Elkhart, Ind., recommends the ring bolt illustrated in Fig. 1 on this page, which is designed especially for this purpose.

It is a combination of a split bridle ring with a Peirce expansion bolt head, made of ¼-inch round steel, heavily galvanized. In order to fasten it in place a hole is drilled in the masonry, the bolt inserted, and the lead sleeve, which is at the back of the head, is driven or swaged back upon the wedge-shaped head. The sleeve is then compressed into every crevice of the masonry, giving exceptionally good holding power.

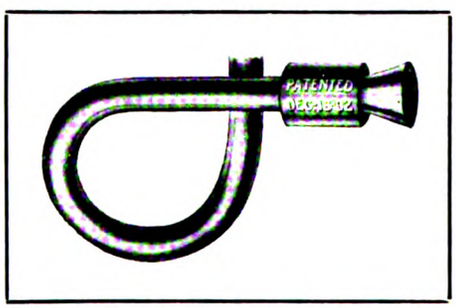

Fig. 1. Peirce distributing ring, for use on brick walls.

The appearance of a lead along a brick wall, using twisted pair wires run through the Peirce ring bolts, is shown in Fig. 2. The company manufactures a great variety of supplies for the distribution of telephone wires, and will send its catalogue describing them free of charge upon receipt of a request to any interested telephone man.

PETER F. HENSEL, of the Hensel Electric Construction Co., Chicago, Ill., has taken the Western agency for the line of telephone apparatus manufactured by the S. H. Couch Co., of Boston.

The installation of private systems in hotels and small installations of automatic systems are the specialties to which Mr. Hensel will devote his attention and in this connection he feels that the line of equipment manufactured by the S. H. Couch Co. will fill a long felt want and be most admirably adapted for this class of work.

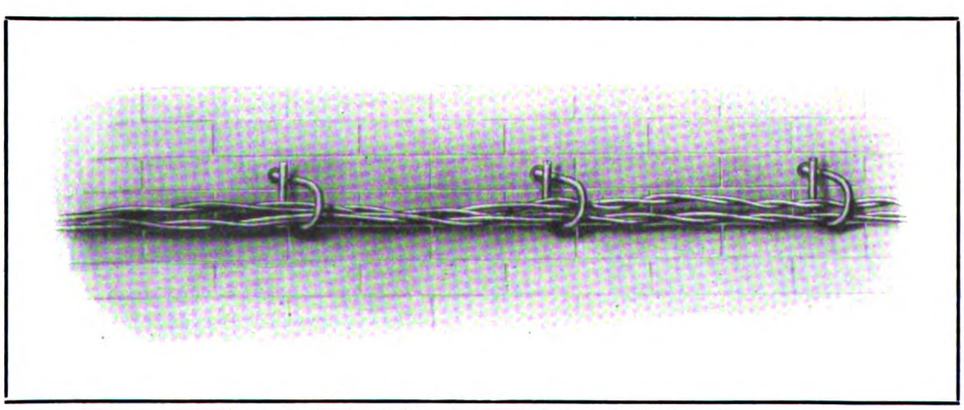

Fig. 2. Twisted pair laterals, run in Peirce distributing rings.

Mr. Hensel, who has had twelve years' experience in intercommunicating telephone construction and installation, will open an office at 324 Dearborn st., where he will carry a complete stock of standard telephone supplies for interior systems, and where he will be pleased to meet any one interested in this line of work.

EWING-MERKLE ELECTRIC CO., 1106 Pine St., St. Louis, Mo., publish in the latest issue of *Everbest Magazine* a discussion of instruments which may be used to call either the central office or the remaining stations on a party line. All that is necessary for the equipment of existing systems for this type of selective service is to insert a push button in the instrument circuit in the manner shown in the article. A copy of the book will be sent to any person who operates rural lines on receipt of a request.

WESCO SUPPLY COMPANY, St. Louis, Mo., has just issued a new Bulletin, No. 75, which tells about some of the products of the company's new telephone factory. The Bulletin covers a complete list of magneto telephones and switchboards as well as prices on materials and supplies for telephone line construction. The company draws especial attention to the high standard of quality it maintains in the construction of all its apparatus, as well as to its prices. Copies of the bulletin will be sent free on receipt of a request.

MR. A. J. KENNEDY, who has been with the Stromberg-Carlson Telephone Manufacturing Co., of Rochester, N. Y., for a number of years, in its engineering and later in the sales department, has associated himself with The Wire & Telephone Company of America, as travelling representative of this company's sales department. Mr. Kennedy has a broad acquaintance in the telephone field, and will no doubt be no small factor in developing the sale of this company's already rapidly increasing business.

THE DEAN ELECTRIC COMPANY will soon ship the new Erie, Pennsylvania, switchboard from its factory at Elyria, Ohio. This common battery multiple, 6,000 capacity board, is one of the best that has ever been put out by the Dean Company.

The new equipment replaces the old Paca-Miller system, in which the board proper consists of multiple jacks only, the drops being on the wall above and in the rear of the board.

Two thousand, three hundred and eighty lines are equipped and ready for service, also forty magneto lines for rural service. This shipment includes a three-position chief operator's desk and a three-position wire chief's desk, both being provided with space in the center for card indexes. The main and intermediate frame and relay rack, also complete power plant, except the battery, are all furnished and will also be installed by the Dean people.

A standard Dean four-party harmonic outfit in duplicate for ringing goes forward with the new board. The Erie board is equipped with the Dean line and cord test on every position for testing lines and cords.

AMERICAN CONDUIT CO., New York, Chicago, and Los Angeles, Cal., has just prepared bulletin No. 221 in the shape of instructions for cement testing, printed in concise form upon a postal card. Telephone managers and superintendents of construction, may have this card free of charge by writing to the company.

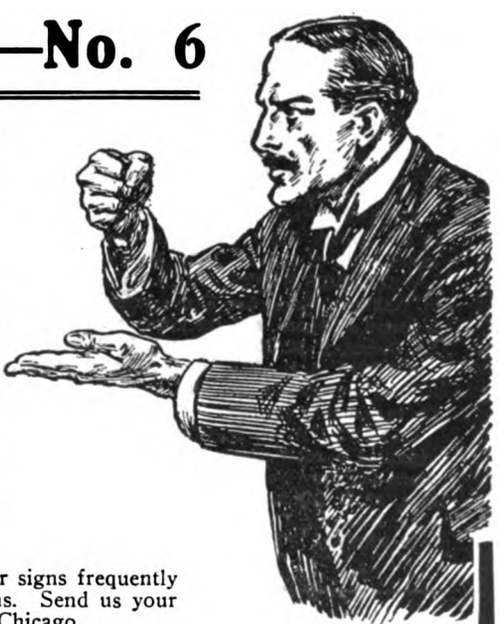
Talks With The Buyer—No. 6



I want to digress from my "Talks" on our telephone apparatus and its particular adaptability to your requirements long enough to call your attention to another of our special price offerings.

We had designed and made for us a very large number of especially attractive

New Pay Station Signs

These signs are beautifully enameled on heavy gauge steel in red, white and blue lasting colors. The design appears on both sides. Flanged for support. These signs have been adopted by the International Telephone Association. They are better than any other sign which has ever been offered the telephone trade, both in the quality of the sign and the fact that on the 18 x 19½ size the words "Telephone Pay Station" appears; not shown on any other such sign. I wish it were possible for me to show you here a cut of the three-color signs, but I am mailing you illustrations direct, and assure you that they are especially seasonable offering at the following prices:

No. 10—18 x 19½ size.		No. 12—8 x 18 size.	
Lots of 5	$1.00	Lots of 5	$0.65
" " 15	.90	" " 15	.60
" " 25	.85	" " 25	.54
" " 50	.80	" " 50	.50
" " 100	.70	" " 100	.45

The signs on which I am quoting must not be confused with the cheaper signs frequently offered the telephone trade. This is the time of year to put out your signs. Send us your orders for immediate shipment. Delivery F. O. B. St. Louis, Dallas or Chicago.

NEW COMPANIES.

MORELAND, ARK.—An Independent telephone company has been organized at Moreland, and the following officers elected: U. Hudlow, president; R. H. Vaughn, vice-president; T. B. Ludwick, secretary; F. N. Duvall, treasurer.

BROOKVILLE, IND.—The Brookville-St. Peters Telephone Company has been incorporated with a capital stock of $10,000. It is its intention to build a telephone plant in Brookville and throughout Franklin County. I. D. Garrignes, Charles Kretch, F. A. Wright and R. H. Cook are among the directors.

OLDS, IA.—Articles of incorporation have been filed by the Mutual Telephone Company, of Olds. The capital stock is placed at $14,000, divided into 400 shares of $35 each. The directors of the new company are Everett Swanson, Thos. Schooley, Henry Ingmanson, Chris. Miller, Elmer Hooper, Frank Young, Louis Eveland, C. H. Johnson, L. W. Canby, Peter Nicholaus and John Zickafoose.

SHELDAHL, IA.—The Sheldahl Telephone Company has filed articles of incorporation. It has an authorized capital stock of $6,000, and the incorporators are A. Frick and others.

CALEDONIA, MINN.—A farmers' telephone company, to be known as the Dandelion Telephone Company, has been organized by the farmers living north and northeast of Caledonia, and the following officers elected: Chas. Keucker, president; Daniel O'Leary, secretary, and Axel Anderson, treasurer.

JACKSON, MINN.—The Middletown Farmers' Telephone Company, of Jackson County, has been incorporated with a capital stock of $3,000. The incorporators are T. D. Sawyer, Geo. Withers and J. A. Sayles, of Jackson.

WELLSVILLE, N. Y.—Articles of incorporation have been filed by the Hanover Hill Mutual Telephone Company. It has a capital stock of $200, and the incorporators are Henry Hornburg, M. F. Vossler, Carl Schrader, Wellsville, N. Y., and others.

MINERAL CITY, O.—The Beggar's Run Telephone Company, with a capital stock of $3,000, has been incorporated by A. L. Boyd, Thomas Herrod, Nicholas Fulk, Ira Dilley, E. S. Dilley, John Stahlecher, L. H. Farber and A. L. Strawn.

RAINSBORO, O.—Articles of incorporation have been filed by the Rainsboro Home Telephone Company. It has an authorized capital stock of $10,000, and the incorporators are J. B. Upp and others.

BURLINGTON, OKLA.—The North Union Telephone Company has been incorporated with a capital stock of $10,500. The directors are Henry Welch, Wm. Alberding and Frank Veach, of Kiowa, Kas.; Jos. Fash, of Capron, Okla.; C. F. Keeler and Wm. Mahoney, of Drum, Okla.

KINGFISHER, OKLA.—Articles of incorporation have been filed by the Huntsville Telephone Company. The capital stock is named at $2,700, and the directors are M. B. Gillinan, E. M. Hale and Joseph Thomas.

BRINSMADE, N. D.—A farmers' telephone company is being organized at Brinsmade to construct a line into Normania township, where it will connect with the Normania-Ferry line. E. E. Haney has been made president of the company.

SHIRLEY, OKLA.—An Independent telephone company, to be known as the Shirley Rural Telephone Company, has been incorporated with a capital stock of $1,000. J. M. Brown and others are the incorporators.

WALLING'S STORE, OKLA.—The Whiskey Creek Telephone Company, of Walling's Store, has filed articles of incorporation. The capital stock is placed at $5,000, and the incorporators are C. M. Barnes, C. C. Hopper, Ed. Owens, J. M. Hooper and J. D. Moore, of Hastings.

SALUDA, S. C.—The Saluda Telephone Company has been organized, and it is its intention to establish an exchange at Saluda and build lines into the surrounding country.

CANASTOTA, S. D.—The farmers in the vicinity of Canastota have organized a rural telephone company to be known as the Farmers' Telephone Company No. 2, and the following officers have been elected: President, M. E. Mitchell; vice-president, Samuel Morrow; secretary, John Parsons; treasurer, Chas. Kostboth.

EVERMAN, TEXAS.—Articles of incorporation have been filed by the Everman Telephone Company. The capital stock is given at $5,000, and J. M. Scott is among the incorporators.

WEST, TEXAS.—The Home Telephone Company, of West, has been incorporated with a capital stock of $25,000. Among the incorporators are E. Rotan, J. B. Earle and others.

FERRYVILLE, WIS.— The Ferryville Telephone Company, with a capital stock of $1,000, has been incorporated by I. B. Hayden, F. E. Rutter, D. L. Rutter and others.

SHELL, WYO.—The Shell Telephone Company, with a capital stock of $1,500, has been incorporated at Shell, and it is its intention to construct a line to Greybull.

PINCHER CREEK, ALB., CAN.—An Independent telephone company is being formed at Pincher Creek, and application is being made for a franchise. Address S. W. Berry.

NEW GLASGOW, N. S., CAN.—An Independent telephone company has been organized at New Glasgow, and a charter procured. It is the company's intention to construct and operate a line from New Glasgow to Pictou.

LEITRIM, ONT., CAN.—An Independent telephone company has been formed to erect a telephone line from Leitrim to Billings' Bridge. Messrs. Kemp and Morris are among those interested in the enterprise.

POINTE AU PIC, QUEBEC, CAN.—La Campagnie de Telephone de Charlevoix et de Saguenay has been incorporated with a capital stock of $40,000. Its principal place of business will be at Saint Etienne de la Malbaie. Among the incorporators of the new company are Jean Warren, Charles Warren, Pointe au Pic, and L. A. Bouliane, St. Etienne de la Malbaie.

FRANCHISES.

CRETE, NEB.—The Independent Telephone Company, of Lincoln, has applied for a franchise in Crete.

NORTH YAKIMA, WASH.—Application for a telephone franchise at this city has been made by the Cowiche Telephone Company, of Cowiche.

RAINIER, WASH.—Permission to construct and operate a telephone line from Rainier to Yelm has been granted by the board of country commissioners to A. B. Smith, of Rainier.

FINANCIAL.

DAVIS, ILL.—The capital stock of the People's Mutual Telephone Company has been increased from $10,000 to $15,000.

MILLSTADT, ILL.—The West Side Telephone Company has increased its capital stock from $1,140 to $2,700.

CYCLOPEDIA OF APPLIED ELECTRICITY

5 large volumes each nearly one foot high — 2500 pages

Bound in red morocco, fully indexed. Contains 2,000 full page plates. Diagrams, Descriptions, Formulæ, Sections, Tables—supplemented by practical test questions—prepared especially for practical men who have no knowledge of advanced mathematics by such noted authorities as F. B. Crocker of Columbia University and the Crocker-Wheeler Company, Prof. Esty, Head of the Department of Electricity, Lehigh University, and others.

FOR THE TELEPHONE MAN

This Cyclopedia thoroughly explains all the duties of the manager, lineman, switchboard and troubleman. It not only fully explains the entire operation of a working telephone system, but it tells how to construct such a system. Treats fully on the Automatic Telephone and Wireless Telephony. Filled with information on electricity in all its forms—undoubtedly the best set of books for the telephone man who wishes to secure a fine position and a large salary.

REGULAR PRICE, $30.00. **SPECIAL PRICE, $19.80.**

Sent express prepaid for 5 days' FREE examination.

If the books meet your needs, pay $2.00 cash and $2.00 a month thereafter, until you have paid $19.80, the special price. Return, at our expense, if you do not care to keep the books.

We make this greatly reduced price for 30 days to interest the public in the superior character of the instruction of the American School of Correspondence—these books being compiled from the relative instruction papers of the school. A 200-page handbook fully describing 60 courses in Engineering sent FREE on request if you mention American Telephone Journal.

NATOMA, KAN.—The officers of the Natoma Telephone Company are A. C. Daggett, president; T. C. Snodgrass, vice-president and treasurer, of Waldo.

CHARLOTTE, MICH.—The Eaton Telephone Company has elected the following officers: President, George Williams; vice president, Richard Bohn; secretary, J. Upright; manager, W. Reeves.

ELWELL, MICH.—The following officers have been named by the Elwell Telephone Company: President, W. C. Pugsley; vice president, E. B. Huff; secretary, Seely Amsbury; treasurer, Alton Wiley.

WAYNE, MICH.—At a recent meeting of the People's Telephone Company the following officers were named: President, Jos. Waltz, of Waltz; vice-president, E. C. Maxwell, Carleton; secretary, F. L. Edwards, Carleton.

EDGERTON, MINN.—At the annual meeting of the Enterprise Telephone Company, held at Edgerton, C. S. Howard was elected president; R. B. Hinkly, vice president; L. W. Lockwood, secretary; F. E. Douty, treasurer.

MANKATO, MINN.—The Mankato Citizens Telephone Company has elected the following officers: H. A. Patterson, president; N. Petersen, vice president; W. D. Willard, secretary-treasurer; W. A. Funk, attorney.

MORA, MO.—The Mora Telephone Company has named John M. Moss, president; T. W. Goodknight, vice-president; B. A. Dump, secretary; A. O'Farrell, treasurer.

HUMBOLDT, NEB.—The following directors have been elected by the Speiser Mutual Telephone Company: C. Lionberger, president; E. Uhri, Louis Stalder, Joseph Petrashek, John Holechek, Chas. Gunzenhauser, R. F. Conrad, secretary and treasurer.

NEBRASKA CITY, NEB.—The following officers have been elected by the Nebraska City Telephone Company: N. A. Duff, president; Henry Schwake, vice-president; A. M. Munn, secretary and treasurer; R. A. Duff, general manager.

WASHINGTON, PA.—The following directors have been elected by the Farmers' Mutual Telephone Company: J. C. C. Pease, R. L. Munce, R. G. Lutton, S. O. Black, R. B. Blaney, S. N. Hopper, H. A. Day, William Coursin, C. M. Linn, H. P. Monnelauer, J. R. McPherson, J. Willis Martin, B. K. McConnell, H. H. Bebout and John Fulton.

WINTERS, TEXAS.—The Winters Independent Telephone Company, recently incorporated, has elected the following directors: F. L. Pierce, R. A. David, L. A. David, J. L. Allred and M. J. Sanders.

WINCHESTER, VA.—The Frederick & Clark Telephone Company has elected the following officers: President, Charles Mullikin; treasurer, Shirley Carter.

ONANCOCK, VA.—The Accomac & Northampton Telephone Company has elected the following officers: Frank Fletcher, president; John M. Bloxom, vice-president; directors, J. W. Bowdoin, W. W. Kerns, N. T. Mason and J. N. Fletcher.

BELOIT, WIS.—The following officers have been elected by the Farmers Telephone Company: President and manager, Geo. Gesley; vice-president, John Jones; secretary and treasurer, E. H. Skinner.

MEDICINE HAT, ALB., CAN.—The Alberta Southeastern Telephone Company has elected the following officers: President, S. T. Fawcett; vice-president, F. L. Crawford. Directors: John Huston, W. C. Harris, W. Rutherford, G. H. Smibert and J. H. Spencer.

MISCELLANEOUS.

CUMBERLAND, O.—The telephone line running from Cumberland to Spratt has been acquired by D. C. Carter, of Cumberland.

MORGANVILLE, KAS.—The name of the Farmers' Home Telephone Company has been changed to the Swedish Telephone Company.

CLARESHOLM, ALB., CAN.—The ratepayers of Claresholm are discussing the advisability of organizing for the purpose of erecting a municipal telephone system. Address W. Moffat.

MEDICINE HAT, ALB., CAN.—The city council has unanimously decided to prepare a by-law to raise sufficient money for the installation of a municipal system. Address F. G. Forster, Mayor.

BRANDON, MAN., CAN.—The city council unanimously passed a resolution in favor of the immediate construction of a municipal system, and Hon. J. H. Howden, minister of telephones for Manitoba, has promised his assistance. Address S. E. Clement, Mayor.

VIRDEN, MAN., CAN.—At a recent meeting of the city council it was decided to at once make arrangements for the construction of a municipal telephone system. Address A. G. MacDougall, clerk.

PERSONAL.

I. I. PYLE has been appointed manager of the exchange of the Delaware & Madison Telephone Company at Anderson, Ind.

HOWARD KEYSER, formerly county manager for the Sunset Telephone Company at San Bernardino, has been appointed manager of the district of which the headquarters is located at San Jose, Cal.

New Construction in the Field

BIRMINGHAM, ALA.—The Home Telephone Company, which is constructing a trunk line from Louisville to New Orleans through Nashville, Birmingham and Mobile, has completed the line to Birmingham with the exception of about ten miles out of Columbus, Tenn., toward Nashville. This gap will be closed within a week, and the through line will be in service.

ENSLEY, ALA.—Many improvements are being made by the People's Telephone Company at Ensley, Ala.

CISNE, ILL.—The lines of the Farmers' Telephone Company are to be extended.

LENA, ILL.—The Freeport Telephone Company is rebuilding its lines between Lena and Pearl City.

LEBANON, IND.—It is the intention of the Lebanon Telephone Company to erect and equip a new exchange building in this city, and also to change the magneto system to that of a full common battery system.

MAJENICA, IND.—Additional lines are being erected by the Majenica Telephone Company.

KEOKUK, IA.—Considerable construction work is to be done by the Mississippi Valley Telephone Company at Keokuk.

SALEM, IA.—A line to Denova from Salem is one of the improvements planned by the Salem Telephone Company.

OAK HILL, KAS.—It is the intention of the Farmers' Mutual Telephone Company to build a trunk line to the county seat.

GRAND RAPIDS, MICH.—The Citizens' Telephone Company is at work on the installation of its new system at Holland.

WAYNE, MICH.—The People's Telephone Company contemplates the erection of a number of rural lines.

MADELIA, MINN.—A new rural line from Madelia through Fieldon township is to be erected by the Madelia Telephone Company.

NEW ULM, MINN.—Many new rural lines are to be erected by the New Ulm Rural Telephone Company.

RUSSELLVILLE, MO.—The Russellville Telephone Company has extended its system into Jefferson City.

NEBRASKA CITY, NEB.—It is the intention of the Nebraska City Telephone Company to expend a large amount of money in improving its system. A new exchange building is to be purchased and a new switchboard installed.

WILSON, N. C.—An entire new system is being installed by the Carolina Telephone & Telegraph Company at Wilson.

SINCLAIRVILLE, N. Y.—The Independent Telephone Company, of South Stockton and Centralia, is installing its system at Sinclairville.

BRANDT, O.—Lines connecting Brandt and Sulphur Grove are being constructed by the Home Telephone Company, of New Carlisle.

MAGREW, O.—A new exchange is to be installed by the Urbana Telephone Company, of Urbana, at Magrew. The exchange will start with about one hundred telephones.

CHIPPEWA FALLS, WIS.—Many improvements in its system are planned by the Chippewa County Telephone Company.

OREGON, WIS.—Among the improvements planned by the Dane County Telephone Company is the construction of a line from Oregon to Stoughton.

PORTAGE, WIS.—A new line from Merrimac to Portage is being constructed by the Portage Telephone Company.

MACLEOD, ALB., CAN.—The Alberta Government is building a long distance line from this city to Coleman.

MACLEOD, ALB., CAN.—The MacLeod Telephone Company has decided to put its plant in shape and make connections with the long distance lines north of this city.

TO BE FOREWARNED IS TO BE FOREARMED

If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.
LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

SOAKED IN WATER NINE DAYS

WORKS AS WELL AS EVER

This is the unsolicited statement of Mr. Price, Manager of the SHARP COUNTY TELEPHONE CO. of EVENING SHADE, ARK.

This is what he says:

EVENING SHADE, ARK., March 23, 1907.

WESCO SUPPLY CO., St. Louis, Mo.

Dear Sirs:

I received a card not long since from the ——— Telephone Co. stating an accident occurring to one of their telephones. Now, I had an accident near Evening Shade in which I lost one of the Wesco Bridging Telephones in the river. The telephone was under water 9 days when it was recovered and dried out. The varnish is still good except the box looks white. All the workings are all right except the induction coil, which had to be replaced. Outside of the looks and a little mud to be cleaned from the workings, the Telephone is O. K.

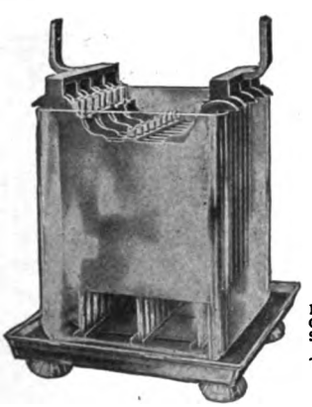
I am carrying it around as a show and test instrument.

Yours very truly,
C. C. PRICE, Manager.

Send for our New Bulletin No. 75 and get our prices on WESCO HONOR-MADE TELEPHONES.

THE WESCO SUPPLY CO.

FT. WORTH, TEX. ST. LOUIS, MO.



CLAIMS FULFILLED

Viewed from the standpoint of scientific theory, no other storage battery plate can compare, detail for detail, with the Gould Integral Plate. Many of the largest Telephone Companies in the United States have purchased Gould Storage Batteries on the *very apparent* merit of our battery. It is a most significant fact that in almost every such case. *repeat orders* have followed the first test order. The Gould Battery has succeeded because it has made good our claims for its unusual merit and economy.

Write for our catalogues.

JUST A SUGGESTION

Take one of your busy 4-party lines and equip it with "POOLE" Lock-Outs. Leave it in service a month and then see how many of the four will stand a raise of $3.00 a year rather than go back to the old way. We know the answer, but we want your subscribers to impress on you the fact that the "POOLE" Lock-Out is a rate-raiser.

It won't cost you anything to try it, because we will loan you the Lock-Outs free and there is no other equipment required. Write today for our Booklet AL-2.

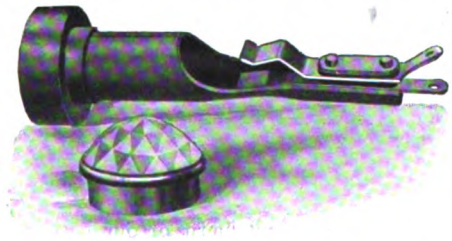
DEAN TELEPHONE APPARATUS

SUPERVISION

POOR SUPERVISION MEANS POOR SERVICE

Strip of Line Lamp Jacks.

ALL the lamp jacks used on Dean Common Battery Switchboards are of the tubular type, not depending in any way on the mounting for holding the lamp or lamp caps in place. The lamp jacks are so constructed that heat from the lamp is quickly radiated, obviating any damage caused by over-heating.



Pilot Lamp Jack.

Dean line lamp jacks are mounted on a rigid metal strip as shown in cut. The lamp caps are made in the form of a guard, from tempered spring steel, preventing breakage of the translucent covers, the lamp, and the accumulation of dust and dirt over the lamps which happens when the covers become cracked, making the supervision dim.

Dean line lamp caps are easily removed, being held in place by spring pins, which pass through the lamp jack mounting. The numbers furnished with our caps are removable and interchangeable. The opals used on our pilot lamps are large, making a bright but evenly distributed light. Our supervisory lamp jacks are all self-contained and have steel opal guards. They in no way depend on the mounting on the board for holding the lamp in position. Perhaps we could give you some new information on supervision. Write us, care Department B.

Supervisory Lamp Jack.

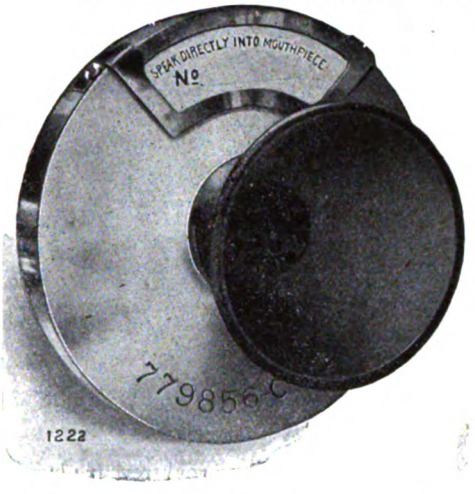
"STROMBERG-CARLSON"

Compact Type and "Central Energy" Style BRIDGING TELEPHONES

Are Equipped with The "Stromberg-Carlson" Transmitter

No. 2 Card Frame includes Bristol Board card marked as shown in illustration with blank space for subscriber's telephone number. Special cards furnished at small additional expense if required.



A separate mounting lug may be furnished with this transmitter when necessary to mount transmitters on arms not originally designed and drilled for our transmitter. The name on the transmitter back is a guarantee.

No. 7-B TRANSMITTER WITH No. 2 CARD FRAME
(The letter C affixed to serial number designates *Common Battery* or *Generator Call.*)

This No. 7 type Solid Back Transmitter is a leading product of "Stromberg-Carlson" quality—the acme of mechanical perfection—the most efficient transmitter—giving absolute satisfactory service over short and long distance lines under all conditions in every part of the world to-day.

We make a superior transmitter, because we are the only manufacturer making everything that goes into our transmitter and because we adhere to the scientific and theoretical principles of construction necessary to produce a perfect transmitter.

Every ounce of granular carbon and every polished carbon electrode used in Stromberg-Carlson transmitters is made in our **Carbon Mill** in Rochester, where the process of grinding and refining carbon is under our constant surveillance.

The front is **formed** and **drawn** from a special grade and quality of sheet brass. A 1,000 pound drop hammer was installed to do this minor operation. Every detail is made with the same care, and expense has not been considered in developing each article required in a perfect transmitter.

The mica diaphragm is clamped securely and uniformly around its entire periphery, making the carbon chamber ABSOLUTELY MOISTURE PROOF. With this construction the mica diaphragm is the controlling factor and must be tuned to a pitch equal to the average pitch of the voice. We have determined this feature, after a long, thorough study and series of exhaustive tests, resulting in a form of solid back transmitter that excels any other form of transmitter on the market to-day.

This tuned diaphragm will respond readily with the voice waves, producing a MAXIMUM VIBRATION, which in turn results in LARGE VOLUME with EXCELLENT ARTICULATION.

We give every part and every assembled transmitter mechanical and electrical tests before shipping and watch them after put in service. Our records consulted at random show shipments aggregating **70,000 No. 7-B GENERATOR CALL TRANSMITTERS,** with none of this lot returned defective.

Let us put a perfect transmitter on your telephone. All Stromberg-Carlson telephones are equipped with No. 7 type Solid Back Transmitter.

Order No. 7-B for Generator Call Service—No. 7-A for Central Energy Service.

We solicit your orders for immediate requirements.

KELLOGG

TELEPHONE APPARATUS

ALL KELLOGG TELEPHONE PARTS

Are Made From the Best Grades of Material and Are Carefully Assembled by Skilled Workmen, Thus Making Everything High-Grade Throughout

For Central Battery or Magneto Use.

The tubular hard-rubber covered standard, with hollow brass shell, nickel plated base, is distinctively KELLOGG.

The transmitter hinges at top of standard, and there is mounted in base the hook switch and hard-rubber terminal block for receiver and desk stand cords.

The hook switch is of the toggle joint type, having a long motion of the springs, thus obtaining most excellent contacts with only a minimum motion of receiver hook.

All necessary parts are properly insulated, are easy of access and are made as nearly dust proof as possible.

THIS IS WHY

Digitized by Google

Ericsson Generator

The illustration shows our Standard 4-Bar Generator.

The magnets are made from our own steel, which is a later discovery than "Tungsten."

Instead of a cast iron field, pole pieces of pressed steel are employed. The sides are ground so as to bring the ends of the permanent magnets within a minimum distance of the armature center, securing a maximum efficiency by increased lines of force.

The construction of the generator is such that a three bar can be converted into a four bar or a four bar into a five bar generator.

An additional brush spring and a commutator may be put on any generator for pulsating currents.

The larger gear is made of 3-16 inch hard rolled sheet brass, not soft castings. Gears are ground together, insuring noiseless running.

AS AN INVESTMENT

there's nothing more safe, more sure, more profitable—in the telephone business—than the securities of an Independent telephone company operating our AUTOMATIC TELEPHONE SYSTEM—

BECAUSE it gives more service, better service, prompter service, more accurate service than a manual system (and also an absolutely secret service, which no manual system can give) and

BECAUSE it costs less to operate, less to maintain, less to enlarge than a manual system, or

TO SUM IT ALL UP, the AUTOMATIC TELEPHONE SYSTEM produces a better telephone service, commanding a higher price, at less cost than inferior service can be produced for by a manual system.

THAT IS THE REASON WHY the AUTOMATIC TELEPHONE SYSTEM makes the securities of the company using it safe, stable and profitable, and why it has been adopted by the Independent telephone companies in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.

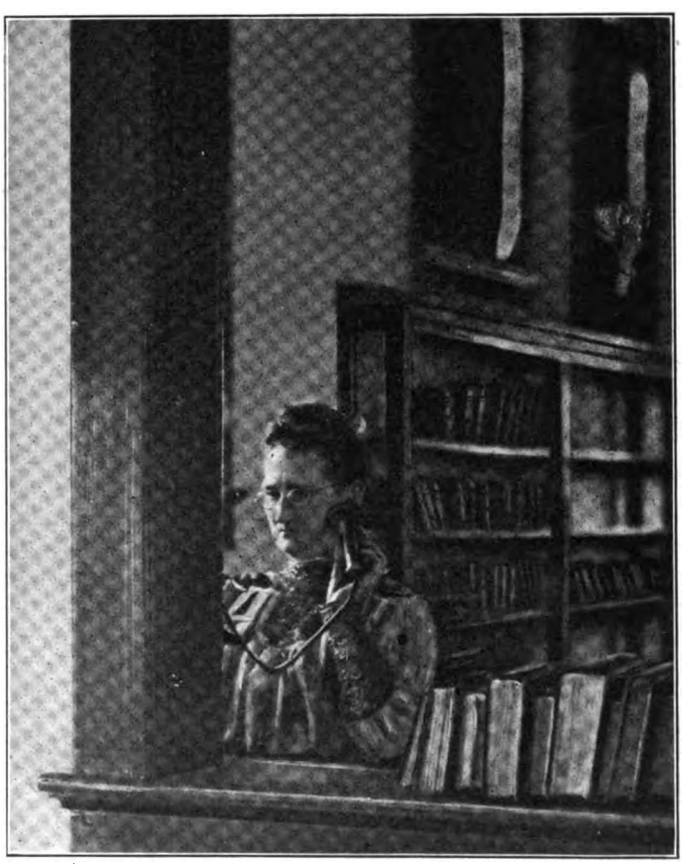
The Telephone in Library Extension Work

By Mrs. D. E. Allen.

HOW to make the books under her charge attain the fullest measure of usefulness, and serve the interests of their owners most constantly and easily, was one of the problems which the writer has had to solve. As librarian at the public library of Downs, Kansas, it was necessary to devise some means for putting such information as is contained in the books on the shelves at the disposal of the greatest number of those who could use this information. Although it seems to be a new idea, what could be more natural or simple than to use the telephone for this purpose? That is how the difficulties were overcome.

The people who are entitled to use the books in this library are widely scattered, some of them in the thickly settled part of the town, but a great many more living on farms in the surrounding country. Still, widely separated as these people are, they nearly all are telephone users. The lines form a network over this entire section. In the town there are about 225 telephone subscribers, and nearly 400 in the country, using rural lines, who can be connected with the instrument at the library by the operator at the central office.

At the present time, the plan of educating people to use the telephone for communicating with the library having been in operation for some months, there are perhaps an average of thirty requests per week for information by telephone. From this it is clear that the plan does not become burdensome to the librarian, but rather gives her that opportunity to extend her service which she requires in order to get the most hearty support from the people.



The Librarian at Downs, Kansas, Giving Information to a Rural Telephone Subscriber.

Naturally the communications over the lines may be divided into three classes. Farmers and business men call up to obtain information which they need at the moment, and which is most easily to be obtained from the books of the library. A few days ago, for example, a man said: "I have forgotten the number of pounds of wheat there are in a bushel; will you tell me how many?" Many queries along similar lines are made from day to day, Another example of reference to the library in the settlement of some business matter is revealed in the following incident: Answering the bell one day the writer found on the line a member of a school board in a rural district, anxious to know what encyclopedias were used in the library, and what, in the librarian's judgment, were the best. He was being interviewed at that moment by an agent, and wished to have advice which would help him to obtain the best books for his school.

As an aid to those who wish the best available references in educational work, the library telephone in our town has now become indispensable. Teachers and pupils in a country school very often need more information than can be obtained from the books they have in the schoolroom. When they telephone to the librarian she promptly looks up the facts in the books under her care, and tells them to the waiting teacher. Pupils who are required to prepare biographies and essays in their school work, and country educational clubs or debating societies find the telephone reaching the public library a most convenient means by which they may be assisted in any line of study. It is rare for a day to pass without the receipt of a call from some child for facts bearing on a school lesson, such as, "Will you give me some points on the minerals of Idaho?" or "Where was the fort called the Alamo, and how did it become noted?" Then there are the older people, who ask for information not only about a wide range of general subjects, but along literary lines. For example, the other day a person called by telephone to find who wrote the book, "Locusts and Wild Honey," and what else he has written. After the information had been secured by proper reference she was informed that the book was written by John Burroughs, who is also the author of "Signs and Seasons," "Birds and Poets," "Wake Robin," etc.

Standard reference books, as is customary in all libraries, must not be taken from the building. In cases of debates rivalry between the opposing sides is keen, and calls for statements from the standard works are made in large numbers.

In the routine of the library the telephone is a great help

Digitized by Google

to the librarian and the book user. Rules state that loaned books may be kept two weeks, and at the end of that time must either be renewed or returned. Renewal by telephone is allowed, and this privilege is very much appreciated by the people in the country, and even by those in the town if it happens to be bad weather, or if for any reason it is inconvenient to get to the library. Every day there are calls for renewals in this manner. Frequently a book user tells the librarian that a book has been taken by a child, and a certain other book is desired. If that book is not in suggestions may be made over the line and another chosen which will be thoroughly satisfactory.

MONTANA LEGISLATURE FORCES RAILROADS TO STOP DISCRIMINATING AGAINST INDEPENDENT TELEPHONE COMPANIES.

MONTANA has put herself in line with the states which are recognizing the necessity of giving Independent telephone companies an opportunity to install their instruments in railway stations. House bill No. 291, by which this privilege has been secured, reads as follows:

"An act to require railroad, telegraph and express companies doing business in the State of Montana to permit the installation of telephones in their offices, and to answer calls made over such telephone connection during business hours, and to provide a penalty for the violation of the provisions of this act."

BE IT ENACTED BY THE LEGISLATIVE ASSEMBLY OF THE STATE OF MONTANA:

SECTION 1. It is hereby made the duty of every railroad, telegraph and express company doing business in the State of Montana to install or allow to be installed in its ticket office, public office and freight office, in all cities and town in this State where there are, at the time, one or more public telephone exchanges, a telephone of each public telephone exchange in said city or town, and to maintain in each of said offices direct telephone connection with each of said exchanges; but nothing herein contained shall be construed to require said railroads, telegraph or express company to build a telephone line, it being intended to require such company or companies to install or allow to be installed a telephone in each of its offices, where it can be obtained by them as they may be obtained for other business offices in the same vicinity. Each railroad, telegraph and express company shall cause to be promptly answered all calls made over such telephone connection during business hours; provided, however, that such railroad, telegraph and express companies shall not, in the absence of an agreement to that effect, be required to bear the expenses incidental to the installation of said telephones, or to any charges for the use thereof. Over such telephone connection such railroad, telegraph or express company shall cause prompt and correct replies to be made to all reasonable and proper inquiries over such connection during business hours concerning the passenger, freight or telegraph service of such railroad, telegraph or express company.

Section 2. The term "business hours" as used in this act shall be construed to mean such times as the office or depot of such railroad, telegraph or express company may be open, with an officer or agent of such railroad, telegraph or express company in charge for the transacting of business.

Section 3. Any railroad, telegraph or express company failing or refusing to comply with the provisions of this act, after its passage and approval by the Governor, shall be deemed guilty of a misdemeanor.

E. W. KING.
Speaker of the House.
EDWIN L. NORRIS,
President of the Senate.

Approved March 9, 1907.
J. K. TOOLE, Governor.
Filed March 9, 1907, at 11:35 A. M.
A. N. YODER, Secretary of State.

Thaddeus S. Lane, well known to Independent telephone men throughout the country, has recently been giving much of his time to the development of the Montana Independent Telephone Co., and writes from its headquarters at Butte as follows:

"Newly organized Independent companies are greatly handicapped, at the beginning of their operations, by the refusal of railroad, telegraph and express companies to permit the installation of telephones. This is particularly true in this State, where many important towns have only one railroad.

"We have had an especially aggravating instance of this at Billings, Mont., where we have nearly 1,000 telephones in operation as against about 150 Bell instruments. At least one-half of the latter are retained simply for the purpose of securing telephonic communication with the railroad and express offices, which are controlled by the same outfit. We were unable to get permission to install free service for the railroad company. In reply to our numerous applications, and petitions signed by citizens, the railroad company gave only one answer, namely, that it did not care to encourage competition in telephone service, as it eventually made annoyance and greater expense.

At the last session of the legislature there was passed, due to our representations of the desirability of such action, a bill requiring railroad, telegraph and express companies to permit the installation of telephones, a copy of which is herewith enclosed. Although this bill does not read exactly as we desire, we believe that it is a piece of legislation in the right direction, and is of great benefit to the Independent telephone interests in this State.

"Many railroad companies still refuse to permit the installation of Independent telephone service, claiming to have entered into an exclusive agreement with the Bell company. As a direct result of this piece of legislation we have recently received orders to install our telephone service for railroad companies at various points in this State, including Billings.

"We send this to you, thinking that it may be of some interest to Independent telephone operators in other states."

A measure having a similar effect was passed some time ago in Virginia, and the Vermont legislature, after hearing the representations of the Independent telephone association of that State, has taken appropriate action. Independent telephone associations in other States should prepare to take advantage of these precedents.

NEWLY MADE SUB-LICENSEE COMPANY IN TROUBLE AT KOKOMO, IND.

THE Citizens' Telephone Company, at Kokomo, Ind., is reported to have recently violated its franchise by permitting the Central Union (Bell) Company to connect its long distance wire with the local switchboard. This act was not only a violation of the provisions of the franchise which had been granted to the company, but was also against the wishes of the greater part of its subscribers, who are for various reasons said to be opposed to the idea of using Bell lines.

The company, since forming its new connections, is apparently afraid that all of its subscribers will depart, for it has adopted a new rule requiring applicants for telephones to sign an application and give a bond to pay for the service for one year. Of course, the result has been to make still more bitter the opposition to the company. It has now assumed an official quality, as the city attorney has decided that the company's charter gives it no right to take such action, and the matter will probably be tested in the courts.

PORT BYRON, N. Y., SUPPORTS INDEPENDENTS DESPITE FREE BELL SERVICE.

TWO years ago, in order to secure telephone service, a number of prominent people of Port Byron, N. Y., met and organized a telephone company. Although before this time it is said to have been impossible for many people to secure a Bell telephone on reasonable terms, that organization immediately sent a large force of men to rebuild its small system at the town, and sent canvassers to offer telephones free to all comers.

About seventy instruments were installed by them under these terms, and it is said that service has been furnished without cost to the users up to a few weeks ago. The Bell company at this time decided that it was sufficiently well established to enable it to charge for its service, but as soon as it did so most of the instruments were removed. The Independent company in the meantime has been growing rapidly on a substantial basis, having very nearly two hundred and fifty instruments in service, and new subscribers are continually being added to its system.

COLONEL J. D. POWERS MEETS WITH ACCIDENT.

COLONEL JOSHUA D. POWERS, of Louisville, who is well known to telephone men throughout the entire country, and was the genial toastmaster at the last Independent convention, at Chicago, had the misfortune, on April 16, to break his ankle. As he stepped to the pavement on leaving a building his foot struck a quantity of fine sand, twisting his left ankle and breaking the bones on both sides. Although the bones were immediately set, the accident will, of course, keep him confined to his home for several weeks.

The Sterilization and Preservation of Poles*

By H. P. Folsom.

IN maintaining telephone, telegraph, electric light and interurban railway systems, one of the greatest problems that confronts the management is the inevitable depreciation of the outside plant. One of the largest items of this depreciation account is that caused by the rotting of poles.

The importance of this subject will be appreciated when we say that there are 250,000 miles of telegraph and about 500,000 miles of telephone pole lines in the United States, making a total of 750,000 miles. It is safe to say that these lines average thirty-seven poles per mile, making on this basis 27,750,000 poles. The poles used for electric railroads and electric light plants will make an addition of 5,000,000, or a grand total of 32,750,000 poles. This is in accordance with the government report of 1902. It is estimated that there were over 40,000,000 poles in use in the United States for supporting electric wires at that time. The value of these poles placed in the ground ready for use will average from five to seven dollars each, or about $200,000,000. This vast amount of property is exposed to the weather and is constantly decaying; this decay goes on day and night and is as certain to cut a pole down as death is certain to overtake a man and cut him down.

H. P. Folsom.

It is evident that if some means can be found to destroy at the soil line the germs which attack the poles, and at the same time protect the pole from the attack of those which remain in the surrounding soil, at a reasonable cost, the great problem of the depreciation of telegraph and telephone poles is solved. If the life of the pole from the surface of the ground up and down a few inches can be prolonged ten or twelve years it will add millions of dollars to the value of our telephone plants, and the stocks and bonds of all the companies that use poles will be vastly increased in value.

The average life of a white cedar pole is said to be from twelve to fifteen years; it varies, however, owing to its condition when placed in the ground and the nature of the soil and climate. All poles and posts rot off at or near the soil line. The decayed portion extends a few inches above, and about three or four inches below the soil line, the depth below being governed largely by the nature of the soil. The portion of the pole from the soil line to the top will last many years, possibly three times as long as the portion that goes into the ground.

Cause of the Decay at the Soil Line.

It is only of recent years that the true cause of the decay has been discovered, although there have been experiments made for the past forty years to preserve poles.

It would be interesting, if time permitted, to follow the many experiments in Europe and America in this line of investigation. Indeed our own many failures and successes in the past six or seven years would not be uninteresting. In many ways we have been fortunate. We have had the benefit of the experiments of the most learned scientists that have preceded us in this line of investigation; their mistakes as well as their successes have aided us. There is no lack of literature on the subject of preserving timber, covering the past seventy-five years. Since the germ theory of disease was recognized as true, the subject has engaged the attention of some of the most accomplished bacteriologists and microscopists in this country and in Europe. The United States Department of Forestry has in the past two years been experimenting with the co-operation of the Western Union Telegraph Company, in the preservation of telegraph poles. The result of their work has not been made public on account of the time engaged being so short. The great trouble with most of the work done is that the experimenters have been endeavoring to sterilize the pole before placing it in the ground; our endeavor has been to sterilize and protect the poles already in the ground.

It has been proved beyond question that the decay which takes place at, or near the soil line of the post or pole, is caused primarily by living organisms, namely, bacteria or fungi, and in some rare instances by insects. Bacteria and fungi are both low forms of life; they multiply when once they attack the pole with great rapidity, and since their action on the fiber of the wood is practically the same, they will be considered in this paper together. They attack either dead or living timber; on dead timber they attack the walls of the cells and the result is the familiar decay or rot under consideration.

Conditions Necessary for the Growth of the Fungi and Bacteria.

There are two conditions necessary for the existence and rapid growth of those living germs of destruction.

First, there must be a certain amount of dampness or water.

Second, there must be a certain amount of heat, and some scientists claim a certain amount of oxygen. This they claim is shown by the fact that bacteria and fungi do not ordinarily affect the pole more than a few inches below the soil line, unless the soil surrounding is very loose or porous. It has been observed that a line of poles running through a pasture field where there is grass growing, will be more quickly attacked than in any other situation. Again, a line of poles situated on the north side of a hill will be more quickly attacked than on the south side, provided the soil is loose and porous. A pole under water will not be attacked by fungi and bacteria, neither will it be attacked when surrounded by soil containing certain chemicals. A few years ago it was thought by telegraph and telephone companies that, if the dirt was heaped up around the pole, thus leaving a certain amount of drainage away from it, no decay would take place at the soil line. Experience has shown that this was a mistake; the pole was attacked just the same, only a little higher.

It will be observed in passing, that the great enemy of the telephone pole is the same that attacks the millions of railroad ties in use. The conditions surrounding a railroad tie are more favorable for the rapid growth of the bacteria and fungi than in the case of a pole. They lie flat on the ground, constantly absorb moisture, and being exposed to the rays of the sun, have the two necessary conditions for rapid growth. The problem of protecting and sterilizing railroad ties is a much more difficult one than we have to contend with in the case of telephone poles, although it is generally supposed by experimenters that this is not the case.

Realizing the great importance of this subject we began our experiments with antiseptics about six or seven years ago, although some of our experiments in the preservation of posts and poles have extended over a period of nearly twenty years. We directed our attention to poles that were in the ground and that were already infected. We believed if it were possible to

* Abstract from a Paper read at the Convention of the Ohio Independent Telephone Association.

Digitized by Google

save the life of a pole which had already been attacked and was partially rotted off, it would be a comparatively easy task to sterilize and protect a pole which had lately been placed in the ground.

We believe we have found a means to sterilize poles in the ground that is practicable and certain, and that, too, at a cost which is reasonable and much less that the natural depreciation will amount to.

The Process of Sterilization.

We cannot better explain our process, and at the same time give you the results or our experience, than by relating some particular instances of our experiments. We were very desirous of making a thorough test; one that would conclusively demonstrate the efficiency of the process. It having been demonstrated by a long line of experiments that the cause of decay at the ground line was a bacteria or fungus growth, induced by a certain amount of moisture and heat from the sun, it was obvious that in order to sterilize and save the life of the pole, we must use an antiseptic that would penetrate the pores of the wood. We selected a class of poles that had been in the ground for about eight years and which were thoroughly infected with germs; indeed some of the poles upon which we experimented were over half rotted through, and could not have lasted two years under the most favorable conditions; they were so weak that they would not have survived a severe storm at all. We dug down around the pole about 18 inches, and with a pointed instrument scraped out and away all the rotted wood, we then applied our antiseptic chemicals in a plastic form with a trowel, filling all the holes and depressions even with the surface of the pole. We next placed around the pole an especially constructed asbestos jacket that would resist the action of the elements, such as rain, snow, freezing, and thawing. We filled in between the jacket and the pole antiseptic material in a powdered form, to the top of the jacket. We allowed the top of the jacket in some instances to remain open so that it received all the rain and snow that fell and which might run down the pole. In others we placed a cap over the top of the jacket. We were careful in mixing our antiseptics to use none that would cause the pole to become brittle and thus weaken it. We found that in all instances after a period of over six years, our antiseptics had completely sterilized the poles where applied and the decay was entirely arrested. In fact the poles were in as good condition as when the treatment was first applied. We carried our experiments further and treated a class of poles that had not been in the ground more than two or three years; the surface indications showed only slight infection, but the sappy portion had begun to scale and the cracks exhibiting unmistakable signs of decay. We did not attempt to clean off the decayed portion of this class of poles, but treated them by placing the jacket around the pole and depositing between it and the jacket our antiseptics and then sealed and fastened the collar above referred to. The jacket on these poles was about 18 inches wide, extending below the ground about 14 inches, and above the ground about 4 inches. Upon examination of this class of poles six years after treatment they were completely sterilized free from the effects of the bacteria and fungi. No signs of living fungi could be discovered under a powerful microscope.

Cost of Sterilizing Poles and the Profits Therefrom.

We are fully aware that the success of this process depends very largely upon the question of expense.

We have made some figures based upon our experiments which show that the cost is within the reach of all companies and can easily be paid out of the depreciation account and still leave a handsome surplus.

Suppose we take a plant of 5,000 poles costing $5.00 each, in the ground fully equipped. Their original cost would be	$25,000
At the end of 12 years they will have to be renewed at a cost of	25,000
Counting interest for 12 years on the last $25,000 equals	18,000
Making a total cost for 24 years of	$68,000

Suppose we take the same plant and apply the treatment.

Original cost of 5,000	$25,000
Cost of sterilizing after they have been in the ground two years $1.25 each (and it can be done for less)	6,250
Interest on this amount for 22 years	8,250
Making a total cost for 24 years	$39,500
Cost for 24 years without treatment	68,000
Cost for 24 years with treatment	39,500
Profit in favor of treatment	$28,500

It will be perceived that if the pole is preserved intact, with full strength for ten or twelve years by means of the jacket and chemicals, and it is removed or entirely gone, at the end of that time, the pole will be in the same condition to resist the fungi that it was when first treated, and will have its original strength and life.

Again in our calculations we have not taken into account the increased amount of trouble that always accompanies the use of old poles the last few years of their lives. This item of the maintenance account always increases as the poles grow older and weaker, and should be placed on the credit side, where the process is used. Then again, in all human probability, poles will be at least twenty-five per cent. higher in value 12 years from this time. If that be the case, the cost of the new poles when they have to be renewed would be $6,250 more, and the interest on this increased amount for 12 years would be $4,500, making $10,750 more to be added to the profits of sterilizing, or a total of $40,375 in 24 years.

The Annual Convention of Kentucky Independents

WHEN President M. B. Overly, of the Kentucky Independent Telephone Association, called the second annual meeting to order at 10 o'clock in the morning of Tuesday, April 16, 1907, he faced 138 delegates and representatives of Independent telephone companies in the State of Kentucky. The beautiful red room of the Seelbach Hotel was full of enthusiastic workers in the field. This banquet hall had been artistically decorated, before the arrival of the delegates of the telephone companies, with mottos, shields, maps and flags, while in the center hung a large lantern with the Independent colors showing clearly to every one in attendance.

Kentucky is divided into four districts, and in these four districts are 75 operating Independent companies. Thirty-five of these companies were represented at the annual meeting, practically every important company in the State having sent delegates.

As soon as the opening address by the President had been made, the Convention got down to real work. The Vice-President of each district presented a report showing the conditions in his territory, together with the growth during the past year. It developed, much to the surprise of every one present, that in this State were 41,640 Independent telephones against 42,052 Bell telephones. When these figures were announced and the fact was pointed out that the two interests were on practically an even footing, even though the cities of Covington and Newport are entirely undeveloped by the Independents, it called forth a round of applause that should have been heard by the co-workers all over the State.

Digitized by Google

Routine matters filled up the time until noon, but when adjournment was taken for luncheon everything had been cleared away ready for the exchange of experiences and the instructive remarks that were on the program for the afternoon session.

When the convention re-assembled at 2 o'clock, it was addressed by Mr. George S. Shanklin, President of the Fayette Home Telephone Company, of Lexington, Ky. He spoke about Independent telephone securities in a way that riveted the attention of every one present. He told of the soundness of Independent telephone companies everywhere and the investigations that had been made of such companies by the two telegraph systems of the United States. He prophesied that the day would come when, for economical reasons, the Independent movement would absorb one system with its thousands of miles of pole lines already in existence, that could be quickly converted into long distance lines. He also called attention to the bogy of deterioration in telephone plants by comparing in detail the deterioration of telephone equipment and the equipment of traction lines. Mr. Shanklin presented facts and figures that showed that the deterioration in traction properties was nearly twice as great as that of the modern telephone plant.

A recital of conditions in Texas was given by J. L. Nunn, an ex-Kentuckian, now located at Amarillo in the Lone Star State. He referred humorously to their troubles of a technical nature with which he claimed to be unacquainted personally, but dwelt seriously upon the troubles of a financial nature that he was experiencing in meeting the tremendous demands for increased service, for the reason that the development was growing away beyond anything he had ever been connected with in a business way.

Various delegates from different parts of Kentucky followed with tales of experiences, crowned universally with success, and showing that the Independent movement was not only strongly entrenched, but a fighting organization of the highest grade.

The fighting side of the telephone movement was graphically given by R. E. Cooper, of Hopkinsville, who with his associates, has just brought to a successful close a struggle with the Cumberland Telephone & Telegraph Company in the adjoining State of Tennessee and primarily in the city of Nashville. When he closed with the modest statement that Tennessee has at least been freed, and that the Independents could now build a telephone plant in any town or city in the State, the Convention went wild.

The enthusiasm reached a climax when W. B. Stanfield, of Mayfield, Ky., told of the battles that had been fought by him and his associates in the Western part of Kentucky against the methods of the opposition.

The convention was brought to a close in the late afternoon after an election of officers for the ensuing year had taken place, which resulted in the choice of M. B. Overly, of Louisville, as president; W. G. Turpin, of Henderson, as secretary, and J. W. Chambers, of Winchester, as treasurer.

All persons were invited to a banquet to be held in the evening as guests of the Louisville Home Telephone Company and Central Home Telephone Company. When 8 o'clock came around, about 150 guests were seated. Toastmaster Donald McDonald, in his happiest vein, called upon various men here and there throughout the banquet room for appropriate remarks, which kept the assemblage in an uproar until about 11 o'clock.

In addition to the delegates from the various companies belonging to the Association, representatives of telephone companies located in Alabama, Tennessee, Illinois and Indiana, which are closely connected by business and long distance ties with the Kentucky companies, were on hand. Representatives of associations in other States were on hand in the persons of Jesse W. Weick, of Indiana, and Albert Parlett, President of the Virginia Independent Telephone Association.

About fifteen of the country's telephone manufacturers sent their officers or general salesmen, who became more thoroughly acquainted with their Kentucky patrons, and participated in the royal hospitalities of the Louisville companies.

At the conclusion of the banquet on Tuesday night, the opinion was expressed everywhere that the Kentucky Independent Telephone Association meeting had been successful from every view point.

Rural Party Line Ringing Codes*

HENRY GRANT NEWELL, of Orwell, Pa., an engineer who is must interested in the subject of rural telephony, contributes the following letter, which shows how his ringing code is built up, and gives a few suggestions about operation.

"Five or six years ago the writer devised a numeral ringing code which, in extensive use by the People's Consolidated Telephone System, has proven a great success, and decidedly superior to the old dot-and-dash code. This numeral code is easy to learn, easy to ring, easy to read, easy to remember. Old people and children, even, learn it in a few minutes and memorize the rings of a whole line almost as readily.

"From our directory is quoted the following:

EXPLANATION OF NEWELL NUMERAL CODE.

5 means a long ring—Four or Five brisk turns.
1 means a short ring—One complete turn—Ring off.
1, 2, 3 and 4, the number of shorts—Leave crank at low point.

For example we have the following rings:

15	51	151	35	255	1515
·—	—·	·—·	···—	··——	·—·—

the latter known as "fifteen-fifteen." 1551 is also equivalent in muscular exertion in ringing 255 or 552. No doubles are recognized, and as in all the best modern practice, no letters are used. Such antiquated symbols as: ——··—, lssl, or l o o l, and called "one long, two short and a long" are extremely crude, clumsy, confusing, and altogether out of date. We say 525 and that is the end of it.

"Long rings, 5, 55, 555, are reserved for switching stations, as many rural lines have two terminals and others three. If there will never be but one switch to call, 55 may be used for a party who is more or less deaf; 51, 52, 552, are good rings for old people, having the long ring first. But the use of the long ring should be restricted as far as possible. This is borne in mind in making up the numbers, employing the simplest and easiest combinations first.

"Here are some desirable rings in the order of easy ringing, desirability, and special use, omitting such rings as 5551 or 55155.

Only one long ring.	1 ·	Ring off only.
	2 · ·	Seldom used. Both parties often ring off.
	3, 4	O. K. Fine rings.
	5, 55, 555	Reserved for switching stations, doctor, mill, store, etc.
	15, 51,	
	25, 52, 151,	
	35, 53, 251, 152,	
	45, 54, 351, 252 · ·	All easy, excellent. 19 rings so far.
	451, 154, 253, 352 · ·	Not as desirable.
Only two long rings.	551, 155, 515 ·	These are preferable. Very good.
	552, 255, 525, 1551, 5151, 1515 ·	All good rings.
	553, 355, 535, 2551	Next best.
	554, 455, 545, 2525	Forty rings.
	353, 454, etc.	If needed (!).

"Spaced rings: 2-2-2, 123, 313, 333, etc., as 22 (22· · ·) may be used (?) for general calls, directors, committees, etc.

"None of these are to be adhered to in strict order, for a line of twenty need not use such rings as 451, 154, 352, etc., but use instead the popular rings 515, 155, 551, etc. In a mill we used 5553 for obvious reasons.

*Continued from previous issues.

Digitized by Google

"It is evident that the figure 7, or even 6, 8, or 9 may represent the long ring permitting the use of five short rings singly and in combinations, but this is very undesirable and unnecessary. Therefore, 5 is the best figure to use, and after four or five years' trial we see no improvement to be made in The Newell Numeral Code.

"As a matter of history it may be said that the writer, at an earlier date devised a code based partly on Roman numerals, as: — for V or 5. — - stood for VI (6), etc., up to ten which was ——. 12 was — — - -, and it was dropped as "no good."

"So were spaced rings as - - - - for 22, etc.

"As to just what is really best for general calls, fire alarm or emergency ring, we are in doubt. We find the continuous ring very convenient for testing out a partial or intermittent short circuit as in a swinging cross or faulty drop, and sometimes an extra long is used to awaken central.

"Someone has suggested six short rings as a general or emergency call. Is there anything better? Let us hear from the brethren.

"In using the numeral code, at once and forever drop all thought of "longs and shorts." It is a nuisance. Watch the rings for a day or two and read them, that is, call them *by number only*. In a few minutes the rings of a whole line are learned. Uniform ringing, too, is a great success with us. From the first, a short ring is always one complete turn only. Leaving the crank on the low point is not only handiest, but always insures a complete turn.

"We find that four or five complete turns for a long ring is best; three turns are too few and from eight to twenty turns are abominable. Fortunately few subscribers are so vigorous as to make cautioning on this point necessary.

"To give simple and exact instructions, in a tactful way—how to ring, how to talk, etc., are duties imposed on the installer. It is easiest and best for the new subscriber to learn just the right way at the start, as bad habits are seldom overcome if once firmly fixed.

"Best of all are simple and attractive instruction cards put out by the manager, and readers of the JOURNAL should send in samples.

"At the very start, also, however small the system, operators and others should insist what 'Number please,' else there is always a hitch in the service. Too often 'I want Bill Smith' is the call. Now if Bill were the particular Smith wanted, the proper form would be to give simply Orwell 52, Number 5, printed in the directory, Smith, Bill, 52 No. 5.

"Our directory is as clear and simple as the code. We find, as others have, that it is best to give subscribers their full names, as: John I. and Jas. E. Eastman, and it is valuable also to include the occupation and post office address.

"If the lines are numbered, the following form is correct:

LINE.	NUMBER.	SUBSCRIBER.	OCCUPATION, ETC.	POST OFFICE.
Line 12	No. 155	Allen, Jas H.	Gen. Mdse.	Apex, Pa.
Line 8	No. 35	Atkins, Thos.	Pension Agt.	Cebu, N. Y.
L 21	No. 515	Culver, Asa.	Ginseng Gardens	Athens, Pa.
10	No. 151	King, J. Thos.	Pedigree Holsteins	R16, Rome, Pa.

"If the lines are named as are sections of cities, use this form:

LINE.	NUMBER.	SUBSCRIBER.	OCCUPATION, ETC.	POST OFFICE.
Rome	No. 155	Baker, Jas. J.	Auto Repairs	Rome, Pa.
Rome	No. 4	Quick, P. D.	Express Agt.	Rome, Pa.
Rome	No. 552	Thompson Bros.	Millers	Rome, Pa.
Pike 1	No. 25	Baxter, Wm. T.	Farmer	R7, Athens, Pa.
Pike 2	No. 152	Bender, Sam.	Teamster	Athens, Pa.
Rush	No. 3	Compton, Ed. J.	Veterinarian	Lawton, Pa.

"Lastly, the very best practice for rural lines in all the details of construction, operating and management, should be developed to a finish and the highest standards rigorously insisted upon by connecting lines.

"THE AMERICAN TELEPHONE JOURNAL and its readers can do a great work for the Independent interests in this respect. Let us send in our experiences, offer suggestions, hold discussions, and get together generally in its pages. The Editor is willing, and it will help us all to more quickly and easily solve the problems which perplex us."

OFFICIAL BULLETIN NUMBER TEN OF THE INTERNATIONAL INDEPENDENT TELEPHONE ASSOCIATION.

SECOND SERIES.

ROCHESTER SITUATION—A DISTINCT VICTORY FOR THE INDEPENDENTS.

Following the filing of suit brought by the Attorney General of New York State, upon evidence supplied by officers and members of the International Independent Telephone Association, to prevent the Rochester merger, the American Telephone & Telegraph Company (Bell) has withdrawn its proposition for the purchase of the United States Independent Telephone Company of Rochester and its subsidiary properties. A reorganization committee is being appointed by those in charge of the U. S. I. affairs.

THE CONVENTION.

It will be the greatest and most important gathering of telephone men the world has ever known. Everything indicates that even the record-breaking attendance of last year will be surpassed, and the interest already manifested everywhere in the subjects to be considered could scarcely be greater.

Attend yourself; see that your companies and your State are well represented—and impress upon your associates the necessity of doing likewise.

Bear in mind that this is *your* convention.

REDUCED RATES.

Rate of a fare and one-third on the certificate plan has been granted by the lines of the Western Passenger Association and its affiliated organizations, covering the territory west of the Mississippi River, exclusive of the Pacific coast, but including the greater part of Illinois. Be sure to secure certificates when purchasing tickets. The lines of the Trans-Continental Passenger Association will have a special summer rate in effect from all Pacific coast points to Chicago. In the Eastern and Central States unlimited round trip tickets can be bought at a flat rate of 2 cents per mile, making the fare a little less than under the certificate plan.

PROGRAM.

The Advisory Board, consisting of the presidents of affiliated associations, will meet at the Auditorium Hotel on June 3, the day before the convention opens, at 10:30 A. M. The committees will also meet at the same time and place.

The convention proper will be called to order June 4 at 2:30 P. M. The morning and afternoon sessions on the following days will be from 10:00 A. M. to 12:30 P. M., and 2:00 P. M. to 4:30 P. M., respectively.

The program will be of unusual interest. It will include brief spicy papers and talks on the important issues, of which there is no lack this year. Due recognition will be given "Compulsory Interconnection," "Bell Overtures," "Long Distance Possibilities," "High Finance," and the various problems met with in the construction, operating, financial and business ends of the industry. Brevity will be the keynote in the formal proceedings, so that all may have an opportunity in the discussions. The Question Box will be a feature of each session.

You simply cannot afford to stay away *this* year.

Complete program will accompany the next Bulletin, which will be issued about this time next month.

INTERNATIONAL SCHEDULE OF MEETINGS.

It is planned to have a representative of the International Association attend all conventions of affiliated associations. To do this, it will be necessary to arrange a schedule of meetings without conflicting dates. It has been suggested that the schedule begin with the Southern States in January, the various States following in the most convenient geographical order, at least ten days apart.

The associations are requested to advise with the International concerning this matter before fixing dates for meetings after the Chicago convention.

HONORARY MEMBERS.

The list of honorary members is growing, but not as

Digitized by Google

rapidly as it should. It is an honor that deserves to be looked upon with due respect, as no person can be elected to honorary membership without a vote of the executive committee, and then he will be elected to membership only upon the recommendation of three other honorary members.

MAP DEPARTMENT.

Did you get our letter asking for map data? Hurry the answer in. We want it for the convention display.

A Low-Priced Circle Top for Distribution

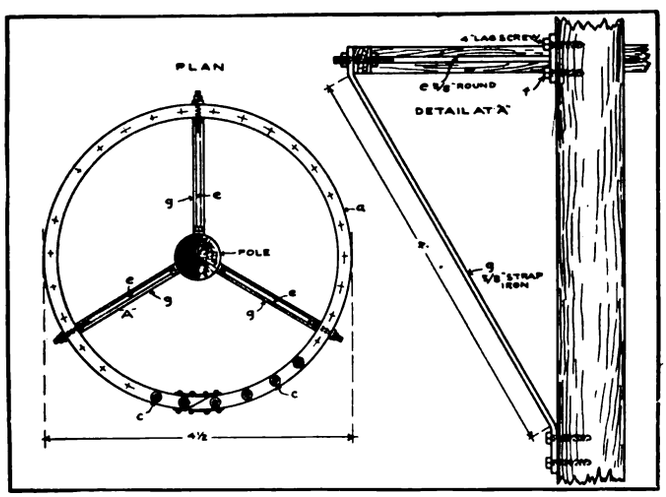
By R. B. Fegan, Manager Ithaca Telephone Company.

A VERY material saving over the prices frequently paid for circle tops for distributing in business and closely settled residential districts can be made by the use of material available at low cost in any city or town of moderate size. As against a cost of, perhaps, $14 to $20 apiece complete, which is frequently paid for circle tops, the writer has succeeded in building them for the comparatively small sum of $6 as the total cost for a 25-pair circle. The idea is to simply use for supporting the insulators which carry the wires wooden rims, such as are used on truck wagons. The material used in connection with these rims can be secured easily and at a low price from sources of supply available to everyone.

Two semi-circular sections are placed together and bolted firmly in position through quarter-inch iron plates, *b*, forming a circle 4½ feet in diameter. In place of the cross-arm pins, which in many cases have hitherto been used in circle tops, are substituted No. 4 knobs, *c*, arranged in pairs, one below the supporting circle and one immediately above, the two being held in place by a carriage bolt, *d*, passed through them both and the rim. The head of the bolt is placed at the top, and the lower knob is fastened firmly by the carriage bolt and a nut and washer at the bottom.

The head of the bolt sinks below the surface of the upper knob about one-eighth of an inch, and when in position is thoroughly covered with stove clay. This insulating arrangement does away with all electrical leakage which might occur from the wire on the top knob to that on the lower one if no such precaution were taken.

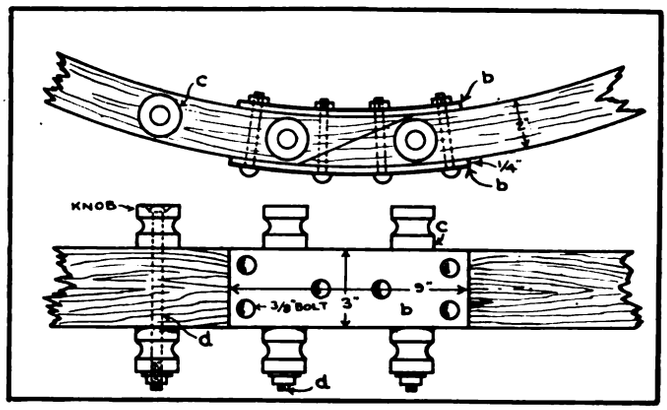
To fasten the circle to the pole a special form of brace is constructed, as shown in the drawing. In the first place three tee braces, *e*, run from the pole to the circle, each one of these being fastened to the pole by two 4-inch lag screws. In order to compensate for the varying sizes of pole tops the circle is fastened between two nuts, thus holding it securely from both sides, but giving a chance for adjustment. Between the outer nut and the wooden rim is fastened another brace of strap iron, which is



Plan and Half Sectional Views of Home-made Distributing Circle.

punched so that the horizontal brace can pass through it. This brace runs down diagonally to the pole, and is fastened by lag bolts. This method of fastening gives a circle top which is very securely and rigidly attached to the pole top. Should it be desired to place more than one circle on a pole, all that is necessary is to take three cross-arm braces and bolt them to the circles, giving a tier of circles one above the other about twenty inches apart.

All the work necessary to manufacture these circle tops can be done by almost any telephone man. He has only to purchase half rims of a wagon manufacturer, and have the connecting plates, rods and braces made by a local blacksmith. In small



Detail View, Showing Method of Splicing the Two Half-Rims and Fastening Knobs.

quantities the total cost is about $6, but if a larger number of them are made at one time an even lower figure may be obtained. The writer, although he has used this circle top in the city of Ithaca, N. Y., with good success, has not obtained a patent, and does not intend to, but offers these suggestions freely to managers of Independent companies throughout the country.

INDIANA INDEPENDENTS EXPRESS CONFIDENCE IN THEIR STRENGTH AT MUNCIE DISTRICT MEETING.

THAT the Independent telephone outlook in Indiana was never better is evidenced by the unusually large attendance at the Fifth District meeting of the Indiana Telephone Association held at Muncie on April 17. The meeting was called to order by A. J. Brown, of Winchester, president of the district branch, who congratulated the association over the large attendance. After the reading of the minutes and disposing of routine business, a three minute report was had from the representatives of every one of the twenty-three companies in the district. Never before were more encouraging reports made to a district convention, every representative reporting a large increase in the number of subscribers and stating that his plant is now taxed to its full capacity. Many members are now face to face with the necessity of enlarging their exchanges, extending their lines and installing additional equipment.

It was freely predicted that more money would be expended this year for improvements, extensions and betterments than during any previous year. The reports indicate that a high grade of service is being given, and patrons are well satisfied, giving their hearty support to the companies in nearly every instance where it is required. The members of the association are now very much interested in the development of toll business.

Delegates to the state convention were selected and election of officers held. A. J. Brown, of Winchester, and W. O. Miller, of Fairmount, were re-elected president and secretary, respectively.

THE EDITOR'S PAGE

THE TELEPHONE AND THE PUBLIC LIBRARY.

NOWADAYS we hear a great deal about library extension work. Societies have been organized to aid in systematizing library work, and increasing the efficiency of library management, so that a wide number of lines of thought may be covered economically. This seems to be the main idea in the minds of those who speak of library extension, and the one which is emphasized in the various well developed schools which have been formed for training librarians. It has remained, however, for the librarian of a comparatively small town, namely, Downs, Kansas, to apply in a modified way the principles which form the foundation of what are generally admitted to be the most successful methods of so-called university extension work to her own local situation, and the immediate and practical success she has achieved shows the merit of her idea. Briefly stated, it consists simply in making all the information centered in the books under her care instantly available to the most distant person, in the town which supports the library, by aid of the telephone. This seems to be the one step needed to complete and make thoroughly practical the various plans for extending the usefulness of the library to its utmost limits. It makes it equally useful to the person who lives a few steps from its door and to the dweller on a remote farm.

Anecdotes which show the daily working and emphasize the worth of this association of the library and the telephone system are given in Mrs. Allen's article on another page of this issue. Her statement will put the matter clearly before managers of telephone systems throughout the country, and give them a suggestion which may make it possible for them to aid not only the business and social, but also the educational interests of the communities in which they live. In urging this advantage of telephone communication they will find still another means of strengthening the hold of their systems on the communities they serve. When the telephone is placed in every library, and people are taught to use it properly, we shall have gone one step farther toward the ideal of a telephone in every home, and in every public building and business establishment in the country.

A NOVEL FORM OF RETALIATION.

TELEPHONE subscribers usually keep a sharp lookout for any excuse to call for a discount on their bills. It has remained for the Bell company operating in Seattle to develop a situation which is especially interesting on account of its novelty, and amusing by reason of the unique way in which the tables were turned on the company.

It appears from the reports received from local sources of information that the company, which is hard pressed by a vigorous Independent opponent, has been diligently searching out plans for reducing expenses. When attention was turned to the operating department some ingenious individual found a loophole for gaining a few dollars by reducing the amount paid to the operators during the month of February. As they are paid on a monthly basis, and February is a short month, what could be simpler, or more just, than to reduce the wages in proportion to the smaller number of days in that month? So he reasoned, and so the company was convinced, and acted in accordance with its convictions. The wages were cut.

Perhaps no one knows just how the agitation started, but when the knowledge of this intelligent plan got around to the subscribers there was trouble in the air. They, too, pay on a monthly basis, and needed only to have the shortness of the month of February called to their attention, with the company's own suggestion as to the application, to turn the idea to practical account in their own interests. They insisted on a reduction in their bills. When the company protested, and collectors urged payment in full, they were met with a request to take out the telephones. A few months ago cartloads of Bell telephones which had been discarded and were being returned to the exchanges were common sights in the streets of Seattle, and the company was not anxious to see the experiment repeated. Every instrument taken out is a permanent loss, as the Independent company is able and very willing to take care of the business. So now the company is decidedly perplexed, while the operators are in high glee.

ANOTHER EXAMPLE OF REMARKABLE REASONING.

THE operating department of the Bell company which serves the territory along the Pacific Coast seems just now to be possessed of a positive genius for getting itself into trouble. The latest news from San Francisco is to the effect that the telephone operators in that city are planning to organize a union. Of course, this would never do, and the management took prompt action, issuing the following order:

"Any operator attending a meeting called for the purpose of organizing a union will be discharged. Every operator who does not enter the proposed union will receive a substantial increase in salary, amounting to from 30 to 50 per cent."

When the operators saw this it required no very astute application of the various processes of feminine reasoning to discern what was tantamount to an admission of weakness in the last clause. If the company were so much in need of operators that it would give so substantial a "raise" to those who would remain quietly in its employment, why could not the raise be forced? And if it were forced they would have all the fun of belonging to a real union into the bargain.

So the operators have met—three hundred of them—and are said to be determined to go ahead with their union whether the company is willing or not. In the meantime the company's order stands, and the young women are very much interested to see how far the company will go in making good both the threat and the promise.

PHANTOMS AND OVERLOADED LINES.

SOMETIMES we hear from a man who has a trunk line between two towns, with, maybe, eight, fifteen or twenty telephones bridged across it. He is very likely to ask if it will not be possible for him to "phantom" this line and get a third grounded circuit to be used for simultaneous telephony and telegraphy. Now, the only proper thing for a man in such a fix to do is, if he doesn't know just how far he can push the loading of his lines, to ask someone who will give him the information he needs. At the same time it will do no harm to call attention to the fact that the "phantom" principle does not permit of doubling up lines heavily loaded with instruments, but is effective only when applied to clear trunk lines. If the component lines are not well built, well balanced and highly insulated it is impossible to give good service over either the phantom or the original lines. New transpositions must be correctly made or all the circuits will be spoiled. Even under the best of these conditions, while in effect a third line has been added, the efficiency of the system has not been increased by 50 per cent., as the original lines are rendered less efficient. The phantom circuit cannot be made an excuse for the indefinite loading of lines.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

IRREVOCABILITY OF PERMISSION TO ERECT POLES ON FARMER'S LAND.

Your paper I find very useful. I have two questions that I wish you would answer. Eighteen months ago we built a telephone line on the public road and ran across one corner of a man's farm, setting two poles in his field with his verbal consent. Now the road has been changed to go around this corner of his farm, and he wants us to move the poles. Can he make us do it?

The other question is this: Can a party make us move poles off his farm. A public road ran through his farm, but now it has been changed to go around. We did not have the consent of the person who owned the land. At the time we built our line he did not make any objection, but sold it to another party, and he wants to make us move our poles since the public road has been changed. We have a privilege from the county court to build lines on any public road in the county. Can this party make us move poles without paying us the cost of changing? J. G. R.

THE permission that the farmer gave you to put two poles on his land amounts in law to a license. It is a disputed question whether a license which is accepted and acted upon by the expenditure of money in reliance upon it is revokable at the will of the person granting it or not. Some courts hold it to be revokable and some non-revokable. W. U. Tel. Co. vs. Pa. Tel. Co., 129 F., 849; 68 L. R. A., 968. In other cases a license is held not to be a vested right. Redfield Tel. & Tel. Co. vs. Cye., 49 A., 1047. The cases in which the license has been held to be non-revokable were all where the permission was put in writing, executed with the formalities of a deed. We believe that under the circumstances of your case, the court would hold that the license was revokable, and that the land owner might require you to move your poles off his land in the case your mention. You did not state that you paid anything for the permission to build on his land, so we assume that you did not.

In the case where the consent was not given except by silence and making no objection, the same rule would apply. The party to whom the consenting owner sold would stand in the same position so far as legal rights are concerned as the original owner. The question in this case therefore is the same as the question in the other and the same answer applies to both.

DULUTH COMPANY CLAIMS TAX EXEMPTION.

THE Duluth Telephone Company has commenced proceedings in the district court in that city asking that taxes and assessments for street improvements against some of its real estate be set aside. The company declares that it is a corporation existing under the laws of Minnesota, and as such is exempt from local taxes and assessments under the gross earnings tax law, adding that the gross earnings tax has been paid into the state treasury in compliance with the law. The company explained that the east half of the lot in question, though not occupied by a building, is necessary for the storage of poles and equipment, and has been used for such purposes only.

HOUSE MOVING ENJOINED AT HOUSTON, TEXAS.

THE Citizens Telephone Company of Houston, Texas, filed suit against J. Enger & Co. and the City of Houston asking that an injunction be granted to prevent the moving of a two-story house by contractors in such a way as to interfere with its wires. The temporary injunction asked for was granted.

It was conceded that defendant took the prescribed steps of consulting the city and depositing $25 to cover damages to wires, but it is claimed that the line of the company had already been crossed at three places, and that defendants proposed to carry the house beneath the wires and cables again, which would cost the company $50 in addition to its previous losses and put 100 telephones out of service for from six to ten hours.

The company claimed that it would be damaged to the extent of $500 and pleaded the constitution of Texas and the fourteenth amendment of the United States Constitution as a bar to such procedure, which it alleges would be the taking of private property without due process of law, and without just compensation. The company further offered to cut the wires and permit the passage of the house if the mover would guarantee to refund the expenses involved in doing this work.

CONTRIBUTION FROM COMPANY FOR DAMAGES RECOVERED FROM CITY.

AN action to recover $5,000, the amount paid by the City of Erie, Pa., to Barbara Mone, widow of Nicolas Mone, as damages occasioned by her husband's death, was brought by the City of Erie against the Mutual Telephone Company. In September, 1901, Peter Hoffman moved a house and barn up German street, having secured proper permit from the city authorities. When Hoffman reached the place where a certain guy wire belonging to the telephone company crossed the street, he found that it was in his way and accordingly took it down until the buildings were moved and then replaced it. He evidently did not fasten the wire securely, for it loosened and falling to the ground rubbed against high tension wires of the Erie Electric Light Company until the insulation was worn off, and became highly charged also.

Mone, a workman, while going to his work, was killed. His remains were found beside the loose wire with his hands and shoes burned off. Barbara Mone, his widow, brought action against the City of Erie for damages, and the city notified the Mutual Telephone Company to defend the action, but the telephone company refused. A verdict of $5,000 which the jury in the case awarded was paid by the city.

The suit by the city against the telephone company was finally settled by the company paying $2,500, or half the amount asked, after the jury had disagreed.

OPERATING DUPLICATE TELEPHONE EXCHANGES A CRIMINAL OFFENSE IN OKLAHOMA.

WORD comes from Guthrie, Oklahoma, that the Pioneer Telephone Company, a Bell corporation, was fined one hundred dollars and costs in the police court at El Reno for violating a city ordinance prohibiting one telephone company from operating more than one telephone exchange in the city. Evidence was introduced to show that the two exchanges now operating in El Reno were really under one management. The defense sought to prove that though really under the same management separate sets of books were kept, one for the Pioneer company and the other for the Topeka and El Reno company, recently absorbed by it. Employees who were called to the stand testified that they were employed some by one company and some by the other, but all received their pay from one manager. Bank checks were introduced in evidence which had been made payable to the Topeka & El Reno company, but endorsed by the Pioneer Company.

QUERIES

REASON FOR "CONDENSER KICK."—(851.)

In testing on a common battery line to determine its condition with a voltmeter we can get a throw of the voltmeter needle upon connecting battery to the line. This I am told is a "condenser kick." I have noted that the kick is not as great on a single party line as upon a line on which there are several instruments. Inasmuch as I understand that each additional instrument across the line has just that much more of a shunt effect, I fail to see why we get a greater kick. It appears to me that, owing to the greater short circuiting effect, as much current would not go through the voltmeter, and consequently the kick would not be as great. Can you explain to me why this is? N. F.

In throwing your voltmeter battery on to the line, and getting a "condenser kick," as you say, we would call your attention to the fact that the kick is due to the capacity of the line and amount of current absorbed by the condenser in the instrument. Even though there were no telephones upon the line, you would still get a kick, owing to the absorption effect or capacity of the cable. However, when there is a condenser upon the line the capacity of the line is increased just that much, and naturally you will get a larger kick. Place more condensers in parallel and you increase the capacity, and so get a larger "kick." The effect on the needle is due to the amount of current absorbed by the line and then discharged back into the voltmeter; consequently the greater the amount of absorption the greater the amount of discharge.

DEFLECTION OF TANGENT GALVANOMETER.—(852.)

In testing with a tangent galvanometer I note that the deflection of the needle is not commensurate with the amount of battery applied to the circuit; that is, when I place two cells of battery in circuit with the galvanometer I secure a certain amount of deflection, but in placing four cells in circuit I do not obtain twice the deflection, nor do I in placing six cells obtain three times the deflection, but in each case the deflection drops below the multiple. Why is this? L. B.

This is due to the fact that as the needle of the galvanometer swings out, or swings at a tangent to the lines of induction, it is not affected by as many, and consequently the deflection is correspondingly smaller.

In constructing tangent galvanometers it is customary to make

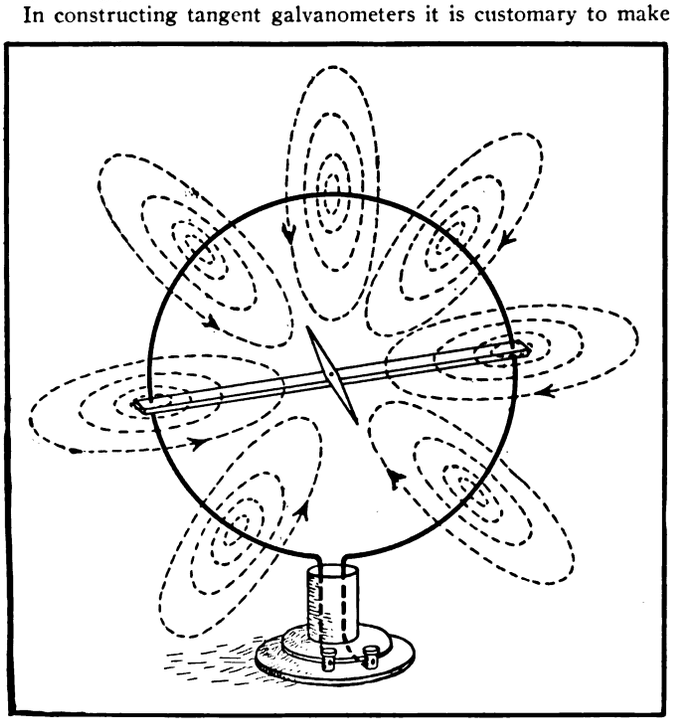

Fig. 852-a.

the needle very small in comparison with the diameter of the field in order that it may at all times be within that portion of the magnetic field having the greatest density. Evidently your needle is large in comparison with the field diameter, and consequently swings out of the portion having the greatest number of lines of force. This is exemplified in the theoretical sketch

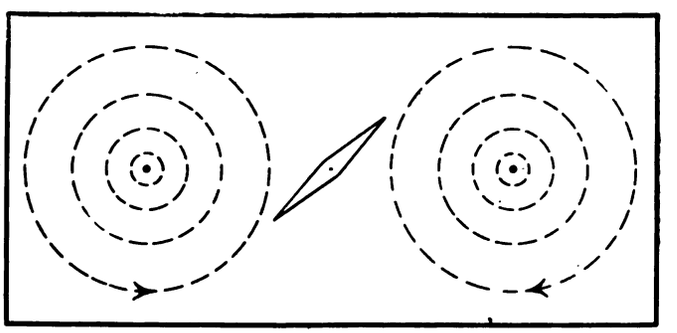

Fig. 852-b

shown in figures 852*a* and 852*b*, which roughly show the position of the needle in the magnetic field. The lesser density of the field near the center of the coil, that is to say, as the pivot of the needle is approached, is indicated by the greater distance between lines representing the magnetic flux.

UNDERWRITERS' RULES FOR WIRING.—(853.)

The writer understands that there are some rules specified by the National Board of Fire Underwriters appertaining to the method which must be used in the installation of telephone lightning arresters, but is unable to find these rules. If you will kindly favor him with the same you will greatly oblige. P. R. G.

The rules as provided by the National Board of Fire Underwriters for the installation of telephone lightning arresters are under the head, "Installations where the current carrying parts of the apparatus installed are not capable of carrying indefinitely a current of ten amperes," and are to the effect that the line must be provided with an *approved* protective device located as near as possible to the entrance of wires to building.

The protector must not be placed in the immediate vicinity of easily ignitable stuff, or where exposed to inflammable gases or dust, or flying of combustible material.

Wires from the entrance to building to the protector must be supported on porcelain insulators, so that they will come in contact with nothing except their designed supports.

The ground wire of the protective device must be run in accordance with the following regulations:

1. It shall be of copper and not smaller than No. 18 B. & S. gauge.

2. It must have a perfect rubber insulating covering.

3. It must run in as straight a line as possible and to a good, permanent ground. This may be obtained by connecting to a water or gas pipe, connected to the street mains and in service, or to a ground rod or pipe driven in permanently damp earth. When connections are made to pipes preference is to be given to water pipes. If attachment is made to a gas pipe the connection in all cases must be made between the meter and the street mains.

In either case the connection must be made as near as possible to the earth. When a ground wire is attached to water or gas pipes the pipes should be thoroughly cleaned and tinned with rosin flux solder, if such a method is practicable. The ground wire should then be wrapped tightly around the pipe and thoroughly soldered to it.

When the above method is impracticable, then, if there are fittings where a brass plug can be inserted, the ground wire should be thoroughly soldered to it. When the ground wire is attached to a ground rod driven into the earth the ground wire shall be soldered to the rod in a similar manner. Steam or hot water pipes must not be used for a protector ground.

IN THE OPERATING FIELD

MICHIGAN MANAGERS TO MEET AT OWOSSO.

ON April 16 the executive committee of the Independent Telephone Managers' Association of Michigan met at Owosso and prepared a program for the next meeting of members. In arranging for the papers the central idea was to have a program which applies directly to the operating side of the business, and which will particularly appeal to the women engaged in telephone work.

The next meeting, to be held at Owosso on May 8 and 9, is therefore to be a sort of ladies' convention, and Mr. H. T. Clough, the secretary, says "every member of the association who has a wife is expected to bring her, and if he is not provided to hurry up a little bit and get one."

The general managers of the several companies have been requested to make it possible for chief operators and other lady employees to attend the convention. The program is as follows:

WEDNESDAY, MAY 8, 2 P. M.—First Section of Program: "The Operating Room."

Address of welcome—Hon. Dr. D. H. Lamb, Mayor.

Response and opening address—Mr. F. V. Newman, president.

The Chief Operator—Miss Margaret Heney, chief operator, Owosso, Mich.

Discipline and Deportment of Operators—Miss Fannie Hiddie, chief operator, Grand Rapids, Mich.

Information Department—Miss Amelia Kowlski, chief operator, Ann Arbor, Mich.

The Merit System with Operators—Mr. C. E. Smith, manager, Cadillac, Mich.

Service Reports—Mr. H. W. Sexton, wire chief, Owosso, Mich.

General discussion of all papers.

THURSDAY, MAY 9, 8.30 A. M.—Second Section of Program: "Toll Work."

Through Business—Mr. B. L. Carson, manager, Bay City, Mich.

General Handling of Toll Business—Miss Inez E. Close, manager, Pontiac, Mich.

Following Up Unfinished Toll Tickets—Mrs. Florence R. Gould, chief operator, Battle Creek, Mich.

Co-operation Between Toll Operators—Miss Jessie D. Presley, manager, Belding, Mich.

Information on Toll Tickets—Mr. Geo. F. Stratemeyer, traffic manager, Grand Rapids, Mich.

General discussion of all papers.

The program of Wednesday will be followed at 6:30 P. M. with a dinner, after which there will be speaking and toasts and an informal dance.

TEXAS LEGISLATION.

BY CHAS. F. SPEED.

THE Legislature of Texas got somewhat ambitious this session and introduced a number of bills affecting the telephone business. So important was the proposed legislation, that the Texas Independent Telephone Association advanced its annual meeting thirty days in order that proper action might be taken.

The association appointed Mr. J. B. Earle, of Waco, as committeeman in charge, with instructions to appoint his assistants. He named Mr. J. E. Boynton, of Waco, and Sidney L. Samuel, of Fort Worth, two of the brightest and most successful attorneys in Texas, both of whom, fortunately, are interested in Independent telephone development.

That the committee was exceptionally strong is shown by the results obtained, which were far beyond the expectation of any one. They proceeded along educational lines, believing that if the members of the Legislature could be fully informed as to the true situation no harm would be done the Independent cause.

The first bill requiring attention was the well-known physical contact measure requiring interchange of business between the Independents and the Bell Co. This was a Democratic platform measure. How it got there no one knows, but there was a demand that platform measures be passed. The committee acted wisely in getting a harmless substitute bill approved by the Legislative committee, and then arranged for riders on the bill in the form of amendments to be introduced should the bill come up for passage, making the bill less effective. Then it required hammering from all sides to make the Legislature lose interest in the bill, with the result that it was never called from the committee.

The next bill requiring attention regulated the rates of exchanges in towns of different sizes, the effect of which would have been to reduce the rentals in many towns and cities. The Bell Company had more to lose by this bill than the Independents, but these same Independents are growing rapidly in Texas, and will soon occupy so prominent a position that they were interested in proving to the Legislative committee the effect of such a measure. This was done with such force that the bill never left the committee room.

The third bill stirred up the whole State, it being a tax of 3 per cent. on gross receipts. To prevent the passage of this bill letters were sent out to every exchange owner requesting that his representative be informed as to the true situation, and it is enough to say that the chairman of the legislative committee says he had no idea there were so many telephone companies in Texas. The members are now better informed, and have no desire to pass any bills unfavorable to the encouragement of the Independents.

The association committee has done its work well and accomplished results which will be far reaching, and the association will be stronger as it becomes known what can be accomplished by the combined efforts of its members as an association.

Notwithstanding the present strong sentiment against the physical connection measure, the Governor has called an extra session, in which, among other things, he demands that a bill be passed requiring telephone companies to connect. This is regarded as a serious mistake, as the telephone systems of Texas are as yet not sufficiently developed to serve the needs of the people, and the present bill is directly contrary to the public interests.

REMARKABLE ATTITUDE TAKEN BY CENTRAL UNION (BELL) COMPANY TOWARD LOCAL BUSINESS IN INDIANA AND OHIO.

STATEMENTS are rife in the states of Indiana and Ohio that the Central Union (Bell) Company is meeting with such poor success in local business, owing to its having been so thoroughly outstripped by the Independent exchanges, that it is anxious to give up this branch of its business wherever it has fallen behind, and confine itself exclusively to carrying toll messages.

It is said that W. P. Sylvan and J. L. Putnam, sub-license agents of the Central Union Telephone Company, have, in connection with this matter, made verbal offers to sell or lease the Central Union local exchanges to Independent companies in Fort Wayne, South Bend and a number of other localities in Indiana where the Independent companies are very much in the lead. The proposition they are reported to have made is to enter into an arrangement whereby the long distance business will be divided on a percentage basis, the Independents to retain the use of such long distance lines as are now in operation, while for points to which they have no long distance lines the

Digitized by Google

toll business is to be turned over to the Central Union lines in consideration of the closing of its local exchanges.

In Indiana these two men have been invited to meetings of Independent telephone men to announce their proposition publicly, and have been asked to put their proposition into writing, but both of these things they have declined to do. Their plan is to single out an officer or manager of an Independent company, and make the proposition verbally.

Considerable interest has been aroused in Indiana by these movements, and the result has been a discussion of the question at two recent district conventions, and a conference at Fort Wayne, held on April 19, which was attended by representatives from several of the most prominent companies in the northeastern part of the State. At this convention managers and officers from the Logansport, South Bend and Fort Wayne Independent companies stated that the proposition had been made to them by Messrs. Sylvan and Putnam. After a discussion of the proposition it was decided that no individual company nor district branch of the association should take any action on the proposition by itself, but that all information gathered should be referred to the State meeting, which is to be held in Indianapolis in May. Representatives of the Ohio association will also be present at this meeting. President Lindemuth, of the State association, has called a meeting of the executive committee in Indianapolis, on April 27, to confer with the officers of the Central Union Company, and learn from them, if possible, whether or not the proposition made by Sylvan and Putnam is authorized, and get any further details which may be given out.

In Indiana the Independents believe that the Central Union is "up against it." Its local business in many localities has fallen far below a paying basis, and something must be done to save the company from ruin.

In Ohio the Bell people are announcing the progress of negotiations for transferring the Bell exchanges at Delaware, Bucyrus and Marion to the Independents, with the contingent agreement that Bell toll lines shall be used. Although it has been announced in some quarters that the deal covering these three places has been perfected, President Frank L. Beam, of the Ohio Independent Telephone Association, writes, under date of April 23, that "neither of these companies has closed any contract of any sort with the Central Union or Bell interests, and will not, except it be through the medium of the State organization. The proposition made in the course of these negotiations has, by each of the companies mentioned, been referred to the State association, and no action will be taken by these companies, or by any Independent company in this State, except it be in conjunction with and with the advice of the representative organization of the Independent telephone interests of Ohio, that is, the State association."

This shows conclusively the attitude taken by the Independents, who are holding together strongly in spite of the fact that in these three cases, and probably in others, negotiations were started secretly, and a determined effort made to bring them to a conclusion with as little publicity as possible.

That the Independents of Ohio are thoroughly in control of the local situation is shown by the statement of President Beam in the same letter, to the effect that a carefully prepared and reliable collection of statistics recently made shows that on March 31 the strength of the Independents in Ohio, outside of Cincinnati, which is still a non-competitive point, was represented by more than 298,000 telephones installed, as against 141,000 claimed by the Bell people, including Cincinnati, where they have 42,000 telephones.

A REMARKABLE TROUBLE TICKET.

THE accompanying illustration is a reproduction of part of an actual trouble ticket which was formerly included in the records of the Home Telephone Company, of Mobile, Ala. E. H. Davidson, the wire chief, who is authority for this news, furnishes the information that the arrester was mounted

outside, and together with the attached wire, was a morsel too tempting for resistance, either to the appetite or curiosity of a stray goat.

That the goat was a beast of very unusual intelligence is shown by the nature of the trouble indicated at the switchboard. The burning of the line lamp shows that he had crossed the wires, so that he could enjoy his meal undisturbed by any ringing current which the operator or wire chief might throw on the line.

THE WORTH OF A MAN

lies not so much in that which he has memorized, but in his ability to readily secure the information he desires. AMERICAN TELEPHONE JOURNAL *keeps in touch with a staff of telephone men, each an authority in his particular line, who are ready and willing to give you the information you desire in response to all questions on practical telephone work. Why? Because anything that helps a single telephone man helps the business, indirectly perhaps, but nevertheless it helps. Here is a motto for you, "When in doubt write the Editor of* AMERICAN TELEPHONE JOURNAL, *100 William St., New York."*

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE.—We offer for sale the following assortment of Stromberg-Carlson Central Energy telephones displaced by our installation of Automatic equipment:

250 Type E central energy desk telephones with stationary head, corrugated nickel-plated pedestal, black enamel metal base, bipolar receiver, gold electrode transmitter.

1,000 No. 204 desk telephones with adjustable transmitter, knuckle joint arm, nickel-plated pedestal and base, same transmitter and receiver as above.

100 Type C. E., latest style desk telephone with No. 4 transmitter, all rubber bipolar receiver, black rubber pedestal, nickel-plated base, induction coils at end of cord instead of in base. A modern instrument.

1,000 Former type ZZ, later known as No. 37, business style central energy wall telephones complete with triplet set consisting of combined switch-hook, transmitter with adjustable arm, bipolar receiver, etc. This instrument is provided with shelf.

100 Former type Z. later known as No. 35, residence style, central energy wall telephone without shelf, otherwise same as No. 37.

These instruments are in good condition and will be sold at a reasonable figure. Prices will be furnished upon application to W. F. LAUBACH, Manager, Akron People's Telephone Co., Akron, Ohio. 822

FOR SALE, cheap, 10,000 feet single duct Camp conduit. Make us an offer. Address, Schenectady Home Telephone Co., Schenectady, N. Y. 812

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

SITUATION wanted by first-class man as manager of exchange or territory, 5 years experience with Bell, and can show results. Advise particulars and salary. Address, Box 813, care American Telephone Journal, 100 William St., New York. 813

WANTED.—Chief operator for an exchange of 1,400 in a good Ohio town, population 10,000. Want a competent party, one who can manage service, monitor, and supervise operators, arrange hours and take entire charge of operating room. Good wages to one who can get results. Address Box 815, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 815

WANTED.—The management of an electric light plant where the business can be built up. Have had experience and can "deliver the goods" on any electric lighting proposition. Open for engagement after July 1, 1907. Address Box 816, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 816

WANTED.—Competent man as superintendent, also first class switchboard repair man. Good salary for first class man. None other need apply. Address, Box 821, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 821.

WANTED—Competent cable splicer. Position permanent. Send references. Address, Zenith Telephone Co., Duluth, Minn. 809

WANTED—Experienced local cable and switchboard wiremen for factory work. Call or write, giving experience. Automatic Electric Company, Morgan and Van Buren streets, Chicago, Ill. 820

TELEPHONE PATENTS

TELEPHONE TRUNKING SYSTEM.

Harry C. Goldrick, Indianapolis, Ind., patents (No. 845,077; dated Feb. 26, 1907; filed Sept. 17, 1902; serial No. 123,696) and assigns to Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone trunking system.

This patent covers a trunking system operative between two telephone exchanges of the two and three wire types, respectively. The connections are made in the manner usually employed, whereby the operator desiring connection with a subscriber of another exchange throws her talking set in on an order wire and makes her desire known to the B operator, who assigns a trunk with which to connect and then completes the connection by inserting the plug attached to the B end of the trunk in the proper jack of her multiple.

TELEPHONE FOR THE DEAF.

Lewis F. Clarke, Boston, Mass., patents (No. 849,353; dated April 2, 1907; filed Feb. 13, 1907; serial No. 357,154) and assigns to Globe Ear Phone Company, Boston, Mass., an electric ear-phone.

This invention comprises a transmitter attached to a pocket battery so that it may be readily slipped into the coat pocket. A receiver of the watch-case type is connected by a flexible cord.

TELEPHONE TRUNKING SYSTEM.

Francis W. Dunbar, Chicago, Ill., patents (No. 847,984; dated March 19, 1907; filed August 25, 1902; serial No. 120,878) and assigns to Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone trunking system.

This invention relates to a trunking system between exchanges of the two-wire type. At the outgoing office the subscribers' lines are provided with cut-off relays and with test terminals connected in local circuit, and the subscriber's bells are grounded from one side of the line. The operator's cord circuits connect inductively with the subscriber's lines through a repeating coil which has connected to it at an intermediate point a supervisory relay legged to ground through a central battery.

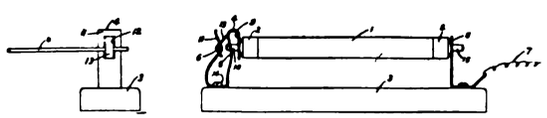
At the incoming office the subscribers' lines are provided with cut-off relays actuated over a portion of the talking circuits and the testing contacts of the jacks are connected directly with one side of the talking circuits.

The method of operation of the trunk circuit is that usually employed.

FUSE CLIP.

Frederick R. Parker, Chicago, Ill., patents (No. 849,159, dated April 2, 1907; filed March 14, 1906; serial No. 306,037) and assigns to Frank B. Cook, Chicago, Ill., a fuse clip.

This device comprises a single piece of spring metal so



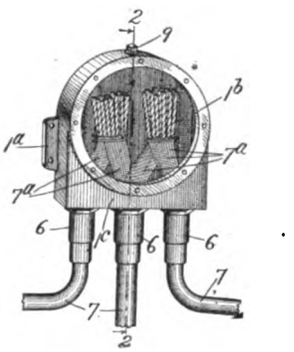
shaped as to clamp both the fuse terminal and the circuit wire in place, thereby connecting the one to the other.

The terminal spring 4 is made of a single leaf spring formed with holes through the portions 8, 9 to accommodate a spindle 10 of a fuse terminal 2, which is securely clamped in place when the opposite end of the fuse is pressed in place in the terminal spring 5. The turned up portion of the spring 4 is slotted and a tongue 13, cut from the spring 4, extends therethrough, so that the conductor 6 when placed between the spring portion 11 and the tongue portion 13 may be securely retained.

JUNCTION BOX.

Henry E. Procunier, Oak Park, Ill., patents (No. 848,047; dated March 26, 1907; filed Feb. 6, 1905; serial No. 244,315) an electric cable splicing and distributing box.

This patent describes a junction box for cables in which



taps may be taken in various directions from another cable. It comprises a box of metal made in a single piece aside from the cover having lugs 1a, 1a, by means of which it may be attached to a pole or other support, and a plurality of nipples 6, 6, 6, providing entrance for the cables. The upper portion of these nipples is provided with an enlarged cavity, leaving room about the cable for solder, lodged in an annular deposit within the upper portion of the cavity, to run down when melted by the application of heat to the nipple, and by uniting with the lead sheath form an air-tight joint. The pocket 1c may then be filled with paraffin as additional protection, and the cover applied with an air-tight packing between its flange and that of the box.

WIRE GRIP.

Vassel W. White, Utica, New York, patents (No. 843,921; dated February 12, 1907; filed September 29, 1906; serial No. 336,680) a wire grip.

This patent covers a form of wire grip for use in pulling wire to the proper tension on telephone lines or elsewhere. The description shows two parallel bars attached to two eccentrically mounted levers to the outer ends of which are fastened the ends of a chain. When a pull is exerted on this chain the levers cause the clamps to move toward each other, tightly gripping the wire between them.

TELEPHONE TRUNKING SYSTEM.

Harry G. Webster, Chicago, Ill., patents (No. 847,385, dated March 19, 1907; filed August 1, 1902; serial No. 117,920) and assigns to Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone trunking system.

This invention relates to a trunking system similar to that described in application of Francis W. Dunbar, filed August 25, 1902, serial No. 120,878. In this patent, however, the A cord

PATENTS—Continued

circuit is provided with batteries bridged across each end, one pole of which is grounded, and the trunk relay at the incoming end of the trunk is normally legged to ground from the tip side of the trunk, the metallic circuit of the trunk being at the same time open. There is a relay which operates when the called subscriber answers to disconnect the trunk relay during conversation and to complete the metallic circuit of the outgoing end of the trunk, instead of using the repeating coil arrangement as shown in the application of Mr. Dunbar.

TRUNK CIRCUIT.

Joseph Beryl Kelly and Edwin Bowen Heaford, Omaha, Neb., patent (No. 848,749, dated April 2, 1907; filed December 31, 1906; serial No. 350,302) a trunk circuit for telephone systems.

This patent covers a two-wire, one-way trunk circuit for use between a local and a toll switchboard. A lamp is used for attracting the attention of the toll operator. It is controlled from battery in the local cord circuit, flowing through a relay bridged across the trunk, and put out, when the toll operator answers, by the operation of a relay inserted in one side of the trunk, shunted by a non-inductive resistance. In the other side of the trunk is a relay of similar dimensions, balancing the circuit and connecting across the trunk an impedance coil, to operate in shunt with an impedance coil bridged across the toll cord circuit, the supervisory signal at the local position.

MEMORANDUM DIRECTORY.

Charles E. Napp, Trenton, New Jersey, patents (No. 845,703; dated Feb. 26, 1907; filed Jan. 3, 1906; serial No. 294,433) a telephone directory or book.

This patent covers a form of memorandum telephone directory comprising two plate covers enclosing, on one side, a series of cards alphabetically indexed, upon which may be placed the names, telephone numbers, etc., of the persons with whom the subscriber has frequent communication, thus obviating the necessity of searching the directory furnished by the telephone company for the number.

On the other side is fastened a memorandum pad.

TELEPHONE TRUNKING SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 848,814, dated April 2, 1907; filed July 26, 1902; serial No. 117,059) and assigns to Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone trunking system.

This patent covers a form of trunking system for connecting lines of the Dunbar or two-wire type with lines of a different type, a feature of which is the provision of means for placing the signaling apparatus associated with a trunk in condition to operate by current flowing over a circuit entirely independent of the ground connections which may exist on a subscriber's line.

AUTOMATIC TRUNKING DEVICE.

August Alvin Monson, St. Paul, Minn., patents (No. 848,120; dated March 26, 1907; filed November 27, 1906; serial No. 345,316) an automatic trunking device and selective signaling apparatus.

This patent covers a device to connect a number of outlying subscribers to a central point (which may be a distributing pole) and then connect this central point to a trunk line to the central station. A selective mechanism is placed at the subscriber's station, so arranged that the converging point of these lines, or the branch central, as it is termed, is partly under the control of the subscriber and partly under the control of the central station. The inventor aims to secure privacy by so arranging the selective mechanism that when any subscriber of the group connected may be using the line all of the others in the group are automatically cut-out of circuit. Further the inventor aims to have the device provided at the central office so operate that the operator may call any subscriber of a group connected to a branch central without disturbing the bells of the other subscribers.

TELEPHONE SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 849,375, dated April 9, 1907; filed May 11, 1901; serial No. 59,876) and assigns to the Kellogg Switchboard and Supply Co., Chicago, Ill., a telephone system.

This patent covers a form of two-wire common battery telephone system employing the usual sub-station arrangement in which the removal of the receiver from its hook causes a flow of battery through relay 6, which is comparatively sensitive, to the leg of the line l^2, through the instrument, through line l^1 and the marginal relay 5, to battery B^1, which causes an actuation of the armature of the

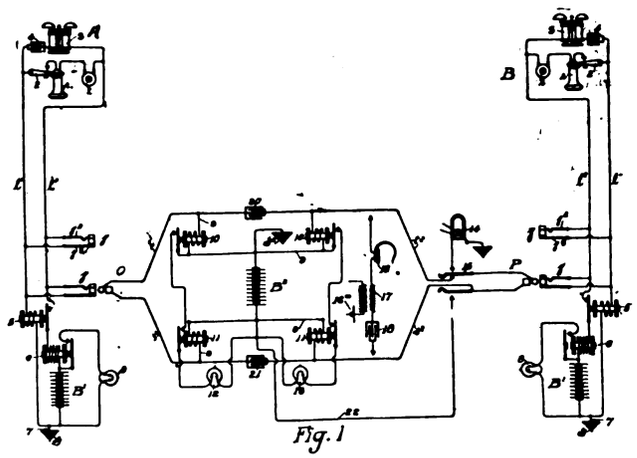

Fig. 1

relay 6. This closes the circuit in which is included the line signal 8. Upon insertion of the plug O into the jack j the flow of battery B^2 causes the actuation of the marginal relay 5, thus opening the circuit of the relay 6, and extinguishing the line signal 8. Relays 10 and 11 govern the supervisory signals 12 and 13 respectively and are operated by replacing the receivers upon the hooks while the plugs are in the jacks.

BATTERY BINDING-POST ATTACHMENT.

George H. Cove, Roxbury, Mass., patents (No. 842,771, dated January 29, 1907; filed November 26, 1906; serial No. 345,016) and assigns one-half to Frank R. Kimball, Boston, Mass.

This patent covers a form of U-shaped spring wire clamp that may be substituted on the battery connecting post for the nut usually employed. Lugs on the inside of the spring engage with the threads of the connecting post, holding the spring in place by means of the pressure exerted within itself. The wire is held securely by a double spring clamp, between the members of which it is inserted.

WIRE STRETCHER.

Oliver E. Lewis, Benson, Nebraska, patents (No. 845,102; dated Feb. 12, 1907; filed April 5, 1906; serial No. 310,114) a wire stretcher.

This patent covers a form of wire stretcher composed of a ratchet wheel and appropriate lever. The movement of the lever, causing the ratchet wheel to revolve, takes up, around lugs provided for the purpose, a flexible cable inwardly in both directions. This flexible cable has attached to it at one end some suitable form of wire clamp, in which the wire to be stretched is inserted.

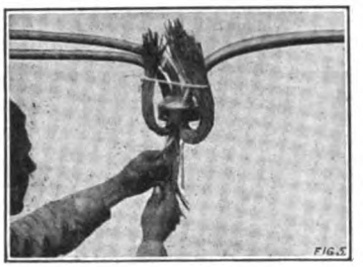
A MONEY SAVER



A MONEY SAVER

YOUR TIME

will earn money in direct proportion to your use of it. The use of the Hargis Cable Splicing Joint will enable you to save time. It will enable your regular linemen to make a better splice than an expert cable man. The picture above shows how easy it is to splice pairs by means of the Hargis Joint. They can all be tied out of the way while the splicing is going on.

The Hargis Joint is not a wiped joint in any sense of the word. The cables are simply put thru the cap and lead gasket and the lead is then poured in until the cup formed by the gasket and the brass cap is full. What wiping is done is simply to smooth off the rough edges, and does not add to the weather-resisting qualities of the joint.

HOW TO SAVE YOUR TIME

Let us send you descriptive matter of the Hargis Cable Splicing Joint shown above. By its use you can make a better splice in less than one half the time it takes to make a horizontal wiped joint, and at the same time you can always get into it by means of special tools to test out for trouble along the line.

It will pay you to write for our descriptive matter.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

PROMINENT TELEPHONE MAN ENDORSES NEW SOLDERING DEVICE.

BLAKE SIGNAL & MFG. CO., 246 Summer St., Boston, Mass., has recently received the following letter from the head of the telephone course at Purdue University:

PURDUE UNIVERSITY.
Winthrop Ellsworth Stone, Ph.D., President.

School of Electrical Engineering.

LAFAYETTE, Indiana, April. 11, 1907.

MR. E. J. BURKE, Pres., Blake Signal & Mfg. Co.,
246 Summer St., Poston.

Dear Sir—We have been using the sample of your tube flux in the telephone laboratory and have found it very convenient. Your idea of placing the compound in this form is certainly to be commended. We are daily doing more or less soldering, and the ordinary stick flux does not last long, due to waste. You have made a decided advance. Yours truly,

(Signed) ARTHUR BESSEY SMITH.
Dept. Telephone Engineering.

As this testimonial to the value of the tube flux was entirely unsolicited and Prof. Smith is a man who has passed through all the various branches of practical telephone work, the Blake Company is very much pleased with this statement as to value of its product. There are a number of important advantages in the use of this tube flux which the company will be pleased to explain in detail to those who are interested.

AMERICAN ELECTRIC FUSE COMPANY, Muskegon, Mich., in order to make clear its position in respect to the patent decision, announced in the April 13 issue of THE AMERICAN TELEPHONE JOURNAL, has written as follows:

"Inasmuch as this is a matter affecting our interests, we ask that the enclosed statement be printed under our name. We do not wish to conduct any controversy in your columns, but simply to set forth our position in this matter."

The statement is as follows:

"An interference proceeding in the patent office between Frank B. Cook and William Kaisling, we are informed, has been decided in favor of Frank B. Cook. We beg to advise the trade that we were not parties to this interference proceeding and were not represented by attorneys. William Kaisling has attempted to sell out his rights and patents to Frank B. Cook and has assigned his patents, application for patent and contracts with us, to Frank B. Cook. This was all done without any notice to us and without consultation with us in any way. Our attorneys advise us that our rights are not in the least degree affected by this interference decision or by the purported sale by Kaisling to Cook.

"We beg to assure all our customers that our rights are not affected in the least degree, inasmuch as we were not parties to this proceeding, and that we will protect and defend all customers on all apparatus furnished by us, either in the past or in the future."

THE NEW WESTINGHOUSE STORAGE BATTERY.

AFTER long experimenting and careful tests, the Westinghouse Machine Co., Pittsburg, Pa., has put upon the market a new storage battery. It is of the pure lead sulphuric acid type, the active material being formed from the pure lead of the plates by a Planté process with sulphuric acid as an electrolyte.

The type S-4 positive grid is illustrated at the left of Fig. 1, with vertical and horizontal cross-sections, and from this illustration and others one may form an idea of a number of the novel features employed in the construction of this plate. The parts adapted to become active consist of the small units represented by dark lines in the front view and horizontal section and these, of course, are pure lead leaves joined, at their ends only, to the round conductor ribs seen in the front view and in cross section in the left-hand sectional view. These conductor ribs are supported by the main stiffening ribs which surround the entire grid. These leaves are grouped in panels three to four inches square, dimensions varying with the particular size of the plate.

The entire plate including frame and leaves is of chemically pure lead, compressed into a homogeneous piece without any joints or welds. Upon the laminated surface is formed, from the lead itself, the peroxide of lead which furnishes the active material. Each lead leaf is transformed into a lead core which serves as a conductor for the current generated in the surrounding covering of active material. The core of pure lead in the plate, as put upon the market, is sufficiently large to furnish active material to replace the

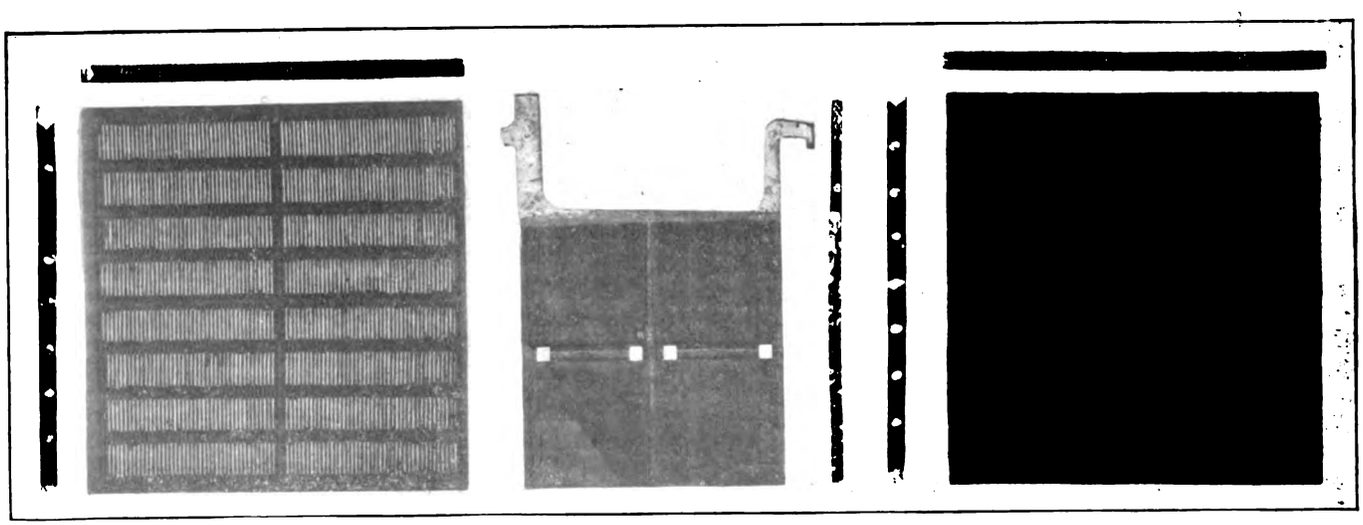

Fig. 1. Westinghouse battery—positive grid, type S-4, showing supporting structure, and lead unit leaves. *Positive plate of the new battery, showing entire supporting and conducting structure.* *Small positive plate, not provided with expansion openings, increase in size being taken up in beaded supports.*

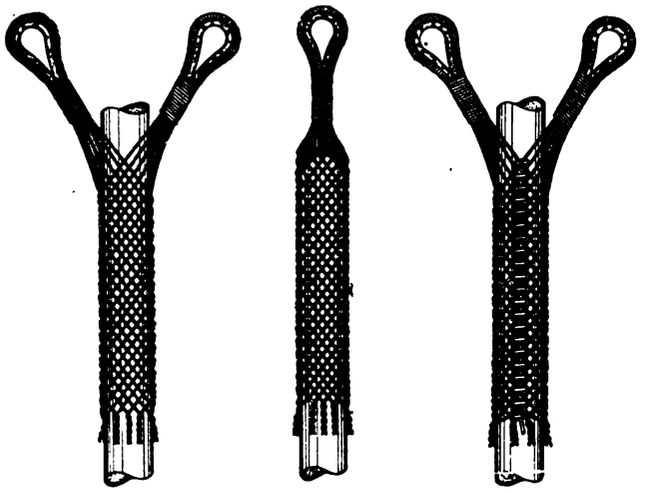
UNIVERSAL CABLE GRIPS

Indispensable for the economical handling of underground and aerial cables.

Will not cut the sheath. More readily adjusted than rope slings, marline or other grips. Saves its cost on every section of cable laid.



Cable pulled out, slack pulled in, or cable broken at mouth of duct pulled out rapidly and without trouble.

It is necessary only to get acquainted with this time and labor saving device, to appreciate its worth.

Get our prices and literature. Free on request.

loss due to the wearing away of peroxide which drops to the bottom of the cell and still provide ample conductivity during the entire life of the battery.

The space between the surfaces of adjacent leaves was determined by a consideration of the fact that the volume of lead peroxide is about twice the volume of lead from which it is made. Space must therefore be provided to accommodate all lateral expansion due to the increase in volume of the small units. Each of these units tends not only to expand laterally, but also to increase in length and this increase in length is provided for in a four panel plate by rendering top and bottom leaves slightly bow-shaped. In larger plates, adjacent panels are connected by a thin corrugated sheet. At each end of this expansion sheet is provided a rectangular opening, separating it from the vertical conductors. These rectangular openings, in addition to allowing all vertical growth to be taken up by the expansion sheet, allow the electrolyte to pass freely through the plate, thus equalizing its density on both sides, and promoting uniform working of the cell.

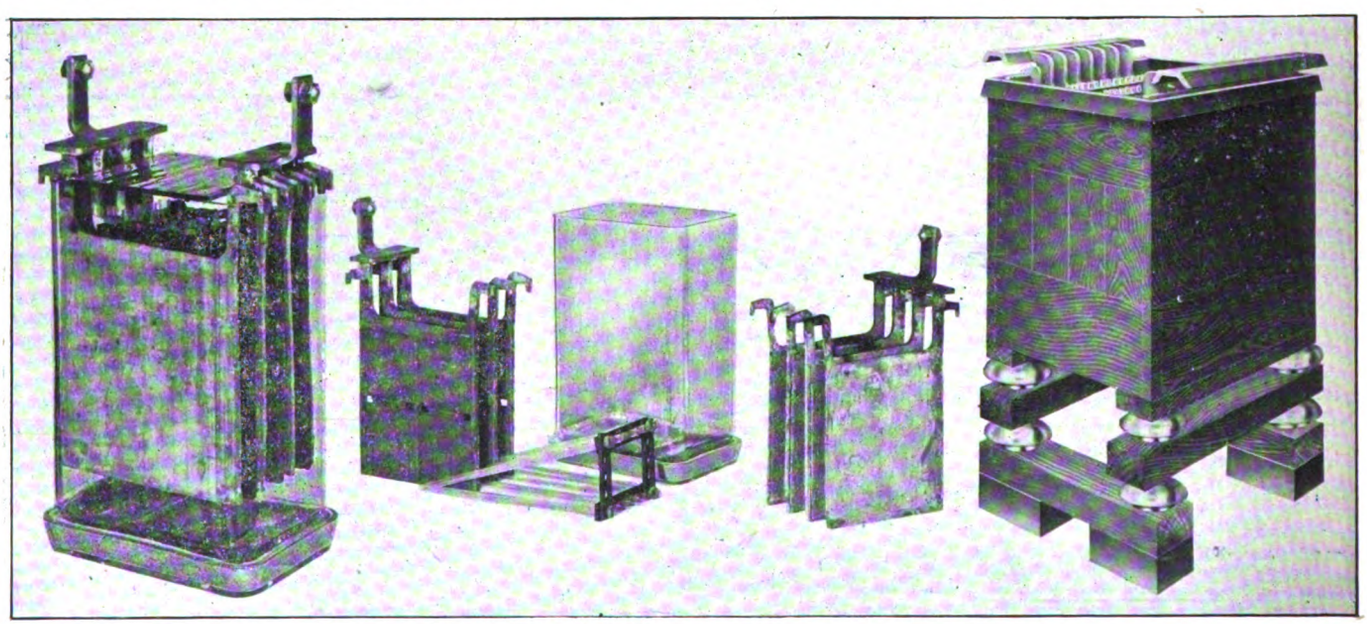
These elaborate provisions for taking care of any increase in volume in the Westinghouse plates are believed by the company to allow no room for defects due to buckling. Liability to this fault is also prevented by the fact that, owing to the slotted construction and short length of each of its leaves, every unit is independent of its neighbor, surrounded by electrolyte, and carries only that portion of the current which is supplied by its own peroxide. This gives a uniformity of distribution which allows a discharge to be carried on at a high rate, if necessary, without injury to the plate.

The negative plate is similar to the positive plate except that there is approximately thirty per cent. more active material provided by an increased number of laminations. As no longitudinal growth occurs in the negative plate, the expansion spaces are omitted. By providing a relatively greater volume of active material in the negative plate, the company expects to overcome the difficulties due to the shrinkage which brings about a gradual decrease from the original capacity of new Planté plates.

The Westinghouse Machine Co. has only brought out this battery after years of study and most careful investigations into the properties of different types of storage battery elements. It is prepared to furnish cells for all classes of work and has devoted careful attention to the development of cells and mountings particularly adapted to telephone work. Descriptions of the new battery covering technical features, standard sizes, etc., will be sent free of charge to interested telephone managers and engineers upon receipt of a request.

The National Conduit & Cable Co., 41 Park Row, New York City, in the last issue of its folder, *"Copper Gossip,"* traces the condition of the copper market for the past month and gives comparative tables showing prices in New York and London for the past 30 days and for the corresponding period last year. There is some other exceptionally interesting information in this number, which will be sent free of charge to anyone making a request.

Wesco Supply Co., St. Louis, Mo., and Fort Worth, Texas, in its April price list gives up-to-date figures on about everything that the telephone man can possibly use. It is anxious to let every manager see how the possession of this book will help him to save money, and will send it promptly to anyone who will mail a postal card asking for it.



General Views of Two Standard Types of the New Westinghouse Storage Battery Which Are Particularly Adapted to Telephone Work.

Sumter Telephone Mfg. Co., Sumter, S. C., has recently received what is not only a very good order but has the additional advantage of carrying a high-grade recommendation of the telephones made by this company. This order is for 600 wall sets and 200 desk sets to be used by the Signal Corps of the U. S. Army in this country and Cuba. The fact that these instruments which passed the government tests won the order, and are to be furnished, are standard wall sets, corresponding in every way to those which the company designates as its Five-fifty type and furnishes for the general trade, is an evidence of the value of this type of instrument. That the government is not alone in its approval of these sets is shown by the fact that the regular orders from telephone exchanges are keeping the assembling department of the company working overtime to fill them.

NEW COMPANIES.

EXETER, KAS.—An Independent telephone company has been formed at this city for the purpose of building a line from West Exeter to Oak Hill. F. A. Butler is the president.

GREAT BEND, KAS.—A charter has been granted to the Arkansas Valley Telephone Company, which is to build a line from Great Bend to Garden City. It is estimated the line will cost about $30,000.

ETNA, ME.—The Etna Telephone Company has recently been incorporated with a capital stock of $5,000, of which $530 has been paid in. The officers of the company are L. P. Toothaker, president; M. W. Toothaker, vice president; A. L. Sylvester, secretary and treasurer. The directors are L. P. Toothaker, O. Kelley, D. A. Sylvester, H. A. Friend and E. E. Carter.

ASHLEY, MICH.—An Independent telephone company, to be known as The Ashley Rural Telephone Company, has been organized. It is its intention to install an exchange at Ashley and construct a number of rural lines. The capital stock is placed at $10,000 in $20 shares, and the following officers have been elected: O. N. Fairbanks, president; Henry Kennett, secretary; Geo. Mitchell, treasurer.

CASS CITY, MICH.—The Cass City Telephone Company, which was organized some time ago, has filed articles of incorporation. It has an authorized capital stock of $5,000 and the Board of Directors is composed of the following members: J. C. Corkins, H. L. McDermott, B. F. Benkelman, J. D. Brooker and E. H. Bradfield.

COLD SPRING, MINN.—A rural telephone company, whose intention it is to construct a line from Cold Spring to Jacob's Prairie, has been formed, and connections will be made with the Minnesota Central Company.

HARRISON, MO.—A Farmers' Telephone Company has been organized at Harrison. It contemplates the erection of a line to Pilot Grove, at which place connection will be made with the Independent line being built from Blackwater.

ANDES, N. Y.—The Andes and Middletown Telephone Company, with a capital stock of $475, has been incorporated and the following directors named: J. T. Rooney, A. R. Wordon, Thomas Doig, all of Andes.

GILBERTSVILLE, N. Y.—Articles of incorporation have been filed by the Gilbertsville and Wellsbridge Farmers' Telephone Company, and the following officers elected: President, Clifford Wilber; vice president, John Stark; secretary and treasurer, Charles Ellis. The directors are C. F. Bushnell, Gilbert Leonard, Fred Church and C. C. Harris. Work on the plant is to begin at a very early date.

NORTHVILLE, N. Y.—An Independent telephone company is being formed in this city to build a line to Sacandaga Park.

RED HOUSE, N. Y.—The Seneca Independent Telephone Company, Red House, N. Y., has been incorporated with a capital stock of $10,000. Among the incorporators are Fred W. Gates, Sternberg, N. Y.; Robert W. Craim and Ira A. Gates, Red House, N. Y., and others.

BOTTINEAU, N. D.—Articles of incorporation have been filed by the Loop Mutual Telephone Company. It has an authorized capital stock of $8,000, and the incorporators are: Walter Minshull, Antler; R. F. Felton, R. A. Johnston, Haase; A. A. Lane, Sherwood; G. A. Esval, Sherwood; F. F. Bjornson and Frank Baska, Sherwood, N. D.

LEWIS, N. D.—The Lewis Mutual Telephone Company has been organized, and the following officers elected: Wm. Armor, president; F. E. Tennant, vice president; W. E. Shortrige, secretary; M. C. Bromaghin, treasurer. Directors: F. O. Johnson, of Tolley; A. E. Paulson, of Kenmare; A. P. Anderson and Wm. Armor, of Newport; F. E. Tennant, W. E. Shortrige, Fred Tunell, M. C. Bromaghin and Harry Frederickson, of Lewis.

CAPRON, OKLA.—The Capron Telephone Company has been incorporated with a capital stock of $7,000. The incorporators are F. J. Fash, W. D. Anderson and others.

CARMEN, OKLA.—Articles of incorporation have been filed by the Rich Valley Telephone Company, of Carmen. It has a capital stock of $1,000 and the directors are A. G. Melrose, E. Hughes and Walter Milam, of Carmen.

DRIFTWOOD, OKLA.—The Citizens' Telephone Company of this city has been chartered at a capitalization of $3,500 by J. W. Gass, W. E. Barkley and others.

BURNET, TEXAS.—The Smart Telephone Company, of Burnet, has filed articles of incorporation. The capital stock is placed at $10,000, and the incorporators are D. C. Reed, John McCarthy and C. Smart.

TOPSHAM, VT.—The Topsham Telephone Company has filed articles of incorporation and contemplates constructing and maintaining a telephone system in the towns of Topsham, Corinth, Newbury, Bradford, Orange, Groton and Ryegate. The central office is to be located at Topsham. The capital stock is given as $5,400, divided into three hundred shares, and the present stockholders are O. P. Dickey, East Corinth; J. P. Dickerman and E. Morrison, Groton; E. M. Hood, Topsham, and Geo. W. Merrit, Groton.

FUGATES HILL, VA.—Among the newly incorporated companies is the Russell Mentoda Telephone Company, of Fugates Hill. The capital stock is placed at $1,500 maximum, and $1,000 minimum, and the incorporators are J. C. Pruner, president; N. C. Fugate, vice president; T. J. Tate, J. E. Baker and others.

ORANGE, WIS.—The Badger Mutual Telephone Company, with a capital stock of $10,500, has been incorporated by G. B. Bailey, H. C. Abramson, H. J. Halberg and others.

PHILLIPS, WIS.—The Price County Telephone Company, Phillips, with a capital stock of $10,000, has been incorporated by R. L. Winchester, E. Vincent Covey, E. V. Winchester and L. A. Covey.

PORT WASHINGTON, WIS.—Articles of incorporation have been filed by the Port Washington Telephone Company. It has an authorized capital stock of $5,000, and the incorporators are W. B. Krause, Henry Holmes, A. H. Kuhl, J. W. Krause and J. H. Uselding.

COLDSPRINGS, ONT., CAN.—The Hamilton Township Rural Telephone Company, with head offices at Coldsprings, has been incorporated with a capital stock of $10,000.

STIRLING, ONT., CAN.—Articles of incorporation have been filed by the Stirling Telephone Company, Ltd., of Stirling. It has a capital stock of $10,000, and expects to construct, maintain and operate a telephone system within the county of Hastings and the townships of Seymour and Murray in Northumberland county.

FRANCHISES.

LOSTANT, ILL.—The Farmers' Mutual Telephone Company has been granted a franchise to operate in this city.

NASHVILLE, ILL.—Application for a franchise at Nashville has been made by the new Farmers' Telephone Company.

MORAN, KAS.—The Mutual Telephone Company which operates lines in Bronson, Elsmore, Savonburg and Humboldt is endeavoring to obtain a franchise in Moran.

VICKSBURG, MISS.—The Home Telephone Company, which has plants at Meridian and Hattiesburg, and which has been granted a franchise at Jackson, has applied for permission to construct and operate a telephone system at Vicksburg. If the company is successful it is its intention to install a plant of the most modern type to compete with the Bell Company.

NORTH YAKIMA, WASH.—The county commissioners have granted to the Cowichee Telephone Company, of Cowichee, the franchise for which it applied a few days ago.

FINANCIAL.

SOUTH BEND, IND.—At a recent meeting of the stockholders of the South Bend Home Telephone Company the regular semi-annual dividend of 1 per cent. was declared upon the stock.

WINTHROP, MINN.—At a recent meeting of the stockholders of the People's Independent Telephone Company the capital stock was increased to $50,000.

NORWICH, N. D.—The capital stock of the Norwich Telephone Company has been increased from $5,000 to $25,000.

FINDLAY, O.—The Findlay Home Telephone Company has increased its capital stock from $150,000 to $200,000.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

THE WEEK'S MESSAGES

WALBURG, TEXAS.—At a recent meeting of the Walburg-Weir Telephone Company it was voted to increase the capital stock from $4,000 to $7,000.

COMBINATIONS.

SHERMAN, TEX.—The North Texas Telephone Company, with headquarters at Sherman, and an exchange at Denison, has acquired the plant of the Phoenix Telephone & Telegraph Company. This plant consists of a toll line between Sherman and Honey Grove, with exchanges at Honey Grove and Bonham. It is the intention of the new owners to add a number of new copper circuits and to put the system in first class condition.

ELECTIONS.

PIASA, ILL.—The Piasa Mutual Telephone Company has elected the following officers: President, G. R. Waggoner; vice president, Geo. James; secretary, G. H. Clark; treasurer, A. M. Stratton.

CAMDEN, IND.—The Carroll County Co-operative Telephone Association has elected John W. Kerlin, of Rockfield, president, and U. E. Tesh, of Camden, secretary and treasurer.

NELSON, NEB.—The Nuckolls County Telephone Company has elected the following directors: Robt. Greenwood, Chas. Malsbury, B. F. Scroggin, W. A. Voigt, Wm. Peebler, I. C. Chamberlain, S. A. Lapp.

BROOKFIELD, N. Y.—At the annual meeting of the Brookfield Telephone Company, C. C. Craine was elected president, A. D. Chesebro vice-president and N. A. Crumb secretary and treasurer.

CANDOR, N. Y.—At a recent meeting of the Candor Telephone Company the following officers were elected: President, P. C. Meddaugh; vice-president, L. C. Burt; secretary, E. D. Holly; treasurer, H. D. Heath.

MANDAN, N. D.—The present officers of the Mandan Telephone Company are C. E. V. Draper, president and general manager; T. A. Cummins, vice-president; G. B. Furness, secretary; Jos. P. Hesse, treasurer.

WAITSFIELD, VT.—The following officers have been elected by the Waitsfield & Fayston Telephone Company: President, C. E. Jones; vice-president, E. S. Joslin; secretary and treasurer, F. J. Eaton.

CLINTON, WIS.—The following directors have been elected by the Clinton Telephone Company: H. A. Moehlenpah, J. F. Kemmerer, C. W. Collver, R. F. Helmer, I. Jacobson, B. Snyder and O. L. Woodward.

PERSONAL.

F. J. CUMMING, Claresholm, Alb., has been engaged as telephone superintendent for Edmonton, Alb.

P. E. HART, of the Allis-Chalmers-Bullock Company, Montreal, has been engaged as telephone superintendent at Kenora, Ont.

LOUIS MUHLHEIZLER, who has for a long time past been connected with the Pittsburgh & Alleghany Telephone Company, at Pittsburgh, Pa., as Superintendent of Maintenance, has recently been promoted to the position of Chief Engineer. Mr. Muhlheizler is well known to AMERICAN TELEPHONE JOURNAL readers, and has many friends throughout the country who will be pleased to learn of his advancement.

J. J. SPEED has been appointed general manager of the Valley Telephone Company, Saginaw, Mich. He has been in the past connected with the Missouri and Kansas Telephone Company as general foreman of construction for the State of Missouri, with headquarters at Kansas City, and is therefore especially fitted to take up the construction of the new plant which is now being built by the Valley Company.

WM. DEAN WILD has resigned his position in the operating department of American Telephone & Telegraph Company, New York City, to take up special traffic work for the Pacific States Tel. & Tel. Co. in California, with headquarters at Los Angeles.

MISCELLANEOUS.

CENTER, MO.—The Center Telephone Exchange, formerly owned by J. A. Keithley, has become the property of J. Rubison, who will manage the plant.

CALGARY, ALB., CAN.—The first government telephone line built in Canada is now in operation. It runs from Calgary to Banf.

FORT SASKATCHEWAN, ALB., CAN.—The Alberta government has taken over the telephone system at this place and will conduct it as a municipal enterprise.

New Construction in the Field

FRUITDALE, ALA.—New lines are being constructed by the Miller Telephone Company in this city.

WEST PALM BEACH, FLA.—The Independent Telephone Company expects to build lines to Stuart, and will also form connections with the Miami Telephone Company.

EDEN, ILL.—The Logan Township Telephone Company is to commence work on its system.

NEW WINDSOR, ILL.—The lines of the Eureka Telephone Company have been rebuilt.

WHITE HALL, ILL.—The Illinois Telephone Company is planning to entirely rebuild its system, and the exchange will be made strictly up to date in every particular.

LAPORTE, IND.—The Laporte Telephone Company, which has been improving its system at Laporte, is also installing exchanges at Rolling Prairie and Union Mills.

BOONE, IA.—New lines are to be built by the Boone County Telephone Company.

MOUNT VERNON, IA.—A large extension of its plant is planned by the Mount Vernon Telephone Company.

PAWNEE ROCK, KAS.—The Farmers' & Merchants' Telephone Company, which has recently extended its lines to Albert, at which point it has established a switchboard, expects to extend its party lines and form connections with several farmers' lines.

GOSHEN, KY.—Upon the completion of a trunk line from La Grange to Goshen, it is the intention of the Oldham Telephone Company, of La Grange, to establish an exchange at this place.

GRAND BLANC, MICH.—Many improvements in its system are being made by the Grand Blanc Telephone Company.

MARQUETTE, MICH.—About $18,000 in Marquette alone is to be expended by the Marquette County Telephone Company for the improvements which it has planned.

MONROE, MICH.—The Stoddard-Osgood Telephone Company has under construction lines to Detroit.

PONTIAC, MICH.—The plant of the Oakland County Telephone Company is to be completely remodeled, which will make it practically a new plant.

NEW YORK MILLS, MINN.—Among the improvements planned by the New York Mills Telephone Company is the installation of a new switchboard.

WOODLAKE, MINN.—New farmers' lines are to be erected by the Independent Telephone Company out of this city.

PLYMOUTH, N. H.—It is the intention of the Plymouth and Campton Telephone Company to extend its lines.

ALEXANDER, N. Y.—New lines are being constructed by the Darien Telephone Company.

WESTFIELD, N. Y.—To accommodate its increasing business many extensions and improvements in its system are to be made by the Westfield Telephone Company, which will make the plant strictly up to date.

JERUSALEM, O.—The lines of the Jerusalem Telephone Company are being extended in many directions.

WASHINGTON, O.—Construction work on the system of the Washington Telephone Company is soon to commence.

WEST ALEXANDER, PA.—Many improvements in its plant are to be made by the Farmers' Mutual Telephone Company.

SCOTTSVILLE, VA.—The Albemarle Telephone Company expects to rebuild its line between Scottsville and Esmont.

TACOMA, WASH.—About $15,000 will be expended by the Home Telephone Company in the installation of a sub-station in this city.

ROSENDALE, WIS.—Considerable new construction work is to be undertaken by the Rosendale Telephone Company.

STRUM, WIS.—The Beef River Valley Telephone Company, which was organized last summer, and which has acquired the Strum exchange from the Osseo Telephone Company, has under consideration the construction of a number of new lines this year, also many improvements in its system.

CALGARY, ALB., CAN.—The city council has voted in favor of the immediate construction of a local telephone system. Some 4,500 telephones will be required. Address City Engineer Thorold.

EDMONTON, ALB., CAN.—It is the intention of the government, which is now building a line from Coleman to MacLeod, to build lines to Lethbridge, Taber, Medicine Hat, from Edmonton to Lloydminster, Wetaskiwin to Daysland, and from Lacombe to Stettler. Address Hon. H. W. Cushing, Minister of Works, Calgary, Alb.

DUTTON, ONT., CAN.—It is the intention of the Southwold and Dunwich Telephone Company to install its system at Dutton.

UNDERGROUND.

HASTINGS, MICH.—The Citizens' Telephone Company is to spend about $6,500 in underground work.

ALBANY, OREGON.—The Home Telephone Company is to place some of its wires underground in Albany.

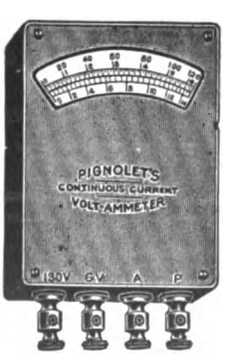
LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.
If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.
Does it pay to be informed? You ought to know.

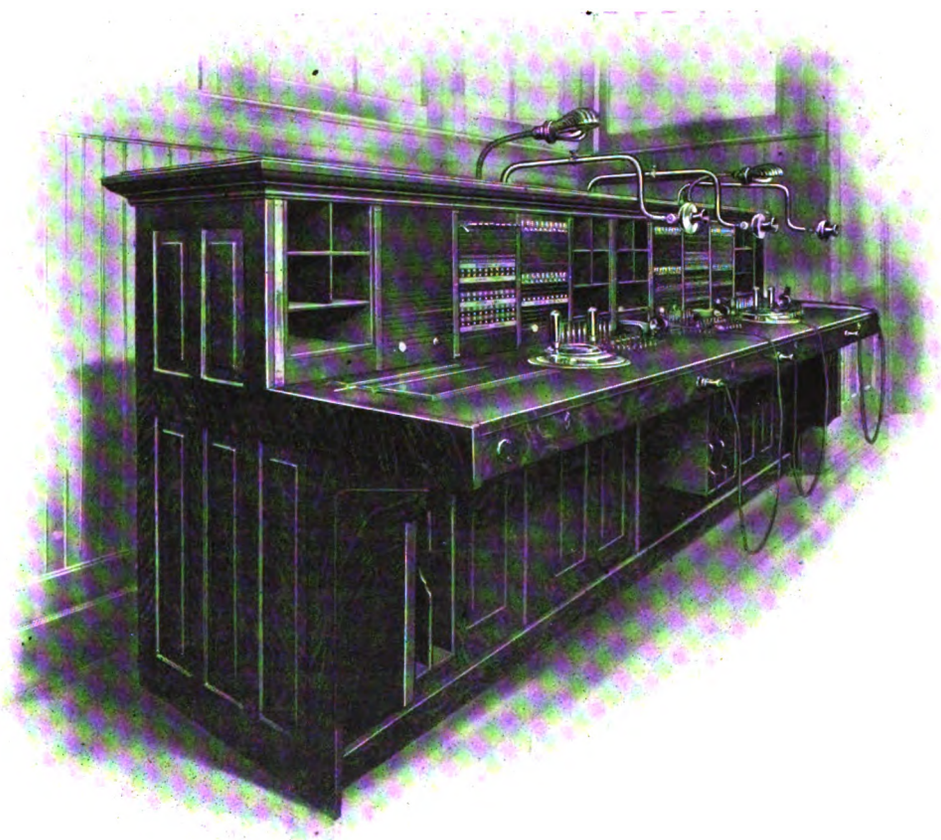
DEAN TELEPHONE APPARATUS

Dean Toll Boards



We build toll boards complete in every detail, of any size and to suit all requirements. Our toll positions are made up of standard Dean equipment and housed in highly finished Dean cabinets of quarter sawed oak or mahogany as desired.

At the present time we are installing the largest toll board in the country, one of 25 positions with many special features.

The above picture shows one of our three position toll board installations. We can fill your wants no matter how exacting your requirements.

The small toll boards turned out by the Dean Electric Company cannot be duplicated. They are made from the same selected material that we use in our largest boards. Our small toll boards get the benefit of the expense that necessarily has to be met in building large boards.

"STROMBERG-CARLSON"

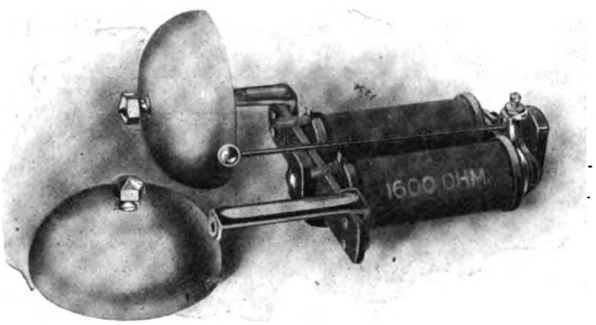
Compact Type and "Central Energy" Style

BRIDGING TELEPHONES

Are equipped with The "Stromberg-Carlson" Self Contained Ringer

The No. 6 type self contained ringer is distinctly a "Stromberg-Carlson" product. No design has ever approached it for simplicity, durability and efficiency.

It is the original form of self-contained ringer including **the armature and clapper rod adjustment independent of the ringer mounting plate,** thereby preventing any possibility of this adjustment being affected or changed by any variation or shrinkage of woodwork and disarrangement sometimes caused by rough handling in transit. The complete adjustment is actuated by a hexagon head screw located at bottom of ringer.



No. 6-c.—1600 ohm Ringer with gongs.

The permanent magnet is extra wide, of the finest grade magnet steel, tempered in dies in the finished form to insure accuracy in shape and size.

The illustrations of the spool heads show the fibre head cut away, taking the insulated wires through a hard rubber auxiliary head without touching the fibre and terminating them on brass clips securely mounted. This construction is the best possible protection for the winding and eliminates the common annoyance of "open" and disconnected coils due to corrosion of the wires. We use the best refined fibre in all our construction. **Inferior grades of fibre contain excessive chlorine which will attack copper.**

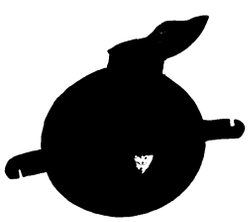
Construction of Spool Head. Hard Fiber Head with Auxiliary Hard Rubber Head.

All "Stromberg-Carlson" ringer coils are carefully and accurately wound by machine and thoroughly tested for resistance and circuit. We use the finest grade of **Single White Italian Tram Silk copper wire made in our own factory.** No German Silver wire is used next to core of ringer spools to increase resistance and necessitate **less amount of all copper turns of wire.**

The gong posts are adjustable, pressed and formed of sheet steel which is the strongest form.

The **Spun brass gongs** (not sheet steel gongs) develop clear and distinct maximum loudness of tone. Hexagon gong nuts permit fastening gongs securely, using wrench without disfiguring nickel plate finish.

The strong reasons for every point in this practicable design are our reasons why we say "Stromberg-Carlson" quality apparatus is what you want in your telephones.



Spool Head and Terminals.

Every part in a "Stromberg-Carlson" telephone is a practicable, durable, efficient piece of apparatus. **Every "Stromberg-Carlson" telephone contains apparatus made in its own factory** to meet the requirements in the best possible manner.

Telephones made well—work well indefinitely.

Write us at once and let us tell you more about Bridging Telephones.

THE WHOLE SECRET

of the success of the AUTOMATIC TELEPHONE SYSTEM lies in the elimination of the girl operators. It cannot be denied that most of the troubles and much of the expense in the manual system (where operators are used) can be charged to the operators themselves.

TRUE ENOUGH,

all operators are not faulty all the time, but some of them are at all times and all of them are sometimes. But "a chain is no stronger than its weakest link," and the average telephone subscriber judges the entire service by the poorest he has received.

IN THE AUTOMATIC TELEPHONE SYSTEM

the fallible human operator has been displaced by an infallible machine, a machine that produces perfect telephone service. With the human operator disappear her faults and her expense. The former are many, the latter not inconsiderable.

THAT IS WHY

the AUTOMATIC TELEPHONE SYSTEM, having no operators, can produce a perfect telephone service, prompt, accurate, absolutely secret, at a much lower cost than for inferior manual service. That is why it is a profitable investment to put your money into an operating company that uses the Automatic Telephone System. Our Automatic Telephone System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.

Installing a Philippine Telephone Exchange

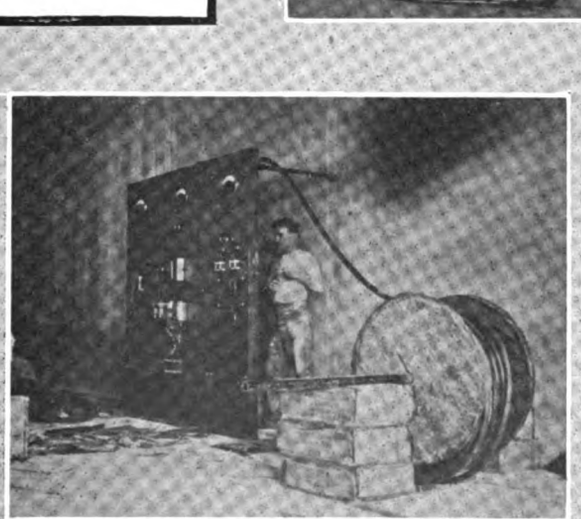
By William Frost.

Illustrations from photographs by B. H. Skinner.

WHEN starting out for a several thousand mile trip to install a telephone exchange in a foreign country, those who are chosen to take charge of the work are always considered specially fortunate. They have what is by many considered to be a long and happy vacation. This was the point of view taken by the friends of B. H. Skinner, S. H. Foley and B. C. Newly, who last year were sent to the Philippines to install modern equipment in the exchange at Manila. It was indeed a long voyage, as the ship touched at Honolulu, then went to Japan, and finally brought the telephone men into Manila Bay, twenty-nine days after it had started from San Francisco. The first thing necessary was to file an invoice at the custom house. All telephone goods are dutiable, and those in whose care they are placed must lose no time in getting the papers in the hands of the officials, as it is likely to be some days before the goods can be examined and passed.

The Manila exchange, in which the apparatus was to be installed, is located on the water front, and from its windows is obtained a view which is a decided novelty to those accustomed to looking out on the city streets which surround our larger offices in the United States.

For carrying on the work it was necessary to procure native helpers, and some very interesting conditions were met. The first work done in the exchange was the placing of the power board, which presented no features materially different from an installation of the same kind of apparatus in the United States. In the meantime the conduit was being placed outside. One of the photographs reproduced on this page shows the foreman and two of his native helpers. The office manhole beside which they are standing is below the river level. Except at low tide it is likely to contain from two to three feet of water—a most uncomfortable condition, which could not be avoided.



View From the Front Window of the Manila Operating Room.

Running a 750,000 c. m. Wire From the Reel Into the Manila Power Board.

An American Cable Foreman and His Two Helpers Standing Beside the Office Manhole.

Developing Long Distance Business*

By Frank Hart.

NATURALLY a good traffic manager will try to build up his business to the points with which most satisfactory connections may be obtained, not trying to induce subscribers to use lines to places where the lines are not yet in good condition, as it is very difficult to get business back after being lost through poor service. With the constant building of new toll lines and rebuilding of exchanges, however, the field which may be reached by the subscribers in any city is rapidly enlarged, and it is the duty of the traffic manager to see that the increase in business keeps pace with the advance of opportunities.

The method which has been used in Pittsburg for introducing new connections is based on the idea that it is least difficult to advertise new lines from a small city or town, as there are fewer people to reach. When a new line is opened up and in first-class condition free service is given for a few days from the smaller city to the larger one at the other terminal of the line. People in the small place take advantage of it and call up those in the larger city who are in the habit of calling them, thereby advertising the fact that there is a new line to talk over. It is found that some one will call up to ask the state of the weather, or some such unimportant things, but if the connection is satisfactory this does no harm, as he is likely to say a good word that will be beneficial at some future time.

The next thing done after the free service is over is to have one of the pleasant-voiced operators call up each subscriber who may have cause to use the line. She uses good judgment in getting some one in authority before she talks and is well posted as to what to say. Her talk runs something along this line. "Is this Mr. Jones? This is the Long Distance Department of the Home Telephone Company. I wish to inform you that our new lines to Allentown have been completed and we can give you first-class connections with Allentown, Scranton, Wilkes-Barre, Wayne and all other points in Eastern Pennsylvania. We would be pleased to have you try our lines the next time you wish to talk to any one in that locality." This will usually start people to asking questions about other points, so the operator has to be well posted as to all points reached. It might be useful to have her keep a record of all questions of importance asked her, turning this in to her manager. This will give very good material for the solicitor to work on later. This plan of having an operator call up the subscriber has been found to be very beneficial, effective and economical way of advertising.

Remarks

Subscriber's Comment

Call Made by

Fig. 2. Test call ticket used by toll operator on calls paid for by pass. Size 2¾ x 5¼ inches.

In addition to this verbal notification, a circular letter is used. It is typewritten and addressed properly to each person or firm to whom written. This letter tells what lines have been completed to various points, stating briefly anything of special interest, and should be as short as possible to insure reading. It is well to have something catchy in the way of advertising slips to enclose in each letter mailed by the company, no matter to whom it goes.

Newspapers, billboards, street cars and advertising of this description may be used at the manager's discretion, as this runs into money fast and will have to be governed by the conditions and the results expected.

The work of the solicitor follows the two plans just mentioned. In introducing new lines it is well to use the message pass and have it given out by the solicitor or manager. This system of giving free service works more satisfactorily in larger cities than the universal free service mentioned before for smaller cities, as the company is able to place them where they do the most good, and also to ascertain to whom the users talk. The message pass is worded as shown in Fig. 1. These passes are issued in book form, about twenty-five in each book, each having a stub attached. On the stub is placed the number of pass and the name of the person to whom it is issued. To go with this it is necessary to have a call ticket printed for the toll operator to fill in, and this is made out as shown in Fig. 2.

This slip or ticket when filled out gives the solicitor information to use on his return visit.

As most managers are familiar with the coupon system it will not here be discussed in detail, but the writer has developed a system for the handling of it which may be interesting. The first work for the solicitor to do is to induce the subscriber to use the lines, however little it may be, keep close record as to the amount they use, and as soon as the amount justifies such action call and sell him a small coupon book, increasing the size of the book as his business increases.

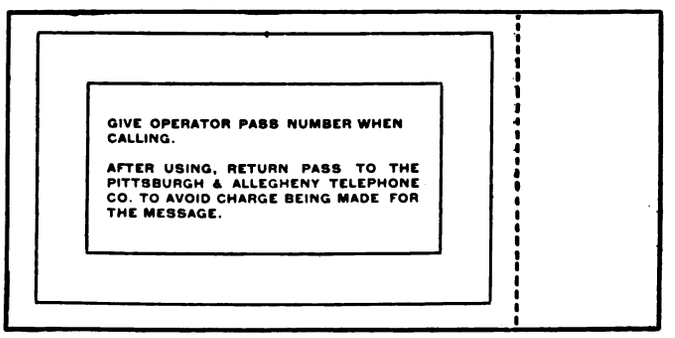
Fig. 1. Form for message pass used in building up toll business to newly connected points.



GIVE OPERATOR PASS NUMBER WHEN CALLING.

AFTER USING, RETURN PASS TO THE PITTSBURGH & ALLEGHENY TELEPHONE CO. TO AVOID CHARGE BEING MADE FOR THE MESSAGE.

Fig. 2. Back of message pass shown in Fig. 1, bearing directions for its use.

The writer has made out each month a statement covering the amount of toll coupons used by subscribers using more than one dollar per month. This statement covers six months, always dropping one month as the new month is added. In this way it can be easily seen whether each subscriber's business increases or decreases. This is valuable information for determining the size of the coupon books they should have.

Careful records are kept of the amount of traffic over each

*Abstract from an address delivered at the convention of the Pennsylvania Independent Telephone Association.

Digitized by Google

line—outgoing, incoming, through and the maximum day. These records are of great importance, as they show whether the company is getting the proper amount of business over its circuits and when new circuits are required. It thus gives a record which makes it possible for the company to spend the money it has to put out for improvements where it will do the most good.

Securing City Right-of-Way Permits

By O. R. Barnes.

GOOD faith and sincerity are the two most important factors in securing rights-of-way and holding them. If the agent possesses these qualities and understands his work thoroughly he will have very little trouble in obtaining what he goes after, but if he depends solely upon his ability as a social entertainer and upon his own personality he will meet with refusals on all sides. To the latter class of right-of-way agents belongs the fellow who by smooth talk and false promises entices a property owner to give his consent to the placing of wires and after obtaining the desired permission forgets all about the idle promises. This same agent will then have the effrontery to hand this concession in to the company as a bona fide agreement, thereby deceiving his employer, as well as the person who made the concession. The first knowledge the company obtains of the position in which it has been placed is likely to be due to the arrival of the man who gave his consent to the use of his property in a highly antagonistic mood because the promises made to him have been ignored.

Successful right-of-way work cannot be done along such lines. When promises have to be made they should be made with discretion and carried out to their fullest extent. One trouble and perhaps the principal reason why so many rights-of-way are unsatisfactory is because many agents lack the necessary knowledge of the telephone business. When an agent is sent out to get a necessary permission, say a guy-wire attachment, it is assumed that he knows what a guy wire is, what it is used for, and is able to concisely explain to the ordinary person, who is wholly ignorant of methods of telephone line construction, its great advantages in eliminating accidents by strengthening the construction. He should be able to weigh the value of the permission and reason with the property owner in a straightforward and honest manner, admitting many things, but omitting nothing that will help to capture the permission amicably.

Recognizing the hopelessness of obtaining permissions under false pretences recently caused one of the largest companies operating in the East to place all of its right-of-way work in the hands of its various construction engineers. Many telephone men thought at the time that this particular company was making a serious mistake. They could not possibly see how a construction man could talk any one into giving a permission. But it did not take long for the construction engineers to become tactful and in a comparatively short time they demonstrated to the satisfaction of the company that they could handle the public better and with less red tape than when they had to depend upon a separate department to secure for them the permissions necessary to carry on their work. The engineers now secure permissions more quickly and have fewer "come-backs" than under the old method, and this is accounted for by their clear insight into all the features of telephone business which apply directly to this class of work.

The construction engineer has many good points in his favor. He knows exactly what he wants when talking for a permission and can be explicit in his descriptions. Moreover he knows why he wants it and therefore knows its real value to the company. By talking to the man personally he is able to judge how the work should be performed to maintain his good will. If the man has any stipulations to make when granting the permission, the engineer knows and can say, without seeking advice from somebody else, whether or not the stipulations can consistently be adhered to and thus he cuts out considerable red tape. Should the engineer make any promises to the grantor he is in a position to see that the promises are promptly fulfilled by having their terms included in definite form in the specifications for the work.

There are many advantages to be gained by having the engineer secure his own permissions. It enables him to handle the construction work from start to finish without the assistance of a third party. To begin with, the engineer first makes a study of the situation and works up his layout; from his layout he makes a list of the permissions required; then he goes to the City Hall records and secures the names of the parties from whom he must get the permissions; then he looks their addresses up in the city directory; finally, with all this information in hand he goes and interviews his parties.

After securing the necessary permissions he makes a record of them and forwards them to the filing department; he then writes a set of specifications in which he describes how the work is to be performed by the various construction forces and calls their attention to any promises or stipulations made in securing the permissions in connection with the work. These specifications are returned to him upon completion of the work. He then goes over the work and checks it up to assure himself that it has been done to the satisfaction of all concerned. The specifications he files for future reference and the job is considered closed. The mere fact that the engineer checks the work when it has been completed shows that he realizes that the only way in which the company may successfully hold the permissions given him is to disarm criticism by discovering and rectifying as quickly as possible any poor work or errors made by the construction forces before those errors cause a complaint from the owner of the premises upon which the work has been done. There may have been only a trivial deviation made in carrying out instructions, having no special significance to the man performing the work, but still capable of causing protest from the subscriber and cancellation of the permission. Such a deviation is usually one which fails to make the construction unobjectionable to look upon.

There are many chances for errors to occur in the performance of construction work. Take, for instance, the work necessary to complete a junction box connection: First, the subway department lays the duct, etc.; second, the cable department pulls in the cable; third, the splicers wipe the connections and cut the box into service; fourth, the painter paints the cable, box and other exposed parts; finally, the wiremen run the wires to the box. Here are at least five chances for mistakes to occur. Now what is a better way for the company to discover mistakes and live up to its part of the agreement which says that the work will be done with care and that all damage caused thereby will be repaired at the expense of the company than by detailing a competent man to go over the work and check it up?

Successful rights-of-way can only be obtained by recognizing the limitations of the permissions as they are granted—much trouble and expense can be avoided by living within the bounds of those limitations.

F. P. FISH SUCCEEDED BY THEODORE N. VAIL AS PRESIDENT OF AMERICAN TELEPHONE & TELEGRAPH COMPANY.

FREDERICK P. FISH resigned as president of the American Telephone & Telegraph Company on April 30th, and was succeeded by Theodore N. Vail, formerly a director and member of the executive committee. Mr. Fish will again resume the practice of law, and will continue to act as one of the legal

Digitized by Google

advisers of the company. His successor, who is sixty-two years old, is one of the earliest men to become connected with the telephone business, having assisted in the organization of the original Bell company, with Gardiner G. Hubbard, to exploit the invention of Alexander Graham Bell. He was connected with this company, and was general manager of its successor, the American Telephone & Telegraph Company, until 1889, when he left the telephone business to engage in the construction of electric railways in Europe and South America, remaining in this business for about ten years.

At this same meeting W. Murray Crane, the junior United States Senator from Massachusetts, was elected a director and member of the executive committee. succeeding Alexander Cochrane, who resigned.

Rural Party Line Ringing Codes*

WM. SCHAFER, president of the Ida Telephone Co., Ida, Mich., has independently worked out a plan very similar to that contributed by Mr. John Smith. Odd numbers represent short rings, the number of rings being denoted by the position of the number in a regular sequence; even numbers represent long rings, for example, rings are as follows: 1, -; 3, - -; 5, - - -; 2, —; 4, — —, etc. Combinations can be made so that on a sixteen party line no number need have more than four rings.

The two right hand figures in the directory listing always represent the ring number, a cipher (0) being used when only one significant figure is needed, as 1507 denotes four short rings on line 15.

2 - -	13 — - - -	24 - - — -
3 - - -	14 — - - - -	25 - - — - -
4 - - - -	15 — - - —	26 - — - -
5 - - - - -	16 — - - —	27 - — - - -
6 - - - - - -	17 — - - - —	28 - - — — -
7 - —	18 - — -	29 - - - — —
8 - - —	19 - — — -	30 - — - —
9 - - - —	20 - — - -	31 - - - — -
10 - - - - —	21 — — - -	32 - - — —
11 — -	22 — — - -	33 — — — - - -
12 — - -	23 — — - - -	34 - — —

Table 1.

The Cape Cod Telephone Company, Hyannis, Mass., uses a code covering a heavily loaded line if necessary. It is shown in Table 1. Number 33 has not given good satisfaction and is no longer assigned.

C. W. Shimel, proprietor of the Shimel Telephone Company, Casey, Ill., devised eleven years ago an exceptionally simple, novel and interesting code which has given good satisfaction ever since it was put in service. The code is shown in Table 2.

The operator does not even have to memorize this code. To ascertain the number of long and short rings she simply divides the assigned ring number by 4. The quotient is the number of long rings, and the remainder the number of short rings.

In the directory the line or drop number is preceded by the ring number, so that should the drop number be 48 the first telephone on the line would be 548, the second 648, etc.

Central —	8 — —	12 — — —	16 — — — —
5 — -	9 — — -	13 — — — -	Etc.
6 — - -	10 — — - -	14 — — — - -	
7 — - - -	11 — — - - -	15 — — — - - -	

Table 2.

This will make clear the reason for beginning the ring numbers at 5, namely, to prevent the telephone numbers of regular lines from interfering with rural line numbers. The first 500 numbers are by this plan given over to regular local telephones. For exchange having a greater number of local telephones a letter may be used to indicate to which class a line belongs, as R for rural. Mr. Shimel was called upon recently to devise a code for a line having thirty stations and used the same plan up to 14, beginning over again at 15, after which a short ring was inserted. This, for purposes of computation, was assigned the value 10, this or its multiple throughout the twenties to be subtracted from the ring number before dividing by four. Thus, the code for various numbers may be arrived at as follows:

19 = 10+(2×4)+1 = - — — -
27 = 2×10+(1×4)+3 = - - — - - -
30 = 2×10+(2×4)+2 = - - — — - -

Experience has demonstrated that this code can be learned in a few moments, both by subscribers and operators, and mistakes seldom occur.

C. I. Stocking has not only an original ringing code, but also a special method of arranging and numbering rural lines. In one of his exchanges, for example, there is a 750 line local switchboard. All rural lines come to the last position. The first rural line is numbered 800, the first telephone on this line 801, the second 802, the tenth 810 and so on. The next line is numbered

Numbers on this side of the dotted line denote line number.	8 9 13		01 02 17	Numbers on this side of the dotted line denote the signal to be rung.

Table 3.

900, and the telephones designated in the same manner; the third line is numbered 1000 and similarly upward. The figures in the units, tens and hundreds position then denote the number of the line and the final numeral the ring number for the particular telephone desired. This may be made, perhaps, more clear by the diagrammatic explanation shown in table 3.

The signaling code to correspond to the ring numbers is shown in table 4.

1 — —	6 - - —	11 - — -	16 - — - -
2 - - -	7 - - - —	12 — - —	17 - — - - -
3 - - - -	8 — -	13 — - - —	18 — — -
4 - - - - -	9 — - -	14 - - — -	19 - — — -
5 - —	10 — - - -	15 - - - — -	20 - - — - -

Table 4.

Mr. Stocking has on no line more than twenty telephones and accordingly stops at that number, although his plan is capable of being extended should such action be desirable. He states that twenty signals "will give the average exchange manager a chance to load his lines as heavily as he likes."

H. M. Rounce, General Superintendent of the La Crosse Telephone Company, La Crosse, Wis., has a good word to say for the "Morse" code. An abstract from his letter gives the following information:

"The farm line is assigned some definite number of jack and drop if drops are used in place of bells. That number is then used as the two figures at the left of the complete number, if the drop number assigned has two figures. If the drop number has only one figure, place the Fig. 1 after the drop number. Thus if the drop number is 8, the number used at the left will be '81.' As the two figures at the right use the numerical number of the telephone counting out from the office or in the numerical order of the installation; the first nine numbers to be preceded by a cipher.

*Continued from previous issues.

Digitized by Google

"To illustrate: line No. 29 will appear in the directory as 2901, 2902, 2903 and so on up to the whole number of telephones on the line. Likewise line No. 8 will appear as 8101, 8102, 8111 8118.

"The usual Morse codes of ringing are used, but will be listed on the front of the switchboard and numbered to correspond with the number of the telephone in the series of figures used at the right of the number given in the directory number. If the code signals are arranged in numerical orders of five in each section, the operator will more readily pick out the code signal needed to ring the party called for. Operators will soon become used to the codes by number and will hardly ever look at the list of signals, especially of those parties who are called most frequently.

"We have been using this code system for some years and have not seen anything that we liked better. It fits well with the other numbers in our directory, as they are for the most part three figures followed by a letter to indicate the party on the line. (864-M.) We use the four letters A, C, M and R to indicate the proper key to use on selective party lines."

Depreciation*

By H. A. Douglas, General Manager Cedar Rapids & Marion Telephone Company.

DEPRECIATION is one of the most important factors in calculating earnings, and success or failure of telephone investments. There is a wide difference of opinion as to the proper percentage to be placed to the credit of this account, and the proper method of handling the account. Depreciation is the loss upon assets which are diminishing in value from year to year.

When Independent plants were first constructed, for about 500 to 800 subscribers, the cost per subscriber's line complete was about $55 or $60, including the switchboard. By adding to this plant, in the way of overhead cables and wires, additional switchboard and operators, it was possible to use this equipment and construction with fair results until the 1,000 mark was reached.

Then it was found necessary to entirely rebuild the system, in most instances placing cables underground in the business section, replacing the outside pole construction with heavier and longer leads, put up new cables and take down the old. The exchange, having outgrown its usefulness, must be discarded and an up-to-date common battery lamp signal multiple switchboard installed, with all the necessary expensive apparatus entering into its construction and operation. The old equipment, while not being worn out, if sold at all would only bring about 10 per cent. of its original cost. One reason for this heavy depreciation was due to the rapid improvements in telephone apparatus, which made second-hand equipment practically worthless. About the only parts of an old plant which could be used again were the poles themselves, and most of these must be changed or taken down and reset in another place, making them cost about two-thirds as much as new. If the shortened life had been taken into consideration, the cost could be figured at about the same as new. Overhead iron wire which had been in the air subject to the city smoke five or six years had been practically destroyed by corrosion and rust. Aerial cables that have been up for six or seven years are found in most instances to have depreciated to such an extent, from crystallization, improper handling and wear and tear, as to preclude the possibility of their being used again. The crystallization of the lead sheath is caused by the vibration of the pole line, due to wind and other causes, such as street car overhead construction when it is directly or indirectly attached to the pole line. In this connection it might be well to call attention to the very rapid deterioration of ærial cables crossing and attached to bridges. The vibration is so great as to cause an absolute destruction of an entire cable sometimes in as short a period as two or three years.

In order to properly house this new and expensive central office equipment, and insure it against fire, it was necessary to abandon the old quarters and construct in most instances a fireproof building as a central office. This entire rebuilding of the plant, for an exchange of 2,500 or 3,000, might cost, on an average, about $120 per line, so that it is safe to say that almost the entire original investment was lost through depreciation.

Depreciation enters largely into maintenance expense, and should be very carefully taken into calculations when dividends and net earnings are figured.

*Abstract from a paper read at the annual convention of the Iowa Independent Telephone Association.

The methods of ascertaining the proper amount to be placed to the credit of this account are many and productive of very different results as to the correct charge. Owing to different conditions, the difference in construction, and handling of the several properties, it is impossible to lay down invariable rules. The writer believes nearly all practical telephone engineers maintain that from 10 to 12 per cent. should be allowed under such conditions as have been mentioned.

When the plant is new the percentage is probably considerably less than 10 per cent., but as the construction grows old it increases from year to year until it is considerably more, and probably reaches as high as 15 per cent., so that if the actual depreciation charge were ascertained, and made from year to year, the rate would so increase as to become a burden upon the property, in the latter years of its operation, almost too heavy to bear. Reconstruction, due to rapid increase, enters very largely into this calculation, as the depreciation upon material taken down will average from 50 to 100 per cent., if it has been in service any length of time.

Whatever rule or method is determined upon should be very closely adhered to for several years in order to demonstrate its accuracy. If it is determined that the life of a plant is ten years, and therefore the depreciation 10 per cent., the following table, for which we are indebted to Keister's *Corporation Accounting*, will be useful:

For illustration: If our plant costs say $1,000, with a determined life of ten years, depreciation 10 per cent., we make the following deduction:

"That which expires in 'Life,' leaving no residual value, should be divided by the given number of years for that life upon its original cost." Therefore—

ON ORIGINAL COST.

Years—	1	2	3	4	5	6	7	8	9	10	
Depreciation, %...	10	10	10	10	10	10	10	10	10	10	= 100
Repairs	1	2	3	4	5	6	7	8	9	10	= 55
Total ann'l charge..	11	12	13	14	15	16	17	18	19	20	= 155

That which leaves a residue of value under any circumstances should be depreciated upon its diminishing value, and as our plants will leave a very material value at the end of ten years, we should consider carefully the following table:

ON DIMINISHING VALUE.

Years—	1	2	3	4	5	6	7	8	9	10	
Dep., %..	10	9	8.10	7.29	6.56	5.90	5.30	4.78	4.30	3.87	= 65.11
Repairs..	1	2	3	4	5	6	7	8	9	10	= 55
Total an.. charges.	11	11	11.10	11.29	11.56	11.90	12.30	12.78	13.30	13.87	= 120.11

This 120.11, with the residual value of 34.89 makes up the total charge of 155. It will be seen that depreciation on the original cost is therefore a writing off of the actual capital without having the residual value.

The writer believes that the general practice with most companies is to charge off to depreciation a sufficient amount of the surplus earnings to cover what per cent. they may decide as the

Digitized by Google

proper amount to charge to this account. This earning has, however, in nearly all instances been used in extensions and renewals, and does not represent actual cash. It is very convenient to be able to use this fund and then dispose of the excess earnings in this manner, without declaring additional stock dividends, but the question arises, is it the proper procedure?

The writer maintains that it is not. There is only one safe way in which it is possible to provide for the future, and that is to establish a reserve fund, and annually or semi-annually set aside to the credit of this fund a certain amount of the gross rental from each instrument in service, or carry to this fund a certain percentage of the total investment not less than 3 or 4 per cent. in actual cash, the same to be held as a reserve, to be drawn upon in extraordinary emergency or to reconstruct the plant in ten years. This reserve will stand as a protection against the investment. Securities would take a standing among the best, because they could be guaranteed by a cash backing that would insure their value.

If there are some who object to the cash reserve fund, the writer would suggest that a certain percentage of the amount of earnings expended on new work every year be charged to betterments, which would reduce the apparent earnings and at the same time keep down the maintenance and repairs expense, enable the company to make a good showing and fortify it in a manner against the future. If something of this kind is not done the inroads made by depreciation will put the balance on the wrong side of the ledger.

ARKANSAS INDEPENDENTS TO HOLD ADJOURNED MEETING ON MAY 20TH AT FT. SMITH.

WHEN the first meeting of the Arkansas Independent Telephone Association was held this year important matters relating to legislation were considered. At this time, however, many of the most active telephone men in the State were extremely busy and were unable to attend the meeting. It was therefore agreed that it should be adjourned and that all members should come together again on May 20th at Electric Park, Ft. Smith.

Attractive postal cards have been mailed by the association to all members, notifying them of this convention. Among the important matters which will come up at this meeting is the report of the committee which was appointed at the first meeting to look after the interests of the Independent companies before the legislature.

Prominent telephone men from other States will be present at the meeting, and the best men in Arkansas will tell of their experience in telephone work. Special invitations to manufacturers have been issued, and operating companies will have a first class opportunity to learn of the latest ideas which have been embodied in equipment and construction material. A. E. Boqua, secretary of the association, says: "Indications are that we will have a rousing meeting. We are extending invitations to all of our neighbors in Missouri, Texas and the new State of Oklahoma to assist in making this meeting one of the best ever held in the Southwest." Everyone who can possibly spare the time will no doubt find it to his advantage to make some sacrifice, if necessary, to attend this meeting and join in the proceedings, which are bound to have a good effect on the telephone business throughout the State.

THE SUMMER SCHOOL FOR ARTISANS AT THE UNIVERSITY OF WISCONSIN.

THE seventh annual session of the Summer School for Artisans, held under the direction of the College of Engineering of the University of Wisconsin, begins June 24, and continues for a period of six weeks.

Courses of study are offered in the following subjects:

ENGINES AND BOILERS.—Lectures and laboratory courses covering the theory, construction, management and testing of steam engines, boilers, gas engines and gas producers, refrigerating machines, etc.

APPLIED ELECTRICITY.—Lectures and laboratory courses covering the theory of direct and alternating current dynamos and motors, the operation and method of testing electrical machinery, batteries, transformers and other apparatus, photometry and calibration of instruments.

MECHANICAL DRAWING AND MACHINE DESIGN.—Elements of applied mathematics, courses in mechanical drawing and machine design adapted to the preparation of the students.

MATERIALS OF CONSTRUCTION, FUELS AND LUBRICANTS.—Lectures on the properties of materials accompanied by laboratory tests; lectures on fuels and lubricants with laboratory tests on the heating value of coals and efficiency of lubricants under various conditions.

SHOP WORK.—Practice with hand tools, wood and metal working machinery, and in blacksmithing and pattern making.

MANUAL TRAINING.—Lectures and laboratory courses adapted to the requirements of manual training teachers.

The entire laboratory and shop equipment belonging to the College of Engineering is used by the students in the Summer School.

The requirements for admission do not extend beyond a working knowledge of English and arithmetic, but the policy is to allow a large amount of individual work so that the student may take advantage of all the preparation he has obtained.

This school offers to those unable to take a regular four years' course an opportunity of obtaining a working knowledge of the methods of testing and the use of instruments, together with such theoretical principles in each case as the nature of the subject and the preparation of the student may permit.

Correspondence students have found this school of value in giving an opportunity for laboratory practice along the lines in which they have had theoretical instruction, thus fitting themselves more perfectly for practical work.

A bulletin describing the work of the School for Artisans in detail will be sent on application to FREDERICK E. TURNEAURE, Dean, College of Engineering, Madison, Wis.

NEBRASKA VOTERS AT CRETE COME OUT STRONGLY IN FAVOR OF INDEPENDENT TELEPHONES.

ON TUESDAY, April 16th, after the proposition of the Independent telephone company which desires a franchise at Crete, Neb., had been thoroughly set before the people, a special election was held.

Of course there had been the usual amount of vigorous opposition by the Bell company prior to the date of the election, but when the matter was put to the test the desire of the people for the service of the Independent company and connection with the thousands of other Independent telephones in the State was clearly shown by the result. The vote stood 384 in favor of granting the franchise, while only 87 voters recorded their opposition.

CITIZENS OF SENECA, KAN., PREFER ORGANIZING NEW COMPANY TO RENEWING BELL FRANCHISE.

ALTHOUGH originally served by a small Independent company, the people at Seneca, Kan., have for several years past been using Bell telephones, which were installed after the first exchange had been bought up by the Bell company. Recently the franchise expired and the company has applied for an extension, although at this time the city mentioned several conditions which must be observed before the new franchise was granted.

Most of these conditions were readily agreed to by the company, but in the matter of rates there was a decided difference of opinion. In many of the neighboring towns where there are Independent companies the rates are much lower than in Seneca, and the council believed that the company before being granted a new franchise should agree to reduce its prices for service to the same figures which obtain in neighboring localities. When this was refused the citizens immediately considered the organization of an Independent company, and it is understood that many subscriptions for stock, contingent upon its organization, have been taken.

QUERIES

DIFFERENCE BETWEEN NOISE INDUCED BY HIGH VOLTAGE WIRES DURING DAY AND NIGHT.—(854.)

We are operating a telephone system in a city where the power company has an all day service as well as at night. One of our leads parallels the high tension leads of the power company for about a mile and we have induction noises on the lines thus paralleled. We notice that this noise is greater at night than in the day time and cannot understand why this should be the case as the voltage on the power leads is the same all of the time. Will you kindly explain the reason for this, and also tell us how we can get rid of this noise? H. G.

The reason you experience more trouble from induction at night than in the day is evidently due to the fact that there is a greater consumption of current at night owing to its use for lighting, etc. The amplitude of the field occupied by lines of force around an electrical conductor increases and decreases according to the amount of current flowing through the conductor, irrespective of the voltage. As by increasing the load a greater amount of current is caused to flow in the line and consequently causes a wider spreading of the lines of force, giving incidentally a greater number in a given area. As induction is due to the cutting of these lines of force, as explained in Query No. 821, issue of February 9, 1907, it will readily be seen that a greater number of lines of force are cut and naturally a greater induced current is set up in the telephone line, thus causing a more pronounced noise in the telephone instrument.

As a remedy for this we would suggest getting as far away from the power lead as is possible and also transposing your lines so as to break up the inductive effect as much as you can.

INSTALLING AND TESTING CONDENSER IN MAGNETO INSTRUMENT.—(855.)

You have shown us so many easy ways out of trouble in the past that we hesitate to ask any more favors, but as we are again "at sea" on a matter we have no other recourse but to inflict ourselves upon you once more. We wish to assure you, however, that we appreciate your kindnesses in this relation very much and only regret our inability to suitably reciprocate.

About a year ago we equipped one of our lines with telephones having condensers installed so as to allow central to ring along the line even though some of the receivers might be off the hooks. These instruments have given us great satisfaction and we desire to equip the instruments on our other lines also in this way. Will you not favor us with instructions as to the correct manner of accomplishing this work; also as to how we may test the condensers in the instruments now in use to determine whether they are in proper condition or not? H. S. G., Neb.

It is an easy matter to install condensers in the other bridging

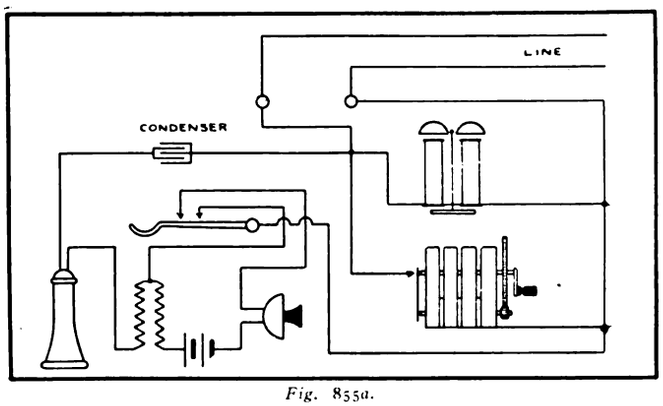

Fig. 855a.

telephones on your system. Fig. 855*a* shows the circuit of a telephone with a condenser installed in the receiver circuit for the purpose stated in your query. All that is necessary is that you open one side of your receiver circuit and cut the condenser in series with it.

If the condensers in your instruments are open circuited the trouble will soon make itself apparent, as you would then be unable to hear on the instrument thus effected, but should it become short circuited the trouble would not show. If you are in doubt as to whether any condenser is short circuited or not you can readily determine its condition by endeavoring to ring a buzzer with dry cells through the condenser. Connect a buzzer to one side of a dry battery and touch the other two terminals to the terminals of the condenser. If the condenser is short circuited the buzzer will operate, otherwise it will not.

A method of testing a condenser which is very useful at a

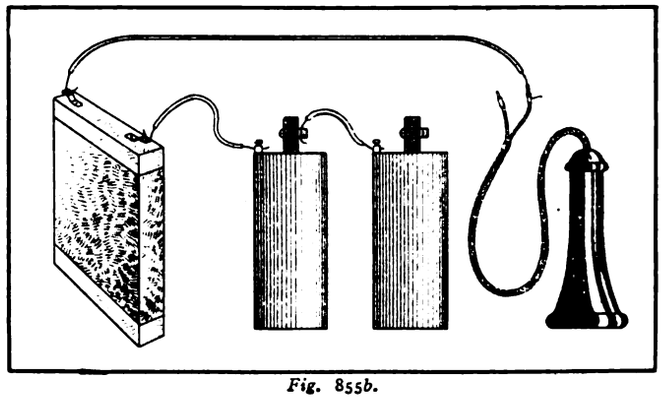

Fig. 855b.

station visited when the trouble man may not happen to have a buzzer is illustrated in Fig. 855*b*. All that is necessary is to connect the instrument battery, cells being joined in series, with one terminal of the condenser. The other condenser terminal can be connected by a short piece of wire to one side of the receiver, removed, with its cord, for making this test. While listening at the receiver touch its free terminal to the free terminal of your battery. You will hear a click. Then break the connection and make and break it rapidly several times in succession. If your condenser is good the only loud click you will hear in the receiver will be when you first make the contact. This is due to electricity flowing into the condenser to charge it to the same difference of potential as exists between the terminals of the battery. Once it is charged, if good, only an unappreciable current, due to what is sometimes called a "soaking in" effect, will flow when contact is subsequently made, completing the circuit.

If the condenser is poor—that is to say, short-circuited—you will hear a succession of loud clicks, one occurring every time the circuit is made, due to a direct flow of current through the condenser, which in this event takes place in the same way as through any other closed metallic circuit. The principle shown in the last figure may be utilized for testing the condenser installed in the instrument, without removing it or the receiver, by suitably connecting the battery.

TAKING STORAGE BATTERY OUT OF SERVICE.—(856.)

We have a private branch exchange system which we are going to take out of service for a few months and desire to have the battery elements in good shape when we are ready to operate this P. B. X. again. We understand there is some special way recommended for abandoning a storage battery, but do not recall exactly what it is at present. Will you kindly inform us on this point? H. H., Indiana.

To leave the plates in the best condition it is customary to charge the battery to its greatest capacity at the normal rate, then siphon off the acid into thoroughly clean carboys and immediately refill each cell with water. Then discharge the battery at the normal rate down to less than one volt per cell, after which remove the plates from the water and allow them to dry. After the jars have been thoroughly cleaned and dried, the plates may be again placed in them and stored in some dry, clean place until you have further use for them. The acid which is siphoned off may be used again.

THE FOREST SERVICE INVESTIGATIONS OF METHODS OF CREOSOTE ANALYSIS.

CAREFUL and elaborate investigations of the methods of preserving wood have been carried on for some time past under the direction of the Forest Service division of the United States Department of Agriculture. The experiments which are now under way have a very direct and material interest to telephone companies, which are such large users of certain kinds of wood in the form of poles, cross arms and pins. Good timber for the manufacture of these supplies is acknowledged everywhere to be rapidly growing scarcer; existing supplies are found more and more remote from transportation facilities and are consequently more difficult to bring into the market, and so more expensive. This scarcity of timber is bound to increase as time goes on, and the only way in which telephone companies can meet the situation is to begin at once, if they have not already done so, to consider much more carefully than they have in the past the importance of methods for preserving the existing supplies after the timber comes into their hands.

Gifford Pinchot, Forester of the United States, calls attention in a recent letter to the efficiency of coal tar creosote as a wood preservative. Unfortunately in the production of this material at present the coals used present a great variety in composition, and there is a considerable difference in the various methods of preparing the substance on a commercial scale. As the creosotes of different compositions are believed to have different values as preservatives, it is very important that a company desiring to obtain the best results should be able to specify the exact proportions of the various constituent compounds which will insure the longest life to its wooden supporting fixtures. The only way in which the necessary facts to be used in such specifications may be determined is by an analysis of the different compounds, and experiments which will show their effects on the material in actual service.

Up to the present time no very large amount of study has been directed to perfecting methods of creosote analysis. The Forest Service, however, is now carrying on investigations of these methods. The most important part of creosote analysis is the fractional distillation, which gives an approximate idea of the relative proportions of the most important substances in the coal tar oil. There have been advanced different opinions by scientists who have studied the subject as to the best methods of carrying on this process. Some recommend a retort, others a flask, as a distilling vessel, and the proper temperature at which the fractions should be taken off has been the subject of varying and conflicting recommendations.

The Forest Service is very desirous of getting criticisms and suggestions of all users and manufacturers of creosote who have made careful observations of the results of different methods of analysis, showing the practical value of each process. With this object in view it has prepared a bulletin which gives a detailed account of the methods which were adopted in its experiments. Apparatus and methods used in the analyses are fully described, and the results obtained are indicated. Copies of this bulletin are available for distribution and may be obtained by those who wish to have it as a means of directing their own investigations or co-operating with the department, by writing to Gifford Pinchot, Forester, at the Agricultural Department in Washington.

This investigation is of such importance to the industry that all telephone engineers who have investigated the subject will see a distinct advantage in offering their hearty co-operation to the Forest Service in the important work in which it is now engaged for the benefit of telephone companies.

FOLLOWING UP COMPLAINTS.

PROBABLY there is no work for which a well regulated telephone company receives so little direct recompense for the efforts expended as that of following up service complaints. In spite of this the experience of every telephone manager who has been willing to give careful consideration to the matter is almost sure to have been of a nature to cause him to admit that all the thought, care and time put into this work have been far from wasted. In the long run they almost invariably do produce results which justify careful attention to this detail.

Of course, there is the "kicker" who must not be left out of the reckoning. The interesting individual who belongs to this class seems to think that the slightest error or inattention of an operator or the failure of a line to be at all times at his disposal and capable of giving most efficient service is a proper reason for calling up the highest official of the telephone company whom he can reach and making his protest in most vigorous terms. Still, perhaps it is true that, unlike a poet, the average kicker is made, and not born, and the telephone company must share the responsibility for his existence.

The telephone subscriber is not very adept at classifying troubles. Out of order is the only term that interests him. If his line is broken by a falling tree, or there is a poor contact in the relay at the central office, all he knows is that he is unable to get the operator. If enough of these things happen to occur in a week he makes a complaint of poor service.

After this, if he is the right sort of a man, he puts the matter out of his mind for a few days. Here is where the follow up idea comes in, and may be worked out to the advantage of the telephone company. When a trouble is cleared on which a complaint, as distinguished from a mere report, has been made by the subscriber, it is found to be an excellent plan to have some competent person explain in considerable detail the cause of the trouble, telling where the responsibility is placed, and explaining why the telephone company is subject to such difficulties in operation as those which have caused the complaint in question.

The result of this policy is two-fold. In the first place, it satisfies the subscriber that interruptions in his service, while they no doubt represent annoyance to himself, are equally obnoxious to the company from the most selfish point of view, and that it is bound to use every reasonable effort to limit their occurrence, and clear them up rapidly when they do make their appearance. The personal factor in this method of handling the situation operates equally to the company's advantage, as the attention the subscriber receives causes him to feel thoroughly satisfied with his treatment as an individual. In other words, he is put in the attitude of a friend between whom and the telephone company there have been some slightly unsatisfactory relations, which he will be glad to overlook on learning their true cause.

There is a limit to all things, and the satisfactory working of this plan depends to a considerable degree on a good operating and maintenance department. It would never do to follow up complaints from the same man too often!

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

CONDITIONS IN LOUISIANA FRANCHISES.

Being one of your subscribers, would thank you in advance for the following information: Our company applied to the town council for a franchise. We met with objections, as the town was supplied both with local and long-distance service; but, after much opposition, we were given a franchise, provided our company had telephone and switchboard in operation within ten days. We installed telephones and lines, but the railroads failed to bring our switchboard. We have not received, up to date, our switchboard, and the town issued an injunction against us proceeding any further in the town. Now, has the town the right to limit us to ten days? Also, had the mayor the power to enjoin us without authority of the Board of Aldermen? Have we a right for damages against the town?

W. P. TEL. CO.

THE law in Louisiana provides that telephone companies may construct and maintain lines when necessary along all State, parish or public roads, or public works, and parallel to any of the railroads of the State, and along and over the waters of the State, provided ordinary use be not obstructed, and along the streets of any city, with the consent of the council or trustees thereof. Revised Laws, 1897, section 696. According to these provisions of the statute the consent of the city council is necessary before you can construct your lines in the city streets. It is generally held that where a municipality's consent is necessary, it may be granted on such terms as the charters provide, and you having obtained a franchise on condition that your telephones and switchboards were to be in operation within ten days, it seems that the council could insist upon it. We do not think, however, that the mayor would have any right to institute injunction proceedings without the direction of the Board of Aldermen. If the suit was begun against you without authority, you would be entitled to sue upon the injunction for your damages.

WHEN RAILROAD COMPANY IS LIABLE FOR ITS INDEPENDENT CONTRACTOR'S INTERFERENCE WITH TELEPHONE LINE.

THE Batesville and Winerva Telephone Company, operating a line through the counties of Independence, Izard and Baxter in the State of Arkansas, constructed its lines on the north or east bank of the White River in 1901. Later in the year the White River Railway Company began the construction of its railway in the same locality. The telephone company alleged that the railway company, in the construction of its line, wilfully and unlawfully cut down and dug up about 560 of the telephone company's poles and tore down its wires for the greater part of the distance between Penter's Bluff and Syllamore in Independence County. It brought suit against the railway company for six thousand dollars damages. The defense of the company was that, if the telephone line was injured, it was the act of one Reynolds, who had a contract with the railway company for the construction of its railroad, and for whose negligence, or that of his sub-contractors, the railway company was in no way responsible. The railway company further defended itself by saying that it had surveyed its line of road and staked off its right of way before the telephone company built its line.

Passing on the case, the court held that neither of the defenses of the railway company was good. In the first place, the proof showed that the work contracted for by the company would necessarily result in injuring the telephone line. In such case the law would not excuse the principal from liability for the negligence of its independent contractor or sub-contractor. On the second ground of defense, the court held that the making of a survey gave the railway company no right in the land on which the telephone line was located, even if the line was built after the survey. It was not shown when the railway company acquired its right of way. A judgment of $550 for the telephone company was sustained. White River Railway Co. vs. Batesville and Winerva Tel. Co. (Ark.), 98 S. W., 821.

AMOUNT OF PROPERTY WRONGFULLY APPROPRIATED IS IMMATERIAL.

IF a telegraph company, over the objections and against the protest of the land owner, entered upon his land and dug holes and erected telegraph poles there without authority of law, the land owner is entitled to at least nominal damages, even if he does not show any actual damages. If the telegraph company desires to condemn land for its poles and wires a mode of determining damages is prescribed by law; but, if without any authority of law, it enters upon and appropriates land without any condemnation and against the will of the owner, it becomes a mere trespasser, and is liable in damages for the violation of the owner's right of property. Even if a very small amount of property was appropriated, the company would be liable if it attempted the appropriation whether it admitted liability or not. Postal Teleg. Cable Co. vs. Kuhnen (Ga.), 555 S. E., 967.

SILENCE GIVES CONSENT.

WHERE a woman stands by and sees her husband give a telephone company the right of way over her land and says nothing until after the building of the line is accomplished she is held to have consented to the granting of the right of way. This was the holding of the Circuit Court at Meridian, Miss., in the case of Mrs. Helen E. Perry vs. the Cumberland Telephone and Telegraph Company, in which she sued for $3,700 damages for trespassing on her property in putting up a telephone line. The plaintiff's testimony showed that the land belonged to Mrs. Perry and that the right of way was obtained from her husband while she was present. Mrs. Perry, herself, testified that she did not give her consent to the building of the line. A pole was even put in her dooryard. The court held that plaintiff, being present when the right of way grant was signed, should have objected then and not have waited until money was spent on the line. On this ground judgment was entered for the telephone company.

MUST REMOVE TELEPHONE POLES.

AT Newburg, N. Y., the Supreme Court, sitting without a jury, decided the case of George Beyer vs. the State Line Telephone Company. The company had erected its poles and strung its wires along the highway in front of Mr. Beyer's property without his permission, and he brought suit to recover possession. The company contended that it had the right to place poles in front of the property without the owner's consent, but this contention was overruled by the court, which held that the company must remove its poles.

IN THE OPERATING FIELD

VERMONT AND NEW HAMPSHIRE ASSOCIATION EXPOSES "FAKE" INDEPENDENT COMPANIES.

G. W. BUZZELL, secretary of the Vermont and New Hampshire Independent Telephone Association, writes concerning recent events in his territory as follows:

"It appears from the heading of the following item that the Bell Telephone Company would like to make people think that it is operating Independent telephones. The enclosed item was clipped from the Montpelier *Daily Argus* of April 22, and I wish to state that part of this item, the heading in particular, is far from being true. The telephone companies named in this item are not Independent companies in any sense of the word.

"The Plymouth and Campton Telephone Exchange is a sub-licensee from the old parent Bell company. The Pike Telephone Company is a sub-licensee of the New England T. and T. Company; the Franconia Telephone Company is a sub-licensee of the New England T. and T. Company, and the balance are all Bell, pure and simple. I wish to make this correction in this item, as I understand it, so that the people will not be fooled by these sub-licensee companies, calling themselves Independent.

"The following is the item in question:

INDEPENDENT TELEPHONES.

PLYMOUTH, N. H., April 20.—The White Mountain Telephone and Telegraph Company, chartered by a special act of the last New Hampshire Legislature, was organized here with a capital stock, fully paid in, of $100,000.

The company has absorbed the Plymouth-Campton Telephone Exchange Company, with 100 subscribers; the Pike Telephone Company, with 300 subscribers; the Franconia Telephone Company, with 200 subscribers; the exchange of the New England Telephone Company at Woodsville, N. H., with 500 subscribers; the Bradford, Vt., exchange of the New England Company, with 100 subscribers, and some other minor lines of the New England Company in that section of Vermont.

The officers of the new company are: Directors, Gen. George H. Adams, of Plymouth; Nelson Bailey, of Wells River, Vt.; Ora A. Brown, of Ashland, N. H.; Allen Hollis, of Concord, N. H.; Charles J. Ayer, of Plymouth, and Henry W. Herbert, of Rumney, N. H. President, Allen Hollis, of Concord; treasurer, Davis B. Keniston, of Plymouth; general manager, Walter I. Lee.

"There is another deal of this kind reported on in Essex, Caledonia and Orleans counties, Vermont.

"The concern has been recently organized under the name of the Passumpsic Telephone Company, with 10,000 shares of stock at $25 each—a bait for the small investor. Why is the Bell disposing of its lines in this way? It looks as though it would rather have one-half the appraisal of its plants in money and then hold a majority of stock in the new company and let the other fellows do the fighting."

TELEPHONES IN THE FAR EAST.

CONSUL GENERAL D. F. WILBER reports that only one company is engaged in furnishing Singapore with telephones, and it has about 1,500 instruments. In Penang and in the Federated Malay states the government operates the systems. The instrument used is of the magneto type and is made in Antwerp, Belgium. Of these, Penang has 500 and the Federated Malay states 300. Singapore buys about 250 telephones annually, Penang 75, and the Federated Malay states 50. Thus far the service in Singapore is said to have been very unsatisfactory. Quite a large sum of money is being expended in improvements, placing wires under ground, rebuilding overhead lines, and other work.

INDIANA CONVENTION TO MARK TRIUMPH OF INDEPENDENTS.

THE second annual convention of the Indiana Independent Telephone Association, to be held in the Hotel Claypool, Indianapolis, May 15-16, will be the scene of some remarkably interesting proceedings. The telephone men are asserting with confidence that the meeting will mark in an unmistakable way the victory of the Independents in the Indiana field. Great interest is being taken in the convention, not only by Indiana telephone men, but by those of adjoining states, because it will be distinguished by the thorough and serious consideration of what will probably be an authoritative proposal by the opposition interests in the State. These relate to the plan of taking over some of the Bell company's exchanges and arranging with the representatives of that company for a division of the long distance business in consideration of the closing of its local exchanges.

There is apparently no doubt of the authenticity of the proposition for the deal by the Bell people, and while the Independents declare that it is nothing more or less than a distress signal, they are willing to submit the proposition to the State Convention, and if ratified will consider the terms of agreement. The Bell people do not deny having made the proposal, but say their intention and hope in doing so is to forestall future legislation, which is certain to enforce an interchange of business. They say it is advisable, therefore, for the rivals to get together before the law steps in and compels them to do so whether they are willing or not.

The executive committee of the Indiana association held a meeting in Indianapolis on the 25th ult., and discussed every phase of the proposition, and decided upon certain recommendations to be presented to the convention. The committee has not made public all of its recommendations, but it is learned from a reliable authority that the Independents will demand a surrender of all the local exchanges in the entire State with the possible exception of Indianapolis and Evansville; that the offer of 15 per cent. of all tolls originating on Independent lines will not be accepted, but instead 25 per cent. will be demanded. The Independents must also be left free to build new Independent toll lines where the Bell lines are not sufficient. The Independents say they now have every advantage, after a long fight, costing both factions millions of dollars, and while wishing to be fair with their adversary, they will not yield a particle of the advantage gained.

The programme for the convention has not been completed, but it is expected that the greater portion of the afternoon sessions will be devoted to the discussion of the proposition made by the opposition interests. Many prominent telephone men from all over the country will be present, and give their attention to the important matters to be considered.

WHEN IN DOUBT

About any question or idea, technical, legal or otherwise, consult AMERICAN TELEPHONE JOURNAL'S *staff of telephone men. Each is an authority in his particular line. Your salary-drawing ability lies not so much in what you have memorized as in knowing how to learn.*

The Query Department of the JOURNAL *is maintained to help you and all other telephone men, no matter what positions they occupy. Therein lies its value. Increase this value and your own, too, by asking practical questions whenever they occur to you. Tell your troubles to the Editor,* AMERICAN TELEPHONE JOURNAL, *100 William St., New York, and he will help you solve the problems.*

"Information?"

QUESTIONS SHOWING THE DEMANDS MADE BY THE CURIOUS PUBLIC UPON THE KNOWLEDGE, TACT AND TEMPER OF A TELEPHONE OPERATOR IN A TYPICAL CITY EXCHANGE.

IN a certain telephone exchange which we will call Arcadia, because that is not its name, and because it is a very poor name for any telephone exchange, the information bureau clerks have kept a book of curious questions that have been asked over the wire. Arcadia is an exchange of about 10,000 telephones in a city of about 125,000 inhabitants. All the queer inquiries have not been set down because the information desk with two operators has been too busy to enter them. Many of the questions were answered, some were referred to telephones that should have been called, while others simply had to be passed over as best they could, being impossible of solution by human agency. The items that follow are not selected, but are put down exactly as the information bureau wrote them out, beginning in the year 1904.

"Information! Do you take orders to cart trunks around town?"

"Please tell me if the (S. S.) Baltic has arrived in port yet."

"Information! What is the night boat going out with a black flag on it for?"

Labor Day. "What time will the *Evening News* be printed today?"

Same day. "If a special delivery letter comes for me today will it be delivered?"

"Information! Give me the nearest telephone to a cab man."

"Information. Give me the number of the man on the hill in Southport with the flagstone walk around his house."

"Who carried the insurance on the broom factory?"

"Which road do you take to go to Mr. Smith's house in Northtown?" (A suburb about 10 miles distant.)

From a lady who is engaged in putting up pickles: "Information! How many tablespoonfuls of spice does it take to make an ounce?"

At 5:25 P. M. "Will you guarantee to deliver a message to the New York postoffice by 5:15 P. M.?"

"I've had my telephone two quarters, can you tell me how many calls I've had?" Referred to business office.

"What packing house is down on the water front opposite the railroad tracks?"

"I want to order some sweet crackers. Can I get them at the Philadelphia grocery?"

"Give me the agents for the next president of the United States on Main St." (Wanted Democratic headquarters.)

"Give me Mrs. Jones on B Street, opposite the church."

"Information! They gave me the name, but I forgot. It begins with H. How am I going to find it?"

"Is there a telephone at the corner of Franklin and Wood Sts., in Reading, Pa.?" (Only about 200 miles away.)

"Give me the C Street telephone."

"Will you please tell me if there is going to be a game between Columbia and any other team tomorrow?"

"I sent a message this afternoon from Albany to Springfield. Can you tell me if it has been delivered?" (Two cities that were miles away from Arcadia.)

"Information! I want this put on file! Central don't give me any kind of service. I ask for a number and she tells me 'busy.' Then I go down the street and call again and get it all right. I have a cold in my head and can't hear very good and have a sore throat also."

From the leading hotel: "Hello, central, send up a glass of whiskey to Room No. 6, will you?"

"Give me two numbers on C St., one is upstairs and the other down."

"Give me the number of the telephone in the farm house on the Southport road, going out from County street."

"Say! Do you remember what the number of the Elks' telephone was last year?"

"Information! How many acres in the Common?" (A park near the center of the city. This was looked up, for the same question has been asked several times since.)

"Hello, central, please send me the bill of fare."

"Can I pay my telephone bill today?" (The company would be pleased.)

"Information! Can I telephone to Europe? Can I telephone from New York to Europe?"

"I just received a special delivery letter. Did they send it from the Southport postoffice, or the Arcadia postoffice?"

"You tell Mr. Brown in the Horseshoe Building that I am on a job next door, and I want him to come up and see me."

"Which way is the parade coming tonight?"

"Is Tuesday (Election Day) a legal holiday?"

"Hey, Information, I'd like to get a whack at you." (Now, what do you think of that?)

"I think we subscribers should be charged 5c. for 15 minutes, instead of 15c. for 5 minutes, don't you?"

ILLINOIS INDEPENDENTS TO HOLD BIG CONVENTION AT SPRINGFIELD.

MAY 14th and 15th are the dates set for the convention of the Illinois Independent Telephone Association at Springfield, Ill. This is to be a big meeting and a lively one. Mr. C. B. Cheadle, secretary of the association, in referring to the meeting in a recent letter, states that "there won't be much oratory or fireworks, but a whole lot of live discussion. Miss Barnes, chief operator at Springfield, will conduct a school of instruction for operators. Mr. John F. Casey, traffic manager of the Kinloch Telephone Company of St. Louis, will give some exceedingly practical talks along the line of installation, care and management of switchboards."

Many other good features have been arranged for. A large attendance is expected and many of the best men in the State are to join in making the meeting a record breaker. Every one that can possibly do so should arrange to be at this meeting.

LOUISIANA STATE BOARD OF APPRAISERS INCREASES TELEPHONE ASSESSMENTS.

AT the completion of the session of the State Board of Appraisers for the State of Louisiana, April 18, it was found that the telephone property owned by the Cumberland Telephone and Telegraph Company had been materially increased in valuation. Not only were the assessments on real estate increased by very large sums, but the assessments on strictly telephone equipment were raised by large percentages. For instance, the assessment on the exchange in New Orleans was increased by 25 per cent. Poles on toll lines were assessed at $100 per mile, an increase of $40 per mile over the assessment of last year. Copper wire was raised from $30 to $50 per mile, while the assessment on iron wire was doubled, making the present figure $10 per mile.

WEST VIRGINIA INDEPENDENTS TO MEET AT WHEELING.

ON May 9th and 10th the members of the West Virginia Independent Telephone Association are to hold their annual convention at Wheeling, W. Va. Men from all over the State will take part in the discussion of important matters connected with the carrying on of their business, and take up plans for the more thorough development of the Independent systems of the State. Among those who will be present are President W. C. Handlan, of Wheeling; E. K. Hertford, of Charleston; John A. Howard, of Wheeling; F. B. Hall, Rochester, Pa.; Frank Hart, Pittsburg, Pa.; J. Walter Barnes, Fairmont; Lon H. Hutchinson, Huntington; J. W. Downs, A. C. Davis, of Parkersburg; T. B. Lee, of Pittsburg, Pa.

TELEPHONE PATENTS

TELEPHONE SYSTEM.

Elmer R. Corwin, Chicago, Ill., patents (No. 845,056; dated Feb. 26, 1907; filed Oct. 20, 1906; serial No. 339,851) a telephone system.

This invention relates particularly to common battery telephones in which the transmitter is in series with the line and an impedance coil through which the battery current is fed to the transmitters. The inventor's aim has been to eliminate the click of the subscriber's receiver, when the hook switch was operated, due to the impedance coil forcing a portion of the current through the receiver. He therefore arranges to close the transmitter circuit before closing the circuit including the receiver and by using an impedance coil of lower resistance than the receiver circuit materially decreases the flow of current through the receiver.

TRANSMITTER DISINFECTER.

Orrin Henry Savage, New York, N. Y., patents (No. 840,662; dated January 8, 1907; filed June 17, 1905; serial No. 265,633) and assigns to Oakville Company, Waterbury, Conn., a telephone transmitter disinfecter.

This patent covers a form of disinfecter for attaching to the mouthpiece of a telephone transmitter. It is conical in shape, extending into the transmitter mouthpiece and so constructed as to permit of its retaining an absorbent material, saturated with some sterilizing solution, between the transmitter mouthpiece and its outer surface.

FIRE AND POLICE SIGNALING SYSTEM.

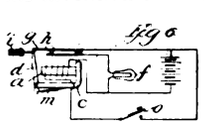
William Condon, Kansas City, Mo., patents (No. 848,636, dated April 2, 1907; filed July 7, 1902; serial No. 114,578) and assigns one-half to Albert Barrett, Kansas City, Mo., a fire and police signaling system.

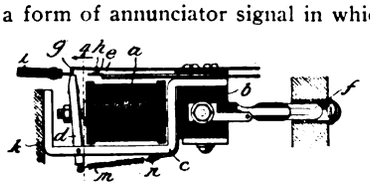
This patent covers a combined fire and police signal system in which either station may be called from the same box. It is also a combination of the indicating signal system commonly used and a telephone system. Registering devices are provided at both receiving systems, together with means by which one of the registering devices is actuated by either of the two receiving devices and the other registering device is actuated only when the receiving device which is responsive to only one of the two kinds of signals is actuated.

ANNUNCIATOR.

James L. McQuarrie, New York, N. Y., patents (No. 850,311, dated April 26, 1907; filed Oct. 2, 1905; serial No. 281,102) and assigns to Western Electric Co., Chicago, Ill., an annunciator.

This invention relates to a form of annunciator signal in which





the armature *d* is locked in position by the formed spring *g* upon the energization of the electro-magnet *a*, when thrown in circuit with the battery by the circuit-closing device *o*, and may not return to normal position until the retaining spring has been manually released.

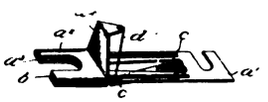
The armature is also held in the normal position by the spring *g*, so that it may not cause the circuit including the lamp signal to be closed except upon energization of the electro-magnet in the manner described.

The object of the invention is to provide an annunciator signal that will not be affected by the movement of the station at which it may be located, as, for instance, upon shipboard.

ALARM FUSE.

William E. Harkness, Chicago, Ill., patents (No. 850,365, dated April 16, 1907; filed Feb. 24, 1906; serial No. 302,667) and assigns to Western Electric Co., Chicago, Ill., an alarm fuse.

This patent covers a form of spring alarm fuse in which the surface terminal a^1 is provided with a spring *c*, which is an in-



tegral part of the terminal a^1. To the terminal a^2, which is insulated electrically from the terminal *a*, is electrically connected the spring *c* of the terminal *a* by the fuse wire *d*, which retains the spring *c* in a state of tension.

When a current of greater amount than is desired passes through the fuse it will open the circuit in the usual manner, releasing the spring *c*, which strikes a contact provided beneath the fuse, closing an auxiliary circuit in which is included an alarm signal.

RECEIVER ATTACHMENT.

Alcorn Rector, New York, N. Y., patents (No. 847,691, dated March 19, 1907; filed Nov. 24, 1906; serial No. 344,853) and assigns to himself, Daniel O. Sprague and Arthur P. Smith of New York, N. Y., a telephone attachment.

This device consists of an attachment for an ordinary telephone receiver, which may be placed between the receiver proper and the ear piece. The latter has two openings, one of the usual form of a telephone ear piece, and the other extending longitudinally from the side of the attachment, and is connected to a rubber tube leading into a second ear piece, attached to a spring, which is adapted to hold it close to the other ear of the person using the telephone. The inventor claims for this device that it obviates the possibility of foreign noises detracting a person's attention, as is customary where the receiver is used at one ear only.

TELEPHONE TRUNKING SYSTEM.

Francis W. Dunbar, Chicago, Ill., patents (No. 846,557; dated March 12, 1907; filed August 1, 1902; serial No. 117,923) and assigns to Kellogg Switchboard and Supply Company, Chicago, Ill., a telephone trunking system.

This patent covers an improvement over application of W. W. Dean, filed June 28, 1902, serial No. 113,581, of which the inventor says he contemplates accomplishing the same results by the use of an ordinary relay connected to one side of the trunk circuit at its incoming end and with ground as against a high resistance trunk relay, used by Mr. Dean, the function of which was to offer a path of such high resistance that sufficient current could not flow through it and over the metallic trunk line to operate a supervisory relay in the calling cord circuit to render the associated supervisory signal inoperative.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE.—We offer for sale the following assortment of Stromberg-Carlson Central Energy telephones displaced by our installation of Automatic equipment:

250 Type E central energy desk telephones with stationary head, corrugated nickel-plated pedestal, black enamel metal base, bipolar receiver, gold electrode transmitter.

1,000 No. 204 desk telephones with adjustable transmitter, knuckle joint arm, nickel-plated pedestal and base, same transmitter and receiver as above.

100 Type C. E., latest style desk telephone with No. 4 transmitter, all rubber bipolar receiver, black rubber pedestal, nickel-plated base, induction coils at end of cord instead of in base. A modern instrument.

1,000 Former type ZZ, later known as No. 37, business style central energy wall telephones complete with triplet set consisting of combined switch-hook, transmitter with adjustable arm, bipolar receiver, etc. This instrument is provided with shelf.

100 Former type Z, later known as No. 35, residence style, central energy wall telephone without shelf, otherwise same as No. 37.

These instruments are in good condition and will be sold at a reasonable figure. Prices will be furnished upon application to W. F. LAUBACH, Manager, Akron People's Telephone Co., Akron, Ohio. 822

SECOND HAND switchboards for sale—2 100 capacity Chicago Telephone Supply Co.; 1 200 capacity and 1 100 capacity Western Telephone Construction; 1 100 capacity Swedish-American; 2 50 capacity and 2 100 capacity Eureka; 1 100 capacity Standard; 3 100 capacity Keystone; 3 200 capacity and 1 100 capacity North. Address Victor Telephone Works, 6583 State St., Chicago, Ill. 817

FOR SALE--Continued

FOR SALE—For immediate delivery, one 100-line Kellogg switchboard, one 100-line Standard switchboard (self restoring drops), 60 Kellogg Selective telephones. Guaranteed first-class condition. Address United Telephone Co., Monroe, Wis. 826

FOR SALE—Telephone system in growing county seat; good construction, 175 telephones, no competition; healthy country, growing business. Address Box 827, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 827

WANTED

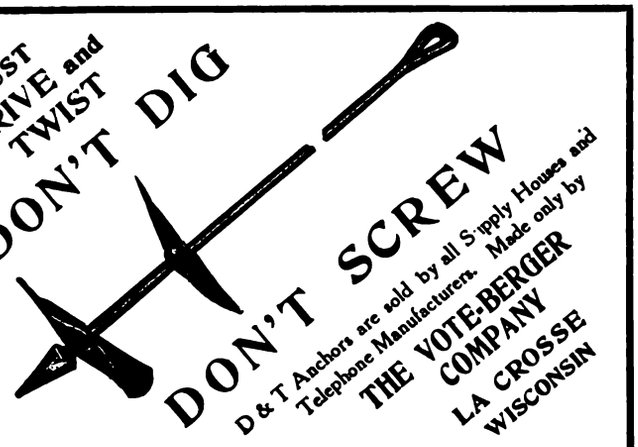
For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED.—The management of an electric light plant where the business can be built up. Have had experience and can "deliver the goods" on any electric lighting proposition. Open for engagement after July 1, 1907. Address Box 816, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 816

WANTED.—Competent man as superintendent, also first class switchboard repair man. Good salary for first class man. None other need apply. Address, Box 821, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 821.

WANTED—To get in communication with a telephone promoter who has made good in organizing telephone properties. We have a very attractive proposition for a capable man. Address, Box 824, care AMERICAN TELEPHONE JOURNAL. 100 William street, New York. 824

WANTED—Competent cable splicer. Position permanent. Send references. Address, Zenith Telephone Co., Duluth, Minn. 809



SUBSCRIBER'S LEASE AND TOLL LEDGERS

PATENTS—Continued

TELEPHONE TRUNKING SYSTEM.

William W. Dean, Chicago, Ill., patents (No. 843,871; dated Feb. 12, 1907; filed July 19, 1902; serial No. 116,148) and assigns to the Kellogg Switchboard and Supply Co., Chicago, Ill., a telephone trunking system.

This patent covers a form of telephone trunking between common battery exchange switchboards of the two-wire type. The trunks are operative in either direction in relation to signaling, that is the insertion of a plug in the jack at either end causes the actuation of a relay which in turn closes a circuit, causing a lamp to glow, which is cut out of circuit when the call is taken up at the opposite end. The regular supervisory lamps on the switchboard cord circuit described are adapted to perform their regular functions when in connection with the trunking system.

SPRING TERMINAL CLIP.

John Schade, Jr., Brooklyn, New York, patents (No. 845,268; dated Feb. 26, 1907; filed April 28, 1905; serial No. 257,948) and assigns to Fahnestock Electric Co., Brooklyn, N. Y., a spring terminal clip.

This patent covers a fastening device for electrical conductors in which the conductor is gripped securely by suitable spring arrangements obtained by making the device of resilient metal looped on itself. The inventor illustrates in his patent drawings ten different forms of the device, all covered by the same claims.

TELEPHONE SWITCH.

Fred Edwards, Jefferson, Iowa, patents (No. 841,491; dated Jan. 15, 1907; filed May 9, 1905; serial No. 259,645) a telephone.

This invention consists of a switch so arranged that a subscriber may, for any desired reason, open the battery circuit of his instrument, thus cutting out his transmitter and enabling him to listen to any conversation on the line without the interference of noises that would otherwise be taken up by his transmitter, and also economizing on the power secured from his local battery.

The switch is so arranged that the replacing of the receiver upon its hook causes the contacts in the switch to close automatically.

PARTY LINE LOCK-OUT SYSTEM.

Charles L. Carr and Thaddeus P. Carr, Yellow Springs, Ohio, patent (No. 847,316; dated March 19, 1907; filed October 10, 1904; serial No. 227,977) a party line lock-out system.

This patent describes a form of step-by-step selective lock-out system of the magneto type in which the switchboard operator actuates a device throwing pulsating current on the line to operate suitable relays in the telephones. These cause the rotation of discs, which interact with the fixed contact springs to complete the circuit of the instrument desired, but leave the other instruments on open circuit.

TELEPHONE DETECTOR.

Arnold R. Piehn, Alta Vista, Iowa, patents (No. 848,568, dated March 26, 1907; filed March 31, 1906; serial No. 309,136) a telephone detector.

This invention comprises a device installed in the telephone by means of which the central office operator is notified of the number of the subscriber in relation to his position on a party line, for the purpose of properly charging long distance tolls or other purposes. The intention is to have the device automatic in operation and so constructed that the subscriber can not hold conversation previous to the notification of the operator of the telephone number. To insure this feature a button is provided, the pressing of which operates the indicating device, and so arranged that the subscriber must press it in order to secure connection.

TELEPHONE HOOK SWITCH.

Ray H. Manson, Elyria, Ohio, patents (No. 850,870, dated April 16, 1907; filed May 9, 1904; serial No. 207,004) and assigns to Dean Electric Co., Elyria, Ohio, an electrical switch.

The inventor describes a receiver hook so mounted with its associated contact springs, on a specially formed standard that the hook may be readily removed from the switch as attached thereto without the use of tools and without disturbing the relations of the operative portions of the switch. The manner in which this is accomplished may be readily

Fig. 1.

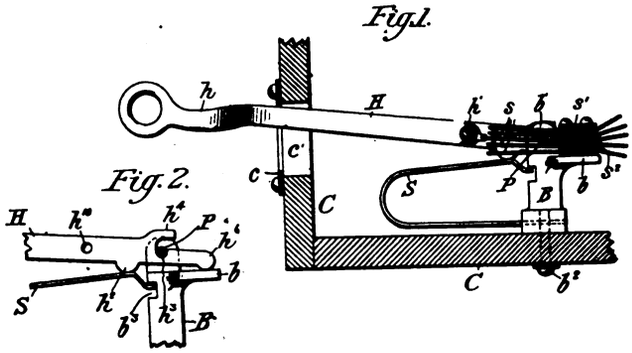

Fig. 2.

seen in Figure 2. By depressing the spring S and allowing the hook H to drop so that the pivot P will take position in the upper portion of the slot h^3 the hook may be freely removed by a slight pull. It may also be noted that the downward movement of the hook is controlled by the spring S in the notch b^5 while the upward movement is governed by the striking of the hook extension h^6 on the lateral projection b of the standard B. The insulated stud h^1 is provided to engage with one of the springs of the switch so that raising or lowering the hook will operate the switch which is mounted in its entirety on the lateral projection b.

ACOUSTICON ATTACHMENT.

Kelly M. Turner, New York, N. Y., patents (No. 839,050; dated Dec. 18, 1906; filed April 9, 1906; serial No. 310,617) an attachment for acousticons permitting use of ordinary telephones.

This device consists of a cylindrical attachment by means of which, the acousticon transmitter as worn by deaf persons, may be clamped to the face of an ordinary telephone receiver, the deaf person thus receiving the conversation through the acousticon receiver, to the use of which he is more accustomed.

MODULATING TELEPHONE RECEIVER.

Kelley M. Turner, New York, N. Y., patents (No. 848,073, dated March 26, 1907; filed Jan. 13, 1906; serial No. 295,834) a modulating telephone receiver.

This invention describes a device comprising a cap for a telephone receiver within which is mounted what the inventor terms a dampening pad so arranged that by slightly moving a lever varying degrees of pressure may be exerted on the diaphragm of the receiver, thus modifying the intensity of the tone of the instrument. The application specified by the inventor is that the volume of sound may be modulated so as to give the best results to a deaf person in using receivers of the acousticon type which primarily have a large volume.

The Iron Wire Ballast

To Regulate

AMOUNT OF CURRENT RECEIVED IN SUBSCRIBERS' TRANSMITTERS.

¶ Subscribers' transmitters located close to exchange receive their full voltage and therefore talk adequately Transmitters located at a distance from exchange receive greatly diminished current on account of line resistance, and talk a great deal less strongly and clearly than when located near the exchange.

¶ By inserting the *V-B Iron Wire Ballast* in the transmitter feed in the exchange and increasing the central battery voltage, practically the same transmission qualities can be given to telephones located at a distance from the exchange that are given to transmitters near the exchange.

¶ The Ballast will be of low resistance when placed in series with the lines whose resistance would protect the transmitter, therefore high voltage in the exchange will give these transmitters their full supply of current, and *their fullest efficiency.*

¶ If the ballast is placed in series with the transmitters in the exchange, the resistance of the ballast will increase instantaneously, and protect the transmitter from getting an over supply of current. In other words, *the transmitters will always receive their full supply of current and none of them can receive enough current to injure them.*

¶ THE VOTE-BERGER COMPANY, La Crosse, Wisconsin, sole owners of the V-B Iron Wire Ballast Patents, are now prepared to make immediate deliveries on ballasts equipped either with Edison bases, or flat terminals for transmitter circuits or operator's ringing leads.

¶ A line from you, addressed to Department C, THE VOTE-BERGER COMPANY, La Crosse, Wisconsin, will bring you complete and interesting information regarding the various applications of the iron wire ballast.

¶ If you contemplate purchasing a common battery switchboard, do not delay sending in your plans or specifications. Sales engineers of THE VOTE-BERGER COMPANY will call upon you if you so desire.

IN THE MANUFACTURING FIELD

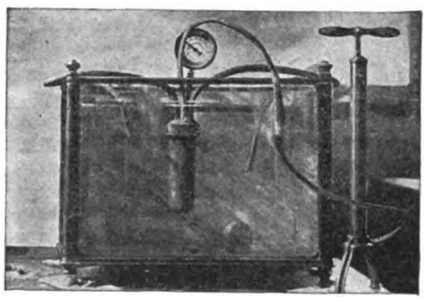
"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

TESTING A CABLE JOINT.

THE manufacturers of the Hargis cable splicing joint have been asked by one or two telephone companies whether it was absolutely moisture proof. To satisfy themselves that it was impervious to moisture, they made the following test:

An ordinary goldfish tank was procured and filled with clear water. A No. 2 Hargis cable splicing joint was connected up to three cables, making a regular three-way branch joint. A pressure gauge was attached and also a pipe to which a foot pump was connected, as shown in the illustration made from a photograph taken during the test.

By operating the foot pump considerable air pressure was obtained on the inside of the joint. If there was any place for moisture to enter the air under pressure would surely escape and show itself by the bubbles that would appear coming up through the water. This simple and convincing test is recommended to those who have any little doubts about the moisture resisting qualities of Hargis cable splicing joints. For further information in regard to these joints write to W. N. Matthews & Bro., 242 North Second Street, St. Louis, Mo.



Apparatus Used for Testing Hargis Cable Joint, Ready for Service.

DEAN ELECTRIC CO., Elyria, O., has recently received many important switchboard orders, among which are the following: From Sheboygan, Wis., a common battery multiple, 3,000 ultimate capacity switchboard, equipped with 1,260 lines and 20 rural lines; a chief operator's desk, wire chief's desk, intermediate frame, relay rack, complete power plant and Dean harmonic converter for ringing. The installation includes individual ringing keys on each position of the board. The Sheboygan board has the Dean line and cord test on each position.

Fulton, N. Y., has ordered a Dean common battery multiple 2,000 ultimate capacity switchboard with 560 lines equipped, a chief operator's desk, main frame and relay rack, and complete power plant, including the Dean harmonic four-party ringing outfit. This board also has cord and line test on each position.

Berea and Carey, Ohio, and Point Pleasant, W. Va., each have ordered magneto switchboards arranged for 450 lines, 300 lines and 400 lines, respectively. These shipments also include Dean full harmonic converter equipment for ringing.

A contract has been let to the Dean Company for a new switchboard for Colusa, Cal. This board will be a 1,500-line ultimate capacity standard common battery multiple switchboard equipped with 300 lines. A combined toll and chief operator's desk, wire chief's desk, main and intermediate frames, relay rack, complete power plant and standard harmonic ringing equipment go with this order.

COMMERCIAL ELECTRICAL SUPPLY CO., St. Louis, Mo., calls the attention of its customers to the importance of buying electric fans before the price has advanced with the coming of warm weather.

The company also has in stock at St. Louis a very full line of rubber-covered and lead-covered wires and cables. Price and other information will be forwarded promptly to all inquirers.

THE PREMIER ELECTRIC CO., formerly at 118-132 West Jackson Boulevard, Chicago, Ill., removed on May 1st to 141 South Clinton street, Chicago.

This company is well known as a manufacturer of electrical braided goods and cords and wires for telephone purposes, Premier "B.B." switchboard cords, telephone receiver desk set and transmitter cords, switchboard receiver cords, braided cotton sleeve and jumper wire.

In its new location it will have much improved facilities for handling its rapidly increasing business. The company is able to give prompt attention to orders from any part of the country. It will be pleased to explain the characteristics of its various products to telephone men who are able to visit its new offices or by mail on receipt of a request.

S. H. COUCH CO., 156 Purchase street, Boston, Mass., manufactures complete apparatus for intercommunicating systems. The company's bulletin No. 9 gives detailed descriptions of the apparatus and wiring used in the systems which it recommends. It has an intercommunicating system for offices, factories, hospitals, residences, etc. The type of apparatus used is such that trunk connection with the central office may be obtained if desired. For instruments, various types of wall sets, including those which may be set flush with the surface, may be used, and the switch is also mounted in the base of a desk stand.

MANHATTAN ELECTRICAL SUPPLY CO., 17 Park Place, New York, is issuing a new catalogue showing a very complete line of telephone and telegraph apparatus. Illustrations and prices of all apparatus are given. This company supplies complete telephones and all classes of minor supplies, such as batteries, cords, tape, insulators, construction material, tools, etc., which are required in telephone work. Any desired information will be sent upon receipt of a request.

JULIUS ANDRAE & SONS' COMPANY, 99 West Water street, Milwaukee, Wis., has recently received an order for a supply of its patented form of condenser from Honolulu, Hawaiian Islands. This shows the widespread reputation that this little "party line purifier" has attained. A great many companies are using these condensers, which may be very quickly put in service without cutting into the inner circuits of the instruments.

INDIANA STEEL & WIRE CO., Muncie, Ind., is ready for the man from Missouri, as it not only claims that its wire is manufactured in such a way as to give it the highest strength and conductivity together with permanent galvanization, but it has had these properties tested in the laboratories of several of the leading universities of the Middle West. The results of these tests are published in a very neat booklet which the company is sending out to the trade. Persons interested in the qualities of high-grade iron wire should not delay in sending for this booklet before the supply is exhausted.

STROMBERG-CARLSON TELEPHONE MANUFACTURING COMPANY, Rochester, N. Y., reports the receipt of signed contracts up to March 30, 1907, as follows: Four sections 980 additional line equipments, Des Moines, Ia.; 1 section 240 lines central energy visual signal series multiple switchboard, Brookville, Pa.; 1 section 2-position toll board equipment, Mt. Pleasant, Ia.; 4 sections 700 additional line equipment, main exchange, Seattle, Wash.; 2 sections, 300 additional line equipments, Queen Anne Exchange, Seattle, Wash. Central energy P.

TROUBLE!!

When you have found that the trouble in your telephone cable is in a certain joint, it is not necessary to blow the joint or cut the sleeve when you use HARGIS CABLE SPLICING JOINTS. Just take your pair of spanners, unscrew the pot from the ring, unlace the pairs and spread them out like a fan. You can then test the pairs with greater ease than you can with a horizontal wiped joint, on account of the ease in getting at the inside pairs. You don't have to go all over the work again of soldering a seam in your sleeve and wiping the ends of a joint when the repair is made; just screw the pot on the ring and tighten with spanners and you have a perfect joint.

Absolutely moisture proof. Made in three sizes. Costs less on first installation. Saves money while in use. Send in your order to-day.

IN THE MANUFACTURING FIELD

B. X. switchboards have been ordered in Louisville, Ky.; Franklin, Pa.; Leavenworth, Kans.; Port Washington, Wis.; Fairport, N. Y.; Fort Wayne, Ind.; Hammond, Ill.; Magnolia, Ill.; Seattle, Wash.; Buffalo, N. Y.; Brackenridge, Pa.; Harrisburg, Pa.; Rochester, N. Y.; Minier, Ill.; Eden, Ill.; Goldonda, Ill.; Arcanum, Ohio, Joy, Ill.; Garfield, Ky. Other orders are from Kershaw, S. C.; Jones, Mich.; Cleopatra, Mo.; Keokee, Va.; Venus, Pa.; Mt. Etna, Ia.; Dresden, Tenn.; 3 generator call switchboards, Seattle, Wash.; 4 generator call switchboards, Sunnyside, Wash.; Pomona, Ill.; Peck, Idaho; Cul de Sac, Idaho; Des Moines, Ia.; Madison, Wis.

W. G. NAGEL ELECTRIC CO., Toledo, O., in the April number of *Electrical Times*, has a number of items especially interesting and useful to Independent telephone men. One of these for example, is a table of equivalents of wires, B. & S. gauge, showing how many wires of different small sizes have the same carrying capacity as a single wire of a larger size. This would be useful as a reference to those who have to do with telephone power plants. Another table giving very complete information about commercial copper wires, 98 per cent conductivity, is also printed in this issue. As usual the Nagel current price summary appears in this number, which will be sent free of charge to any telephone man who asks for it.

THE STRENGTH OF BIRCH INSULATOR PINS.

IN many parts of the country telephone men have been looking for a wood which could be satisfactorily substituted for locust, which is probably most commonly used for insulator pins.

The Maine Hub and Manufacturing Company, West Seboois, Me., believes that it has in its birch pins a substitute which will make a strong appeal to many construction men. It has had its product tested in the well-equipped laboratory of the Armour Institute of Technology, with the results indicated in the following report:

ARMOUR INSTITUTE OF TECHNOLOGY, CHICAGO.
F. W. GUNSAULUS, President.

OCTOBER 7, 1905.

Maine Hub and Manufacturing Co.,
West Seboois, Me.

Gentlemen: The following results were obtained in tests of birch insulator pins. The sketch shows the manner of applying load, and of holding specimen.

Dimensions (referring to sketch).

	Nos. 1 and 2. Inches.	Nos. 3 and 4. Inches.	Nos. 5 to 10 Inches.
L	4 7/8	3 7/8	4 7/8
d	1 1/4	1 1/4	1 1/2
D	1 5/8	1 5/8	1 3/4
S	4	4	4
l	4.40	3.57	4.40

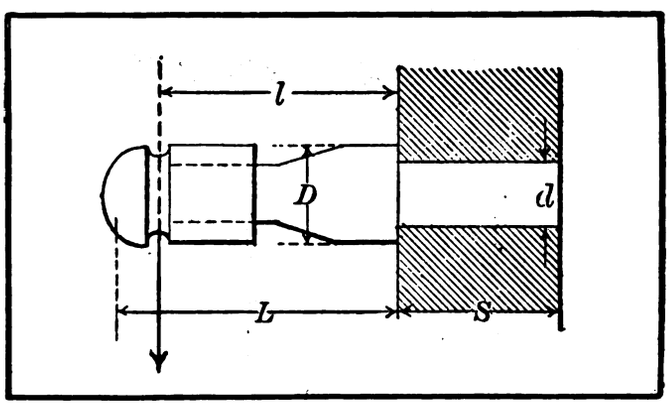
No. of Specimen.	Direction of Force.	Maximum load in Pounds.
1	1 with grain	890
2	2 across grain	900
3	2	925
4	1	1050
5	1	870
6	2	1320
7	1	1100
8	2	1310
9	1	815
10	2	1350

The broken specimens, marked as above, have been returned to you by express.

Yours very truly,
(Signed) R. BURNHAM,
Professor of Experimental Engineering.

The company is prepared to send out further and more complete information, and give some interesting prices to those who wish to follow up the subject.

BAY STATE INSULATED WIRE AND CABLE CO., Hyde Park, Mass., announces the completion of its extensive new wire mills, and states that it is now ready to manufacture insulated wires and cables of every description. The capacity of the mills is at present 500,000 feet per day; with additional machinery under construction that will enable the company to turn out twice as much work. The president, Mr. Andrew J. Conlin, was for the past eighteen years superintendent of the plant of the Simplex Electrical Co., at Cambridge, Mass., and, having held other positions of importance in the manufacture of insulated wire, is looked upon as an authority in this particular line. The treasurer



Explanatory Diagram Accompanying Prof. Burnham's Report on Test of Birch Insulator Pins.

and manager, Mr. John H. H. McNamee, formerly Mayor of Cambridge, Mass., will look after the company's financial and business interests. Mr. Alfred W. Worthley is in charge of the sales department, which he will be well able to handle, having been associated formerly with the Eastern Electric Cable Co. The company intends to furnish its customers only the best of material, prompt deliveries and reasonable prices. It will be pleased to answer all inquiries.

GENERAL STORAGE BATTERY COMPANY, 42 Broadway, New York, has just issued a bulletin on the installation and operation of transportable batteries, which covers this ground in an especially clear and thorough manner. The directions show just what to do from the time the batteries are received, packed in boxes, through the various operations of unpacking, connecting, adding the electrolyte, first charge and subsequent use of the batteries. This information should be very useful to every telephone man located in a central energy exchange. Any manager who desires a copy of these instructions should write at once to the Operating Department of the company.

BAIRD MFG. CO., 1522 Briar Place, Chicago, Ill., is sending out a folder bearing a legend which ought to appeal to every telephone man, namely: "Your troubles end here." Of course, the thing that brings this about is the new Baird Cash-Register Pay-Station which is explained in the balance of the folder. Interested persons can find out just how this will end their troubles by writing to the company.

BLAKE SIGNAL AND MANUFACTURING CO., 246 Summer street, Boston, Mass., has established the following agencies for the Blake tube flux: George F. Schoen, 108 South Forsyth street, Atlanta, Ga.; Syles R. Fralick, 269 South Canal street, Chicago; Wesco Supply Company, St. Louis, Mo.; Brooks-Follis Electric Corporation, 212 First street, San Francisco, Cal.; the Erner and Hopkins Co., Columbus, O., and Norton System Telephone Company, Toronto, Can.

246 SUMMER STREET BOSTON, MASS.

Talks With The Buyer—No. 7

Publishers of trade papers have a grudge against me. One of them said the other day: "Why in the world don't you take more space, when other houses much smaller are advertising more? A house that ranks as you do in volume of business should have one page at least." Perhaps he is right, but I believe that if you are interested you will read my "talks," whether they are spread over two pages or boiled down to a half page. What you want is the kernel in the nut.

ANOTHER WORD ABOUT TELEPHONES

If we don't get into our new factory pretty soon I will have to cut these ads. out altogether, because our present factory is having to run day and night to fill our orders and keep up our reputation for prompt shipments. I got a letter a couple of days ago from a man, who said: "I would like to try your 'phones, but my electrician seems wedded to the ——phone. You may ship two samples." The very day another man called who was using the same make and gave me a contract for his year's requirements because the transmitters on the other make were falling down on him, yet extensively advertised as the standard from which all others are judged. Why are so many of you partisan toward one or another make of instruments? Because a certain make was a good instrument five years ago, is there one single reason why it should be the best instrument to-day? We may have eclipsed with our recent improvements the best efforts of that company whose equipment was standard last year or the year before. So do not judge our apparatus until you have tried our samples, instruments which are not special in any sense, but are from finish of woodwork to magnet steel our average standard product.

We do not give away samples; we do not offer to sell a sample pair of instruments for half the regular value as an inducement. I do not want you to buy our 'phones if we have to offer you an inducement save in honest values. You are standing in your own light to-day, now, and every minute, until you write me ordering sample 'phones sent you absolutely at our own risk and without obligation on your part to keep them unless absolutely satisfactory to you in every way.

NEW COMPANIES.

MAGNOLIA, ARK.—A new telephone company, to be known as the Magnolia Telephone Company, has been organized with R. L. Morris as president and Gus Kohn as secretary and treasurer.

FISHER, ILL.—The Farmers' Telephone Company is being organized at Fisher.

DALE, IND.—Articles of incorporation have been filed by the Farmers' Mutual Telephone Company, of Dale. It has an authorized capital stock of $10,000, and the incorporators are C. W. Randolph, John Wibbeler, John Meier, Wesley Painter and John Ellis.

FOREST, IND.—The Forest Telephone Company, with a capital stock of $4,950, has been incorporated.

MOUNT VERNON, IND.—The St. Philip Telephone Company, St. Philip (P. O. address Mount Vernon), has been incorporated, with a capital stock of $2,000, and the following directors elected: Fred Kirchoff, Frank Neff, G. J. Ehrhardh, I. E. Hartig and J. A. Deig.

RUSSIAVILLE, IND.—The Russiaville Co-operative Telephone Company has been incorporated with a capital stock of $5,000. The directors of the company are Albert Lindley, O. L. Evans, J. E. Waters and others, and it is its intention to build and equip an exchange at this city and to extend its lines throughout Howard, Clinton and Tipton counties.

CURLEW, IA.—Articles of incorporation have been filed by the Laurens-Curlew Telephone Company, whose principal place of business will be at Curlew. It has an authorized capital stock of $5,000, and the following officers have been named: President, H. P. Johnson; vice-president, J. W. Johnson; secretary and treasurer, H. H. Sample.

DALLAS, IA.—The Dallas Mutual Telephone Company has filed articles of incorporation. The corporation is to last for twenty-five years, and its intention is to build and maintain a line west of Dallas. The capital stock is placed at $1,000, and the incorporators are J. A. Miller, A. H. Hartz, H. W. Willis, J. H. Friday and W. M. Hoffman.

WESLEY, IA.—A Independent telephone company, to be known as the Wesley Rural Telephone Company, has been incorporated at this city. The capital stock has been placed at $2,000, and O. K. Floran and others are among the stockholders.

MADISON LAKE, MINN.—A number of farmers between Madison Lake and Janesville have organized a Farmers' Telephone Company, whose intention it is to construct a line from Madison Lake to Janesville, at which place it will connect with the Cannon Valley system. It will also give service to St. Clair and Cream.

BUTLER, MO.—The Mount Pleasant Mutual Telephone Company, Butler, has been incorporated, with a capital stock of $2,400. Among the incorporators are T. N. Ervin, E. D. Wilcox, Fred Church, M. C. Wilcox and others.

MONIDA, MONT.—Articles of incorporation have been filed by the Centennial Telephone Company. It has a capital stock of $20,000, divided into 2,000 shares of the par value of $10 per share. R. T. Boatman, of the Centennial Valley, is president; A. B. Wakefield, vice-president; P. I. Smith, of Dillon, secretary and treasurer. It is the intention of the newly organized company to construct and maintain a telephone line between Monida and Lakeview, through the Centennial Valley.

RAMSEUR, N. C.—The People's Telephone Company, of Ramseur, has been incorporated with an authorized capital stock of $20,000, and the incorporators are E. Watkins, J. W. Parks, N. F. Marsh, H. B. Moore, J. I. Lambert, W. D. Lane and M. E. Johnson.

HOWELL, O.—The Rankin Creek Telephone Company, of Howell, with a capital stock of $1,000, has filed articles of incorporation. Among the incorporators are Newton Kite, J. H. Thomas, Martin Langdon, Vance Kite and Grover Carrico.

OKLAHOMA, OKLA.—An Independent telephone company, to be known as the Twin Creek Telephone Company, has been incorporated with a capital stock of $5,000. The incorporators are J. P. Petrasek, W. P. Reding and N. Y. Reding.

VICI, OKLA.—The Vici Rural Telephone Company has been incorporated, with a capital stock of $5,200, and the following directors elected: O. W. Hauser, D. J. Schramburg, E. A. Speck, of Vici.

ULYSSES, PA.—An Independent telephone company, to be known as the Ulysses-Loucks Mills Telephone Company, has been organized to build a line between Ulysses and Loucks Mills. It is also the company's intention to later extend its lines to Galeton.

WEST ALEXANDER, PA.—The Farmers' Mutual Telephone Company has been organized, and it is its intention to connect with a number of farmers' lines in Benham and Dallas.

ORANGEBURG, S. C.—A new telephone company has been organized at this city for the purpose of building lines to Bowman. It has a capital stock of $2,000, and is to be known as the Orangeburg-Bowman Telephone Company. Construction work will be commenced at an early date.

PLEASANT VALLEY, TENN.—The Pleasant Valley Telephone Co. has been incorporated with a capital stock of $5,000.

CHILLICOTHE, TEXAS.—The Independent Telephone Company, of Chillicothe, with a capital stock of $2,500, has been incorporated by F. L. Moffett, W. O. Herring, J. C. Lane, W. H. Pepper and G. R. Jones.

WELLINGTON, TEX.—Articles of incorporation have been filed by the Union Telephone Company, of Wellington. It has an authorized capital stock of $2,000, and the incorporators are J. T. Littlefield, A. Burger, H. A. Jones, V. Allen and P. W. Myers.

PASSUMPSIC, VT.—The Passumpsic Telephone Company, whose intention it is to operate in Essex, Orleans and Caledonia counties, has been incorporated with a capital stock of $250,000.

COLBY, WIS.—The Colby & Southwestern Telephone Company has filed articles of incorporation. It has an authorized capital stock of $600, and the incorporators are Louis F. Frome, Henry A. Frome and A. K. Andrews.

FOND DU LAC, WIS.—The Woodhull Telephone Company, Lamartine (P. O. address Fond du Lac), has been incorporated, with a capital stock of $2,500. Among the incorporators are J. A. Stratz, Frank Schaefer and O. S. Fenner.

JEFFERSON, WIS.—The Jefferson Mutual Telephone Company, Jefferson, has been incorporated with a capital stock of $10,000. Among the incorporators are R. B. Hellen, J. M. Bienfang and O. F. Roessler.

FRANCHISES.

TALIHINA, I. T.—M. C. Morris and others have applied to the city council for permission to install a telephone exchange and system in this city.

ELLSWORTH, KAN.—A twenty-year franchise has been granted to the Ellsworth Co-operative Telephone Co. to install and maintain a telephone system in the city of Ellsworth.

LANSING, MICH.—The common council has granted the Citizens' Telephone Company an amended charter, and the installation of its new system will be completed within a year. The company is also to erect a new building.

ST. HILAIRE, MINN.—A franchise has been awarded by the city council to G. W. Hooper, of Crookston, for a local telephone system, and work will be commenced on the plant at once.

EUREKA, S. D.—A telephone franchise has been granted to the Farmers' Mutual Telephone Company to erect and maintain telephone lines in this city.

FINANCIAL.

CARMI, ILL.—The capital stock of the White County Telephone Company has been increased to $25,000, and the increase in capital is to be used to improve the company's plant.

MINIER, ILL.—The Mutual Telephone Company has increased its capital stock to $38,000.

POLO, ILL.—The Polo Mutual Telephone Company has increased its capital stock from $5,000 to $10,000.

ANNANDALE, MINN.—At the annual meeting of the Annandale Telephone Company a seven per cent dividend was declared, payable June 10.

BERLIN, O.—The Berlin Telephone Company has increased its capital stock from $4,050 to $25,000.

CLEVELAND, O.—The Citizens' Telephone and Message Company has increased its capital stock from $50,000 to $100,000.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

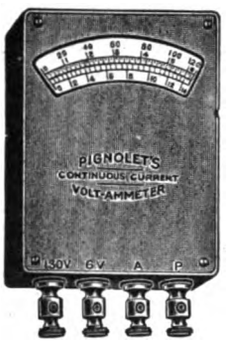
TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

MICHIGAN WHITE CEDAR POLES

We have a large stock of White Cedar Poles of all sizes, concentrated at a point on the D. & M. R. R. in lower Michigan, from which we can make prompt deliveries. The location of this stock offers exceptional facilities for shipments to all points in Ohio, Indiana, Southern Michigan and the Eastern States. Write us for delivered prices on any size for immediate shipment.

THE WEEK'S MESSAGES

MEDINA, O.—The capital stock of the Medina Telephone Company has been increased from $30,000 to $44,500.

SARDINIA, O.—The People's Telephone Company, of which J. N. Plummer is president and F. L. Weisbrodt secretary, has increased its capital stock from $5,000 to $15,000.

THURSTON, O.—The capital stock of the Buckeye Lake Home Telephone Company has been increased from $10,000 to $30,000. The increase in capital will be used in new construction work. The company expects to extend its service through the northern townships of the county, and lines will be extended also as far north as Kirkersville.

BARTLETT, TEXAS.—At its annual stockholders' meeting the Bartlett-Walburg Telephone Company declared a dividend of ten per cent for the past year.

ATHENS, WIS.—The capital stock of the Athens Telephone Company has been increased from $750 to $6,000.

GRANTSBURG, WIS.—At the annual meeting of the St. Croix Mutual Telephone Company, held at this city, the capital stock was increased to $6,000.

COMBINATIONS.

ONEIDA, ILL.—The four county telephone companies have consolidated and formed one company, and the following directors have been named: A. F. Hannam, A. J. Miller, A. D. Metcalf, G. L. Stephenson and J. F. Epperson.

GRANTSBURG, WIS.—The Farmers' Independent Telephone Company has made a five-year contract with the Tri-State Telephone Company for exchange service.

ELECTIONS.

LAWN RIDGE, ILL.—The following officers have been elected by the Lawn Ridge Telephone Company: Chas. Timmons, president; F. H. Cornell, secretary and treasurer; P. E. Phillips, manager.

ITHACA, N. Y.—At a meeting of the recently incorporated Cayuga Southern Telephone Company the following officers were elected: President, Samuel Jeffrey; vice-president, Isaac P. Hazard; secretary, R. B. Fegan; treasurer, G. W. Jeffrey. The following were chosen on the executive committee: Samuel Jeffrey, R. B. Fegan and Isaac P. Hazard, Jr.

NORTH HANNIBAL, N. Y.—The North Hannibal Telephone Company has elected the following officers: President, Ralph Stark; secretary, C. S. Lockwood; treasurer, E. A. Pearce. Directors: A. B. Keeney, F. E. Babcock, Frank Lathrop and Jos. Albring.

BARTLETT, TEXAS.—The following officers have been named by the Bartlett-Walburg Telephone Company: W. T. Cox, president; J. E. Comdra, vice-president; D. R. Irvin, secretary, treasurer and general manager.

THURSTON, O.—The following directors have been elected by the Buckeye Lake Home Telephone Company: Daniel Mauger, Daniel Wagner, William Reinshield, John Palmer, W. T. Kemp, Clarence Lamb and George Haver.

MISCELLANEOUS.

POLO, ILL.—At a meeting of the representatives of the Independent Telephone Companies of District No. 2, of Northern Illinois, held at Polo, April 25, 1907, the following delegates were chosen to attend the state convention, to be held at Springfield, May 14 and 15: Chas. Segerlund, L. A. Herrick, G. E. Shoemaker, A. C. Biesemeir, F. M. Yokum, H. Wales, S. Kenedy, W. P. Landon, G. W. Pitcher, W. H. Glascow, L. S. Bowen, F. Zinnell, Geo. Mallendy, L. A. Pitcher, E. N. Howell, T. C. Ainsworth, A. G. Hawlew, R. H. Gibboney, B. F. Swab.

WILLIAMSTOWN, KY.—The Williamstown and Owenton Telephone Company has been acquired by the Citizens' Telephone Company, of Cincinnati. It is expected that the new owners will greatly enlarge the system, which already reaches three county seats with its main line, and into almost every village in Grant, Owen and Pendleton counties. The consideration is said to have been $15,000.

PERSONAL.

FREDERICK W. CHAPMAN has recently been appointed manager of the exchange of the New England Telephone and Telegraph Company at Milford, Mass.

J. ARTHUR CONE has been appointed manager of the exchange of the Wisconsin Telephone Company at Appleton, Wis.

S. C. CRANDALL has been elected secretary and treasurer of the Westfield Telephone Company, Westfield, N. Y., and will also have active management of the system.

JOHN KEARNS has been appointed superintendent of the newly organized division of the Pacific States Telephone and Telegraph Company, which has its headquarters at Oakland, Cal.

A. J. MILLER has been appointed manager of the Zinnel Telephone Company's exchange at Milledgeville, Ill.

J. D. NELSON has been appointed manager of the exchange of the Southwestern Telephone and Telegraph Company at Belton, Texas.

L. J. VAN ALLEN has been appointed manager of the Central Union Telephone Company's exchange at Warren, Ohio.

GEORGE S. REINOEHL has been advanced from the management of the Reading exchange of the Pennsylvania Telephone Company to the position of chief clerk to the general manager at Harrisburg, Pa.

New Construction in the Field

BRYANT, ILL.—The lines of the Bryant and Dunfermline Telephone Company are being improved and extended.

HEBRON, ILL.—The Farmers' New Era Telephone Company, of this city, has planned many improvements in its system. An exchange has been purchased at Genoa Junction, Wis., and lines are to be built in Racine, Kenosha and Walworth county. An exchange is also to be established at Wilmot, and from this point lines are to be extended to Silver Lake, Camp Lake, Trevor, Salem, Wheatland, Bassett's Station, Corliss and Burlington.

LEXINGTON, ILL.—The Independent Telephone Company is making plans for the erection of a two-story fireproof building near its present location, which it expects to occupy about the first of August. Manager L. F. Hyneman will have charge of the improvements in the plant, which include the installation of a considerable amount of underground cable in the downtown district, as well as the rebuilding of the exchange.

RUSHVILLE, IND.—A new exchange building is to be erected by the Co-operative Telephone Company.

ARDMORE, I. T.—The Merchants & Planters' Telephone Company is building a line from Orr to Marietta. The new line will pass through Petersburg, Rubottom, Courtney, Leon, Jimtown, Burneyville and Pike.

NOBLE, IA.—The lines of the Wayland Telephone Company are being overhauled.

TREYNOR, IA.—Lines from Treynor, covering the territory north, west and south from the town are to be constructed by W. J. Way, who also expects to establish an exchange at this city. It is his intention also to take over part of the Mineola line.

CHARLOTTE, MICH.—It is the intention of the Eaton County Telephone Company to make many improvements in its system.

GAYLORD, MICH.—Among the extensions planned by the Otsego County Telephone Company is a line from Gaylord to Frederic.

SARANAC, MICH.—The construction of new lines is being considered by the Citizens' Telephone Company.

VERMONTVILLE, MICH.—The lines of the Citizens' Mutual Telephone Company are to be extended in and about Vermontville.

WATKINS, MINN.—Many improvements are contemplated by the Watkins Telephone Company in its plant.

CREIGHTON, NEB.—The Camp Dewey Telephone Company, which operates lines in all parts of Knox and Boyd counties, contemplates the erection of a new exchange in this city.

ELKO, NEV.—The Elko County Telephone & Telegraph Company is planning many improvements, among which may be mentioned the institution of a new and up-to-date magneto metallic circuit system on all its lines, the building of new lines from Beowawe to Tenabo, which will connect with Elko, and the installation of an exchange at Wells.

GASTONIA, N. C.—The Piedmont Telephone & Telegraph Company is considering the advisability of making many improvements in its system.

RALEIGH, N. C.—The Raleigh Telephone Company is building a line from this city to Lake Forest.

ELIDA, O.—It is the intention of the Elida Mutual Telephone Company to install a new switchboard and otherwise improve its system.

BEAUMONT, TEX.—To accommodate its greatly increased business, the Beaumont Telephone Company intends to enlarge its plant at this city.

BURNSVILLE, W. VA.—A line from Claysville to Burnsville is being constructed by the Burnsville & Claysville Telephone Company.

BARRON, WIS.—It is the intention of the Barron County Telephone Company to extend its system from Rice Lake to Barron. A new circuit between the county seat and the metropolis of Barron county is also to be erected.

WALWORTH, WIS.—The lines of the Walworth Telephone Company are being extended in this city.

WAUSAU, WIS.—The Wausau Telephone Company contemplates many improvements and extensions in its system.

LINDSAY, ONT., CAN.—The Canadian Machine Telephone Company is making preparations to begin construction work in Lindsay.

SOAKED IN WATER NINE DAYS

WORKS AS WELL AS EVER

This is the unsolicited statement of Mr. Price, Manager of the SHARP COUNTY TELEPHONE CO. of EVENING SHADE, ARK.

This is what he says:

EVENING SHADE, ARK., March 23, 1907.

WESCO SUPPLY CO., St. Louis, Mo.

Dear Sirs:

I received a card not long since from the ——— Telephone Co. stating an accident occurring to one of their telephones. Now, I had an accident near Evening Shade in which I lost one of the Wesco Bridging Telephones in the river. The telephone was under water 9 days when it was recovered and dried out. The varnish is still good except the box looks white. All the workings are all right except the induction coil, which had to be replaced. Outside of the looks and a little mud to be cleaned from the workings, the Telephone is O. K.

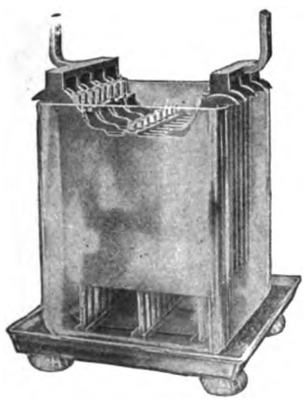
I am carrying it around as a show and test instrument.

Yours very truly,
C. C. PRICE, Manager.

Send for our New Bulletin No. 75 and get our prices on WESCO HONOR-MADE TELEPHONES.

THE WESCO SUPPLY CO.

FT. WORTH, TEX. ST. LOUIS, MO.



CLAIMS FULFILLED

Viewed from the standpoint of scientific theory, no other storage battery plate can compare, detail for detail, with the Gould Integral Plate. Many of the largest Telephone Companies in the United States have purchased Gould Storage Batteries on the *very apparent* merit of our battery. It is a most significant fact that in almost every such case *repeat orders* have followed the first test order. The Gould Battery has succeeded because it has made good our claims for its unusual merit and economy.

Write for our catalogues.

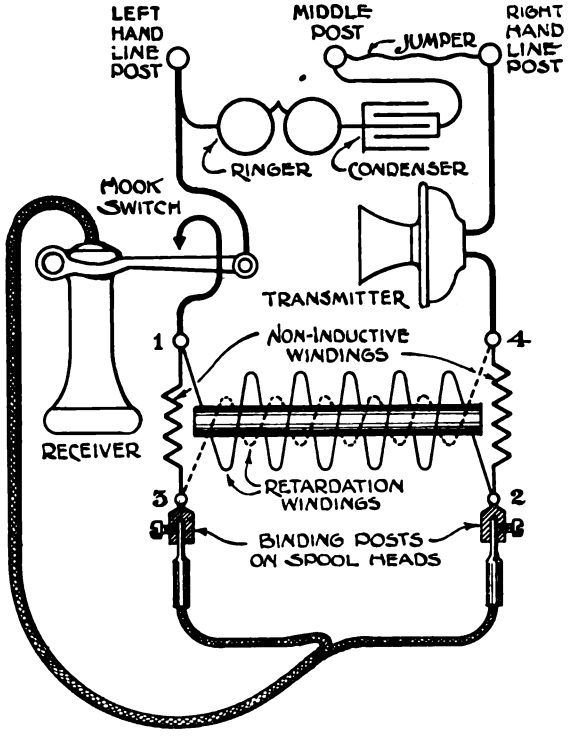
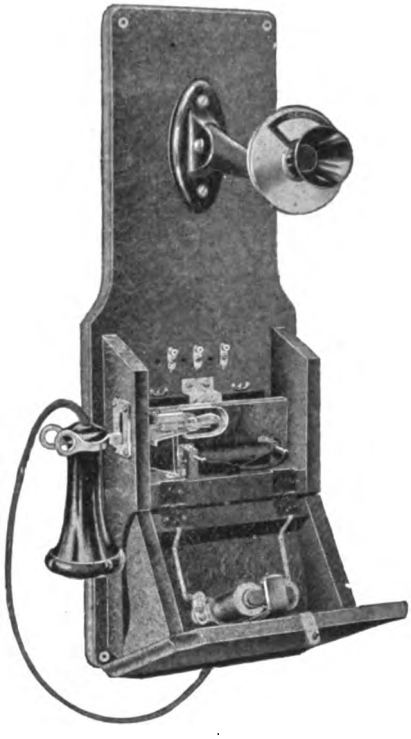
DEAN TELEPHONE APPARATUS

THE CIRCUIT.

The wiring of our common battery telephone with the balanced wheatstone's bridge coil as employed in actual practice shows at a glance to the experienced telephone engineer why the Dean instrument excels all others. This Circuit arrangement keeps the direct current flow from the receiver preventing demagnetization of the receiver magnets, yet at the same time allowing the voice currents, which are alternating in effect, being received at their maximum value.





THE INSTRUMENT.

The closed cabinet of our common battery telephone covers all working parts as well as all circuit connections so there is no possible danger of electrical shocks, or chance for instrument trouble. The shelf is made to unlock and allows the front part of the telephone to swing down on hinges, fully exposing all working parts for inspection. These telephones like all Dean wall type telephones have our removable lever hook switch.

Address Department B for valuable information on these instruments.

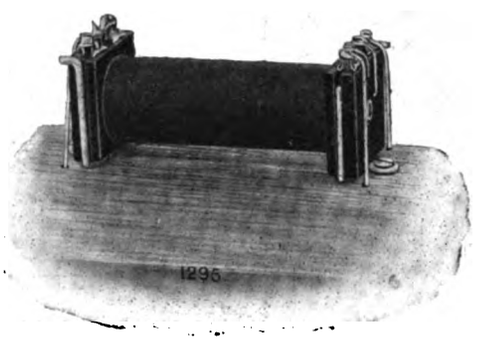
"STROMBERG-CARLSON"

COMPACT TYPE AND "CENTRAL ENERGY" STYLE

BRIDGING TELEPHONES

ARE EQUIPPED WITH

The "Stromberg-Carlson" Generator Call Induction Coil



NO. 20A INDUCTION COIL.

This subscriber's induction coil is one of the most efficient and important parts of a "Stromberg-Carlson" Bridging Telephone.

The large amount of noise produced by an induction coil on short line transmission does not necessarily mean good transmission over long distance lines. The annealed iron wire core and copper windings of our local battery induction coil are so proportioned that transmission over long distance lines is A MAXIMUM FOR CLEARNESS.

The impedance caused by the magnetic leakage produced by the secondary winding of the induction coil in series with the receiver, when the telephone is used for receiving, is kept a minimum, THEREBY PRODUCING VERY HIGH EFFICIENCY AS A RECEIVING INSTRUMENT.

The mechanical construction of the core, primary and secondary windings and spool heads are the best that can be made. The primary winding consists of **Double Silk Covered tinned copper wire**—the secondary consists of **Single Silk Covered Copper Wire**—each layer accurately wound by turns (automatically counted), with layers separated and insulated from each other by one and one-half turns of **oiled paper.** Entire winding is covered by book-binders' cloth. All ends of windings are terminated on tinned metal terminals mounted on spool heads.

Induction Coils mounted in Bridging telephones are held in place by self-adjusting clamps fastening tightly in grooves in each spool head.

The **No. 20-A Induction Coil is first in order of merit** for transmitting and receiving.

We solicit your orders for immediate requirements.

Write either office for prices to-day.

The Williams-Abbott Electric Co.

Cleveland, O., April 10, 1907

TO THE TRADE:

We have sold to the Century Telephone Construction Company of Buffalo, N. Y., our entire plant, including our machines, tools, dies, patterns, etc.

This transfer includes all the valuable improvements developed on Williams-Abbott apparatus during our ten years active connection with the telephone business, during which time, our patrons will agree with us, we have built up a line of apparatus that has an enviable reputation.

We have sold the Century Company our materials, manufactured and unmanufactured, our patents, and the good will of the business. Our patrons can thus get a complete variety of apparatus, both common battery and magneto, and it will be to your interest to deal with one concern.

All orders for repairs and renewals, as well as for additional apparatus of the Williams-Abbott make, should be sent to The Century Telephone Construction Company at Buffalo.

While our factory here in Cleveland was a large one, the new factories of the Century Company at Buffalo are three times as large, and our old patrons will be promptly supplied with the same apparatus as formerly whenever they specify it, as the entire line will continue to be manufactured the same as formerly, and under the same factory foremen, who have moved to Buffalo.

Mr. Wright, who was our sales manager, is now a part of the Century sales organization, and we know that any orders for Williams-Abbott materials will have his personal attention and that they will treat you right.

We thank the trade for the patronage that they have favored us with during the past several years, and which has been the basis for the large business we have carried on.

Yours truly,

THE WILLIAMS-ABBOTT ELECTRIC CO.

L. SANDS, President

KELLOGG

TELEPHONE APPARATUS

ALL KELLOGG TELEPHONE PARTS

Are Made From the Best Grades of Material and Are Carefully Assembled by Skilled Workmen, Thus Making Everything High-Grade Throughout

Kellogg Portable Desk Telephone,
For Central Battery or Magneto Use.

The tubular hard-rubber covered standard, with hollow brass shell, nickel plated base, is distinctively KELLOGG.

The transmitter hinges at top of standard, and there is mounted in base the hook switch and hard-rubber terminal block for receiver and desk stand cords.

The hook switch is of the toggle joint type, having a long motion of the springs, thus obtaining most excellent contacts with only a minimum motion of hook.

All necessary parts are properly insulated, are easy of access and everything is made as nearly dust proof as possible.

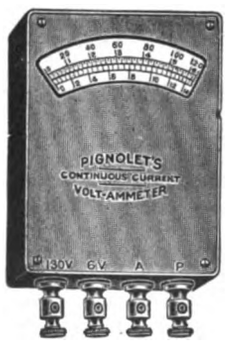
LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

THE WHOLE SECRET

of the success of the AUTOMATIC TELEPHONE SYSTEM lies in the elimination of the girl operators. It cannot be denied that most of the troubles and much of the expense in the manual system (where operators are used) can be charged to the operators themselves.

TRUE ENOUGH,

all operators are not faulty all the time, but some of them are at all times and all of them are sometimes. But "a chain is no stronger than its weakest link," and the average telephone subscriber judges the entire service by the poorest he has received.

IN THE AUTOMATIC TELEPHONE SYSTEM

the fallible human operator has been displaced by an infallible machine, a machine that produces perfect telephone service. With the human operator disappear her faults and her expense. The former are many, the latter not inconsiderable.

THAT IS WHY

the AUTOMATIC TELEPHONE SYSTEM, having no operators, can produce a perfect telephone service, prompt, accurate, absolutely secret, at a much lower cost than for inferior manual service. That is why it is a profitable investment to put your money into an operating company that uses the Automatic Telephone System. Our Automatic Telephone System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.
Battle Creek, Mich.
Beaver Falls, Pa.
Bellingham, Wash.
Butte, Mont.

The Telephone Wire Plant*

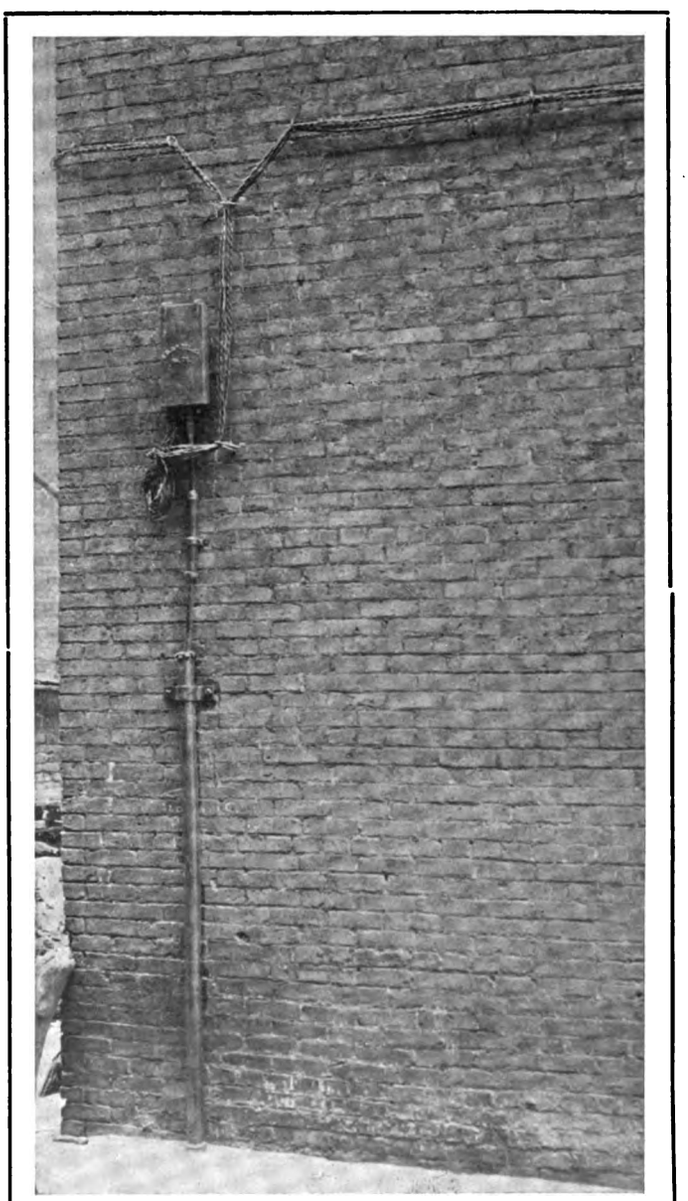
By S. P. Grace, Chief Engineer C. D. & P. Telephone Co.

An analysis of the construction costs of the telephone plant will show that from two-thirds to three-fourths of the total expenditure is required for the outside plant; that is, for conduits, poles, cables and wire. Because of the very large proportional expenditures for the outside plant, it becomes evident that the systems of line distribution should be most carefully studied in order that the best service may be given at the lowest cost.

In considering a telephone plant for a community, the first thing to be done is to decide upon a proper development plan for the growth of the business for a reasonable number of years. In view of the rapid advances in the telephone art and the possibilities of the introduction of new systems of transportation and communication, it would seem that fifteen to twenty years is as far ahead as we are justified in planning telephone development. If the plant is to care for service offered during this period, it must be originally so laid out and designed that the additional subscribers can be taken on without the redesign and reconstruction of the plant. From time to time the development plan can be revised so as always to keep it from fifteen to twenty years ahead of the plant.

In laying out a telephone development plan for a city, there are many things to be considered. The growth in population for the last ten years must be carefully considered; from all possible sources of information a prediction should be made of the population for the next ten to twenty years. It next becomes necessary to determine upon the percentage of development which may reasonably be expected; that is, the ratio of telephones in use to the population. This will vary considerably with the prosperity of the community and whether there are large manufacturing districts employing low grades of labor. It seems certain that this development in the ultimate will lie between 15 and 30 per cent of the total population. A careful estimate must also be made of the ratio of lines to stations. Thus if a very high party-line development is expected, the ratio of lines to stations will be low. To-day the telephone line really means more to us from the wire plant standpoint than the number of telephones. Formerly we used to consider the number of telephones as affecting the wire plant; now it is the number of lines. Because of the introduction of private branch exchanges two or three trunk lines may care for fifteen or twenty telephones, or there may be a number of telephones on one line, so it is the line in which we are interested.

After having looked over the city in a general way and obtained the best available data regarding the industries and the growth of the population in various parts of the city, the next thing to do is to resort to a detailed count of all the buildings, and block by block make an estimate of the number of telephones expected at the end of various periods during the next twenty years. In addition to the count of the present buildings, an estimate should be made of the probable ultimate number of the various classes of structures in each built-up block of the exchange area. In providing for the number of lines to be installed at once, which at the same time should provide for two or three 'years' growth, the present number of lines in each block should be determined and to this number about one-third more lines should be added. This will vary in different cities and must be the subject of a special study in each case.



Sub-duct Cable Terminal and Wiring Runs, in Interior Block Distribution.

*Abstract from paper presented at the 218th Meeting of the American Institute of Electrical Engineers, April 26, 1907.

Digitized by Google

After having made a study of each block in the exchange area and determined the probable number of lines and stations at the end of each five year period during the next twenty years, the entire number of lines and stations as shown by the block map should be summed up and carefully compared with the ultimate figures deduced from the general development

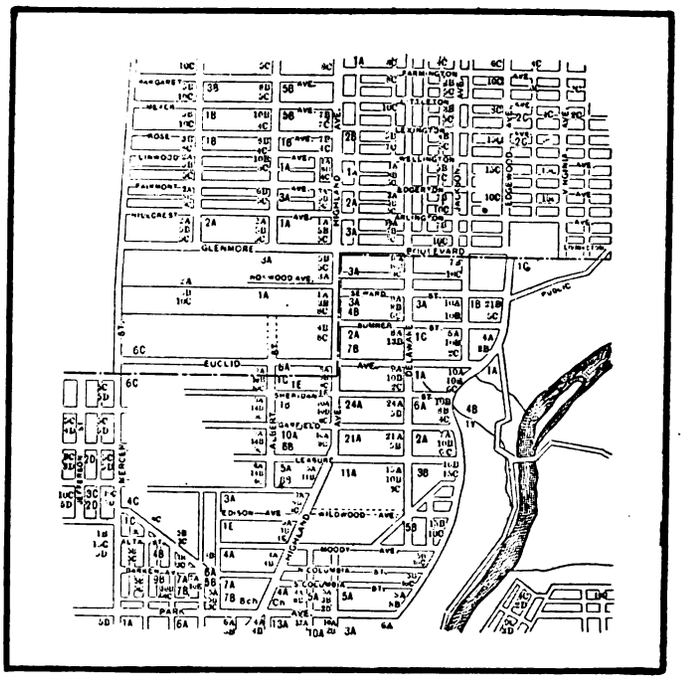


Fig. 1—Development plan. Present ultimate number and classes of houses in each block.

plan which is based upon the character of the city and the probable growth in population. If the estimates arrived at by the general development scheme and the detailed block scheme do not compare favorably, both estimates should be gone into again most carefully to determine the possible errors. In Fig. 1 is shown a section of a city of about 40,000 inhabitants. On this map are marked the numbers of the various classes of houses. At the left of the block in circles are shown present number and at right are shown ultimate number of houses. In Fig. 2 are shown the number in five years and ultimate number of lines in each block.

When the number of telephones in each block for the twenty-year study has been decided upon, it remains to determine the most economical grouping of these telephone lines into exchanges. In small cities where the number of telephone lines in the ultimate will not exceed 8,000 to 10,000, it is reasonably certain to assume that one exchange will prove the most economical. If the district is very much scattered or very much elongated this is not true, and the proper number of exchanges should be determined in a manner to be described later. If one exchange is decided upon, a location for this exchange must be determined which will make the subscribers' line wire mileage a minimum. The determination of this center with extreme precision is a problem for the calculus. The most simple case is when the streets are all rectangular, in which case the mathematical center of distribution is found by drawing lines at right angles through the exchange area, so that the number of telephones in the ultimate on each side of the lines is the same. If the present center is a considerable distance from the ultimate center, a mean center between the two should be decided upon.

When the center is determined, a complete conduit system should be laid out, touching at least one side of every block in the exchange area. It will never be necessary to construct all this conduit at once, and perhaps even in the ultimate much of it will not be installed, but if a definite plan is prepared the conduit extensions from time to time will be of correct dimensions and in the right direction. This conduit must, of course, feed to the exchange center by the most direct routes possible, and the lines should be concentrated in the smallest number of subways which will not affect the efficiency of the distributing system. Since it is known from the development plans the number of lines in each block at the present and the ultimate periods, a skeleton feeder plan of carrying these pairs back to the exchange center can readily be prepared, and from this it is easy to determine the number of ducts and sizes of manholes in the various parts of the subway. In Fig. 3 is shown a typical conduit plan. In general, the terminal cables feeding into the block should be of the ultimate size, while the feeder cables back to the exchange center should be so proportioned as to care for the growth in business for from two to five years. Fig. 4 shows a cable plan for a five-year growth. In the districts where conduit is not constructed, pole lines may be used for distribution and feeder purposes.

In the case of a large city where it is evident that a number of offices will be required to furnish the service, it is a very complex and complicated problem to determine how many exchange districts there should be. The cheapest number of districts will vary as follows:

1. With the grade of talking transmission.
2. With the subscribers' mileage—varies directly as the number of offices.
3. With the *A* and *B* position equipment—varies directly as the number of switchboards.
4. With the multiple jacks—varies inversely as the number of switchboards.
5. With the rent—varies directly as the number of offices.
6. With the office constant—varies directly as the number of offices. This office constant takes care of the equipment which is common to all offices, such as the charging dynamos, storage-batteries and power boards.
7. With the central-office labor—varies directly as the number of offices.
8. With the trunk mileage—varies directly as the number of offices; also on number of calls per line and per cent of trunking.

Good telephone service is fundamentally based upon good talking efficiency. The means for transmitting the talk is what the telephone company really furnishes to the subscriber. In

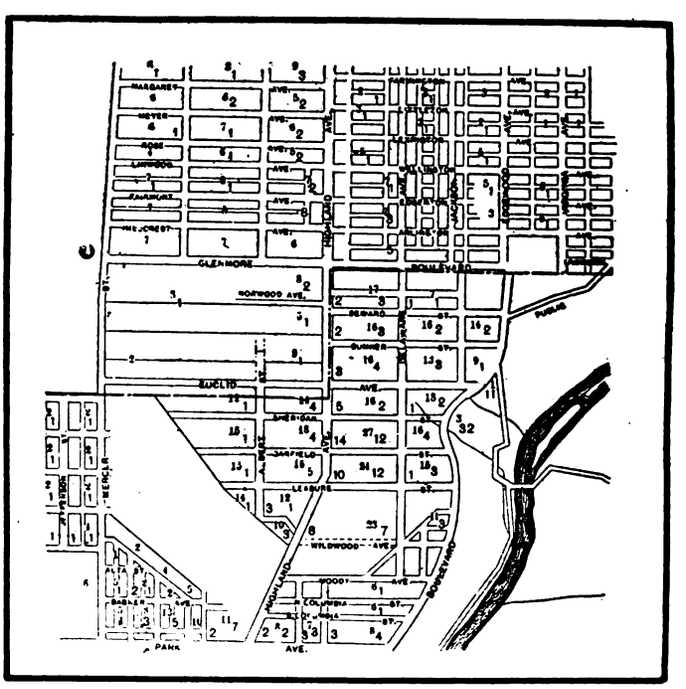

Fig. 2—Development plan. Number of lines in five years and ultimate number of lines in each block.

very large city districts, because of the distances between the central offices, the cost per message is materially increased on account of the high grade trunk plant required to give the subscribers good transmission. The central battery system of subscribers' lines has proved very efficient and economical from

Digitized by Google

service and maintenance standpoints. There is, however, a considerable loss introduced into each line by the ohmic resistance which operates to cut down the flow of current through the transmitter. In addition, then, to the attenuation loss present

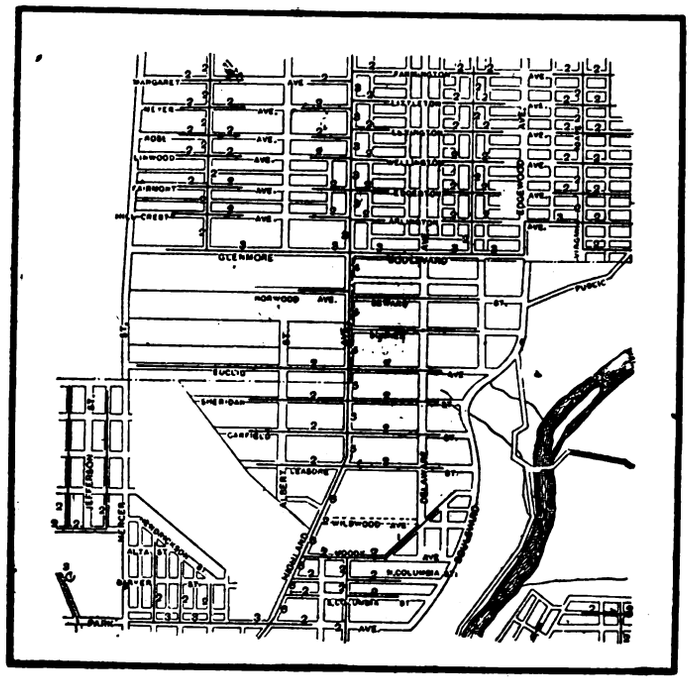

Fig. 3—Development plan. Typical underground conduit layout.

in all cases we have added to this in the transmitting loop a loss due to the reduction of the current through the transmitter.

In designing the subscribers' lines, 22-gauge cable should be used as much as possible. In the case of a large city with a number of central offices there is a limiting resistance for the subscribers' lines which cannot be exceeded without making the trunking plant very expensive. This limiting resistance of

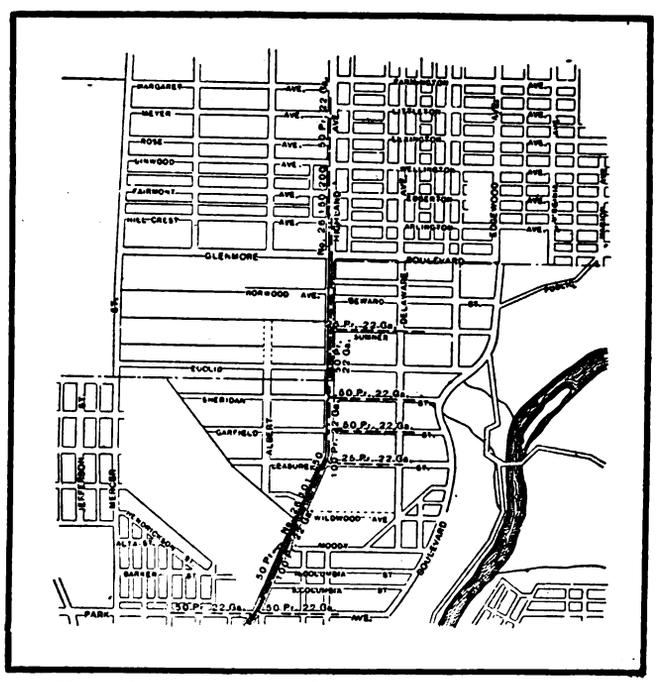

Fig. 4—Development plan. Cable plan for five years' growth.

the subscribers' line will vary in different cities because of the varying distance between central offices which affects the trunk line mileage. In general the subscribers' and trunk line plant must be so designed that, while there will always be good talking transmission between the subscribers, the annual charges on both the subscribers' and trunk line plant will be a minimum.

To lay out a city in the correct number of districts all the items above mentioned must be given careful consideration. From past experience it is generally possible to predict approximately the number of districts which will be found most economical. A number of districts above and below this value should be decided upon, and the costs and annual charges for each of these three groupings should be carefully calculated. The first cost and annual charges of all the variables given on preceding pages must be known in order to make these com-

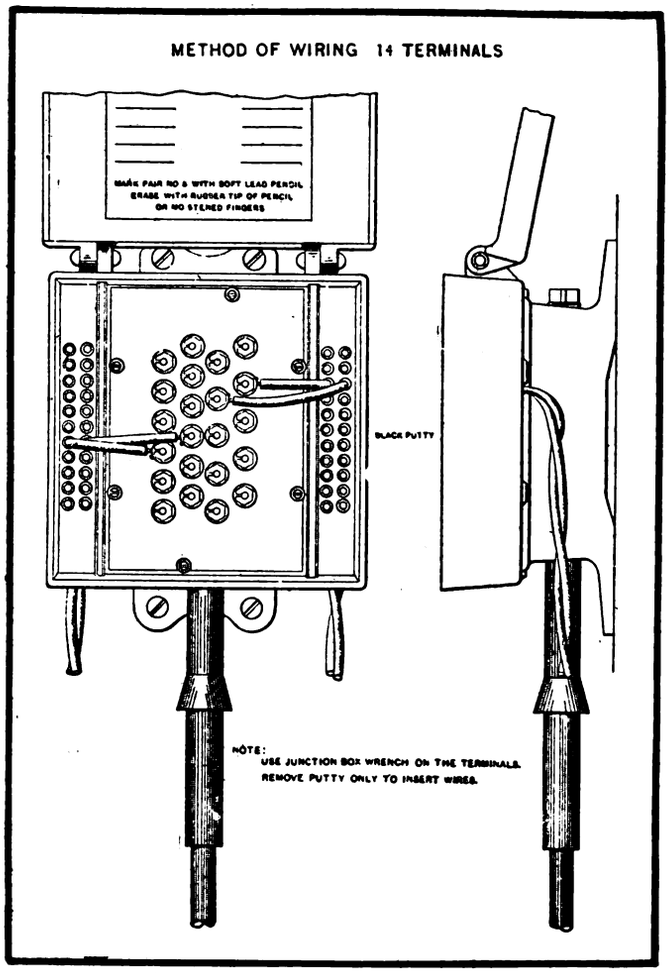

Fig. 6—Wiring diagram of cable terminal.

parisons. Our past experience indicates that the following is about the best theoretical number of districts for cities of various sizes.

	Offices.
For an ultimate of 10,000 lines or less	1
For 10,000 to 15,000 lines	2-4
For 15,000 to 25,000 lines	5-8
For 25,000 to 35,000 lines	6-10
For 35,000 to 50,000 lines	8-12
For 50,000 to 100,000 lines	10-16

After the number of offices has been decided upon, and the conduit study following the general development plan is made, it yet remains to construct the outside plant so as to efficiently and economically connect the subscribers by means of the wire plant to the central offices. Conduits should be built in the congested districts and along what may be considered as main feeder routes. In general it is economical to construct at once a conduit if 400 to 800 pairs of wires are expected within five years. In the vicinity of the underground conduit system every effort should be made to connect the subscribers without resorting to aerial construction. Where the buildings are large and permanent and an average of ten telephones per building may be expected, the best method of construction is a cable directly into each building from the nearest manhole in the main conduit system. In the case of large office buildings one or more build-

Digitized by Google

ing cables should be run vertically in the wire or pipe shafts and terminal boxes provided at each floor, to which can be connected the individual wires for each telephone. The scheme for distributing these individual wires most to be preferred is the hall molding scheme. These hall molding troughs should connect to the terminal box on each floor so that the wires to each telephone may be run from time to time as needed. This system is cheaper to install and easier to maintain than the conduit system following electric light practice. In many cities there are large area ways under the sidewalks, and a cable run through these area ways from one building to another and provided with a tapping terminal on each property makes a very good form of distribution.

Where the blocks in the vicinity of underground conduit are well built up, but where none of the buildings are large enough or important enough to warrant direct connection, the interior block system may be used to great advantage. In this system one or more underground laterals from the main subway system are run into the interior of the block and terminated on the rear walls of the most substantial buildings. Around the interior walls at a height preferably not over ten feet from the ground are cleated lead-covered dry-core cables. At intervals of 100 to 200 feet a multiple tap is taken to terminal boxes. From these terminal boxes 18 B. & S. gauge rubber-covered and braided-bridling wire is carried through bridling rings spaced about four feet apart to the various entrances to the subscribers' premises. This distributing cable is, of course, connected to an underground cable from the main subway. In case the number of telephones within the block is small, a terminal box at the end of the underground cable may be sufficient, and nothing but bridling wires through rings used for distribution purposes. Since no protection is needed between the distributing lines and the underground cable, a very neat form of terminal box may be used. The type of box which is being largely used for this service at the present time is shown in Figs. 6 and 8 of an article which may be found in THE AMERICAN TELEPHONE JOURNAL issue of April 28, 1906. In this box the wire terminals are mounted on hard-burned porcelain. A five-foot length of dry-core lead-covered cable is connected to the terminals on the porcelain blocks, after which the blocks are firmly seated on a gasket of wicking saturated in compound. The cast iron retaining case is then filled with compound, the cable wiped to a brass nipple, and an air-tight plug inserted in the top. This hermetically seals the terminal. On account of the durable nature of the materials employed in the construction of this terminal; namely, porcelain, cast iron and brass, the depreciation and maintenance should be very low.

(To be continued.)

Flat Rates vs. Measured Service

While Preparing a Report on Telephone Conditions in Chicago, Under Instructions from the City Council, the Special Committee of Telephone Experts, Messrs. Jackson, Crumb and Wilder, Had Exceptional Opportunities for Studying the Effect of Measured and Flat Rate Systems of Charging on the Cost and Efficiency of Telephone Service. What They Have Found, and the Conclusions They Draw, Constitute a Document of Great Value and Importance. The Following is an Abstract From the Part of Their Report Dealing With This Subject.

IN order to give the best possible telephone service, the following features should be maintained at the highest possible standard by the company furnishing the service:

The telephone plant should be engineered and constructed along broad lines, and with ample facilities for handling the business and taking care of future development.

There should be provided suitable means for quickly and accurately connecting and disconnecting subscribers' lines.

There should also be provided suitable means for accurately signaling the subscriber desired without the knowledge of any other subscriber.

All lines should be free from inductive disturbances, and of sufficient carrying capacity to provide for a high standard of transmission.

The speech transmitting and receiving devices should be of the best quality, and carefully maintained.

The plant should be well constructed and maintained.

The number of cut-offs which interrupt communications should be reduced to a minimum.

The number of "busy reports" and other unavailing calls should be reduced to a minimum.

All interference with conversation between subscribers should be reduced to a minimum.

The work required of the subscribers should be reduced to a minimum.

All of the plant employed in providing service should be under the control of one corporation or organization.

The company furnishing the service should provide courteous treatment to all of its subscribers, and should promptly and fully follow up and satisfactorily adjust all complaints.

An accurate directory of subscribers' telephone numbers should be provided.

The term flat rates in telephone service ordinarily means the manner of charging for service which consists in making a fixed charge per year for furnishing the subscriber with a telephone instrument in his place of business or residence, and a suitable line or lines and means for connecting, so that he may converse with other subscribers at will. This price is a survival of the idea that a telephone company rents apparatus and telephone lines, and is based upon the theory that the cost of providing service for any subscriber to a particular class of service will be nearly equal to the average cost in that class of service. The subscriber with this arrangement is authorized to make as frequent or infrequent use of his telephone as his requirement or convenience warrants, and all subscribers of the same class are presumed to pay the same price. *The warrant for this equality in the price charged subscribers who may make use of their telephones in widely different degrees, lies only in an assumption that the expense of the service is almost altogether* a matter of providing the lines and the apparatus, and that the cost of providing each subscriber's service is practically independent of the number of times the instrument may be used for communication.

By measured rate service is ordinarily meant a service which is carried on upon the assumption that the telephone company is organized for the purpose of giving telephone service, as distinguished from the renting of instruments and lines. This, in our view, is clearly the proper duty of the telephone company, and any franchise granted to a telephone company should be drawn from this view. The provision of instruments and lines, and the other articles of equipment of the telephone company, is made purely for the purpose of enabling subscribers to transmit messages between each other with the greatest practicable convenience and dispatch. It is therefore the transmission of messages which constitutes the duty of the telephone company, and the measured rates go upon the assumption that the telephone company should be paid for the performance of this specific duty.

In connection with the measured rate service it is, of course, obvious that the company must furnish its subscribers with

Digitized by Google

suitable telephone instruments and lines, and also provide the necessary equipment for making connections to complete the intercommunications between subscribers, and for this reason it is appropriate for a company making measured rate charges to exact a guarantee that there shall be not less than a fixed minimum number of messages or that the rate paid for service at each telephone shall not fall below a certain reasonable amount per annum. This amount will include the transmission of messages up to an appropriate number, over and above which an additional small charge may properly be made per message.

The ideal method of charging for telephone service is obviously to charge each customer in proportion to the service he receives from the company, and to make the charges of all customers as low as is consistent with the operation and maintenance of the property, and the payment of a fair return on the money invested. When flat rates are charged, two classes of customers are ordinarily differentiated, namely (a) business customers, and (b) residence customers. In each class there may be subdivisions due to the arrangement of individual customers on a single line or two, three, four or more customers on a party line, but none of these subdivisions can be made except on the basis of differences in the amount of equipment required for each customer. It is true that the differentiation between a business customer and a residence customer, which is oftentimes made, is justified on the ground that the residence

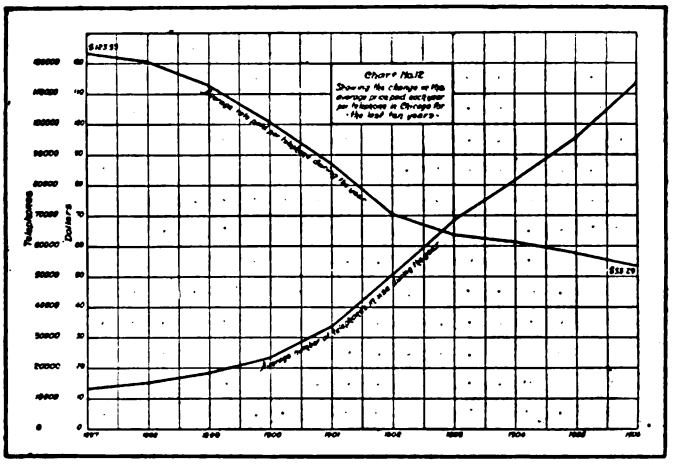

Chart No. 12.

use of telephones averages smaller than the business use, but no grading as between the different business establishments, or between one residence and another, can be made by that process when flat rates are adopted as the method of charging the subscriber. *The result of this obviously must be that, assuming that a company's total receipts are sufficient to pay for the cost of operating and maintaining its property and paying interest on the money invested, to give some of the customers on the flat rate a great deal more service than others receive, so that the smaller users manifestly pay more than their service should require, while the larger users who keep their telephones constantly busy, receive a service of much greater value and expense to the company than is justified by the annual bills which they pay.* These large consumers under the flat rates also interfere with the traffic of the smaller users by keeping their lines so busy that the smaller users are unable to conveniently get into conversation with the busy lines, thus causing unavailing calls for connections which are expensive to the company and annoying to the customers.

The greatest range of rates that it is possible to make with the flat rate arrangement is relatively small, the difference between the highest paying flat rate customer and the lowest paying flat rate customer being comparatively small, and this tends to retard telephone development and prevent its general use.

The measured rate arrangement manifestly makes it possible to reduce the price of the telephone to the small user to the smallest possible annual charge, that is, to a charge which is just sufficient to cover a reasonable interest and depreciation for the portion of the plant that must be set aside for the use of that individual user (or the average of the users in his

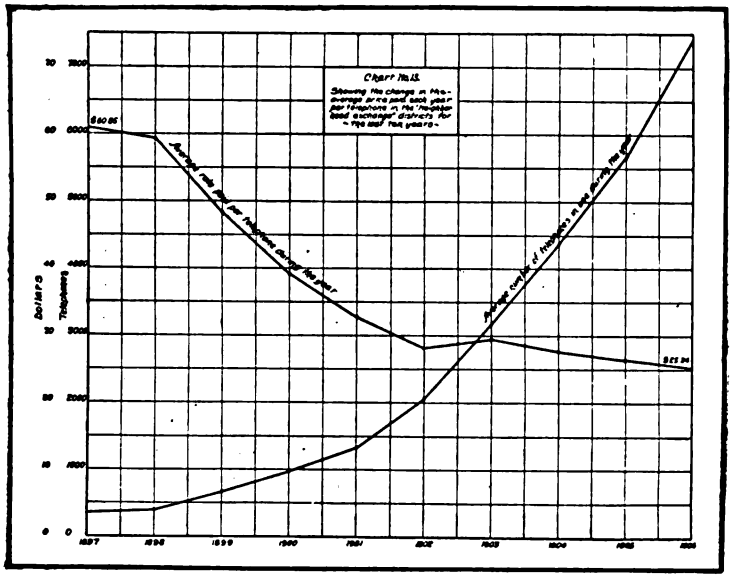

Chart No. 13.

particular class), increased by an amount which is proportioned to the actual number of messages transmitted from his telephone in the year. It is only by this arrangement that large city service may be extended to the small business men and the small residence and apartment dwellers who may be unwilling to pay more than from $18 to $24 per year, and this sort of customers constitutes a remarkably large proportion of the total telephone-using population of a large city like Chicago. When the measured rates are introduced exclusively, and carried to their logical conclusion, it may increase the cost of telephone service to the largest business users, but these users are even then charged no more than the actual service rendered to them costs the company, plus an appropriate amount to represent interest on the investment; and it is an obvious business principle that each class of service should not only be satisfactory to the users, but should also return its reasonable

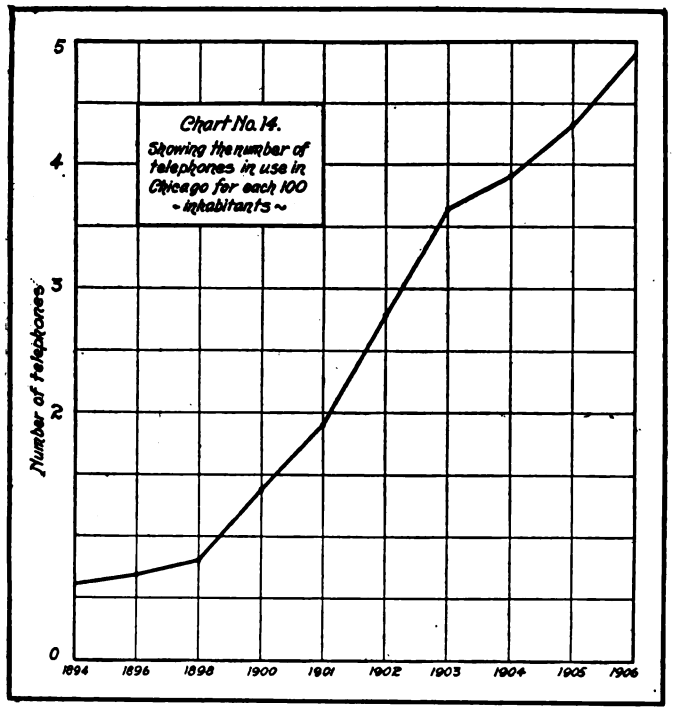

Chart No. 14.

proportion of remuneration to the company furnishing the service.

In the discussion below we have endeavored to point out by

Digitized by Google

the use of charts some of the features pertaining to the flat rate and the measured rate, so as to show the way in which the measured rate tends toward the diffusion of telephone service, which makes it of greater advantage to the people of the city, considered as a whole, while the flat rate tends toward its contraction.

Charts showing the growth of population of the city of Chicago in the past, and the estimated future growth, have been prepared, and the indication of the curves is that the population of the city will be not far from 5,000,000 inhabitants in 1928, and that it will probably exceed 5,000,000 inhabitants by as much as a quarter of a million by the opening of 1929. It may be expected that the population at the opening of 1929 will be certainly not less than 3,750,000. At the present time (1907), the telephone development in the city of Chicago shows between five and six telephones for each 100 inhabitants. It is our opinion that this development will expand with improved and cheaper service, until there are at least ten telephones for each 100 inhabitants, and the telephone development which must be planned to occur before the opening of 1929, should be made with a view of providing the system with as many as 500,000 telephones and perhaps 600,000 telephones. Four hundred thousand telephones is too low an estimate to be reasonable, especially in consideration of the fact that a first-class and cheapened service is likely to increase the number of telephones beyond ten per 100 inhabitants, and may increase the development to a point where as many as fifteen telephones will be introduced to that number of inhabitants. Charts Nos. 12, 13 and 14 illustrate the way in which the telephone development has heretofore increased as the price of service has fallen. The consideration of the manner of charging must therefore be made with due prevision of the tremendous number of telephones that an operating company will be called on to provide within a few years. It is our belief that the number of telephones in the city of Chicago should exceed 300,000, and perhaps exceed 350,000, when the population of the city is about 3,500,000. Within twenty years, as we have pointed out, 400,000 is too small an estimate of the number that should be in use in the city of Chicago, and the number may exceed 500,000. These estimates are founded on the presumption that a franchise will be granted to a company with conditions requiring adequate service over the entire city.

The growth of the number of telephones in the city of Chicago is shown by the Chicago curve on chart No. 4 to now be going on at a rate of nearly 30,000 telephones per year, and the development has been going on at an average rate

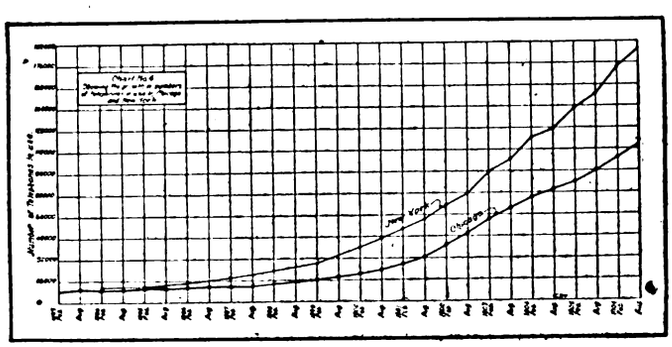

Chart No. 4.

of nearly 20,000 telephones per year for five years. During the next five years we believe that the growth in the number of telephones will go on at the highest rate yet attained and perhaps the rate will increase, provided the service can be made sufficiently inexpensive for the smaller users, and the quality of the service can be maintained or improved.

Our chart No. 5 indicates the way in which the total number of calls emanating from the telephones in the Chicago exchange district has increased steadily since 1893. For the purposes of this and following charts, a call is counted each time a subscriber takes his telephone receiver from the hook and his signal is answered by an operator. With this increase in the number of calls there has been a corresponding increase in the cost of handling the traffic, and the only way immediately open for reducing the expense is to bring about a reduction in the number of calls. As the number of telephones increases, the calls will increase at a more rapid rate unless every reasonable effort is put forth to prevent useless and frivolous calls from the telephones. *Of the total number of calls each week day, which at present average nearly a million in the Chicago Telephone exchange district, about one-third of the traffic as now*

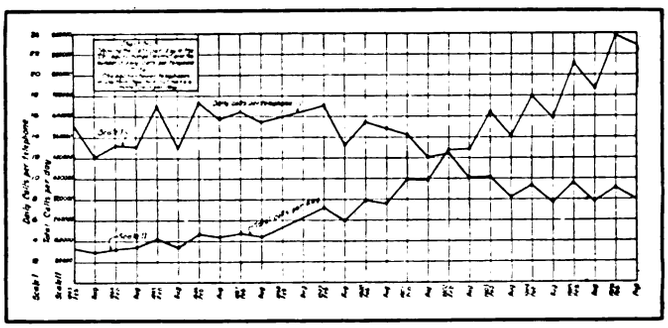

Chart No. 5.

handled constitute unavailing calls, that is, calls which are made by subscribers but prove to be futile efforts and do not mature into messages because the line called for is found to be busy or the called for subscriber fails to answer, or any of the various fertile reasons for the failure of a call to be completed into a message. Each of these calls means cost for the operations performed. To bring about good and cheap telephone service it is necessary to reduce these unavailing calls to the lowest possible number, and especially to reduce the frequency with which called for lines are found to be busy. Such "busy reports" now constitute in Chicago about one-half of the total unavailing calls and are in excessively large numbers, averaging about sixteen per cent of the total number of calls, which is in a large degree due to the tremendous use of the telephones under the flat rates now prevailing. It is obvious from our examination that the Chicago telephone service is burdened by an expensive and undesirable parasite of useless telephone calls which must be removed before the service can be made the most satisfactory and the price of the service can be reduced to a minimum.

The frivolous and useless messages can be largely cut off by making measured rates of service, since even a small charge per message becomes a marked deterrent to the needless use of the telephone. This is illustrated by the line representing the average number of daily calls made from each telephone, shown on our chart No. 5. The number of telephones has been steadily increasing in Chicago, and the total number of telephone calls per day has also been steadily increasing, but the average number of daily calls emanating from the individual telephones began to decrease in 1899 and has decreased from an average approximating sixteen calls per telephone per day to an average **approximating nine calls per telephone per day.** The time that this decrease began is concurrent with the introduction of measured rates, and during the four years while the measured rates were coming into vogue the average daily calls per telephone in the city were steadily decreasing until they have now reached an apparently fixed value that is determined to a considerable degree by the remaining flat rate telephones which involve an over use of the lines.

In these charts it will be observed that a point is marked on each of the curves for the months of February and August of each year, with the exception of the year 1898, during which no records were kept by the Chicago Telephone Company. These points were fixed by what are called "peg counts," taken on one day in August and one day in February to determine the total number of calls coming into the exchange. The counts are made by each operator keeping a record on some counting device of the aggregate number of calls coming to her position during her hours of service, and the total numbers thus given

Digitized by Google

are plotted on our chart No. 5. The average daily calls per telephone are derived by dividing the total number of calls per day upon each of the dates of the "peg counts" by the number of telephones then in use in the city. It will be observed that the zigzag lines representing total calls per day and average daily calls per telephone rise and fall, ordinarily being higher in each February than either of the points corresponding to adjacent Augusts. This is because the telephone business in Chicago is larger in February than in August, since February is a month of great business activity and August is a month during which the business activity is reduced.

It must be borne in mind that in all these charts giving the total calls per day and the total calls per telephone, the data relate to "peg count" calls, which include all of the unavailing calls in addition to those which have become messages, and that approximately one-third of the daily calls in the city of Chicago are unavailing, one-half of the unavailing calls being caused by the over use of lines which are reported busy.

(To be continued.)

BELL SUBTERFUGE EXPOSED IN DETROIT.

THAT Bell interests attempted to take advantage of the negotiations with the U. S. Independent Telephone Company, of Rochester, to shake confidence in the Independent companies throughout the country is well known. The following is the text of a clipping from the Detroit *Free Press* of April 30:

BIG TELEPHONE MERGER APPARENTLY IS A GO.

HOME SYSTEM OF DETROIT AND MICHIGAN SAID TO BE INCLUDED.

NEW YORK, April 29.—Just as the market was closing this afternoon a widely circulated report gained much credence in electric circles and among bankers handling electric securities to the effect that a long-looked-for coup in the swallowing up of the principal independent telephone systems of the country, including the Home Telephone System of Detroit and Michigan, with its Indiana and subsidiary companies, had finally been accomplished by President Frank P. Fish, of the American Telephone & Telegraph Company, in the interest of the big Bell merger.

This report could not be verified at Fish's office by anyone in authority, Fish being out of the city. It, however, accounts for the vast issue of $40,000,000 worth of convertible four per cent. bonds sold last month simultaneously here and in Boston, London, Paris and Amsterdam, as well as the fact that the American Telephone and Telegraph stock, though jumping from 118 the day before the bond sale on March 25, was quoted at 125 Saturday, though but fifty shares were traded in during the week.

General Manager Woodbury took prompt action to set the minds of people in his city at rest, as is shown by the following from the Detroit *News* of May 1:

IN NO DANGER OF BEING GOBBLED UP.

W. B. WOODBURY LAUGHS AT STORY OF BELL OCTOPUS TAKING INDEPENDENTS.

General Manager of Home Telephone Company Shows How it is Impossible For Concern to Sell Out.

"Yes, I have seen the article in the morning paper to the effect that we were to be gobbled up by that octopus," laughed W. B. Woodbury, general manager of the Home Telephone Company of Detroit, and of the $15,000,000 Inter-State Long Distance Telephone Company. "It is a joke," continued Mr. Woodbury, "and if it was not such an old chestnut and had not bobbed up at such frequent intervals, this business of the Bell absorbing the Independent telephone companies, I might take a laugh myself, but the fact is I am getting rather blasé regarding this matter. It is a case of the Press Bureau of the Bell interests getting busy again. The statement that our company in Detroit and other companies in Michigan, together with companies in Indiana, are going to the Bell, is almost too ridiculous to warrant even a passing denial. The Home Telephone Company is controlled by a Voting Trust. This Voting Trust is for a period of ten years and was formed for the purpose of keeping control of the company away from the Bell. It would be impossible for the Home Company to go to the Bell. The same interests that control the Home Company of Detroit are in the controlling interest in the Kansas City Home Telephone Company and the Kinloch Telephone Company of St. Louis are largely interested in the United States Telephone Company of Cleveland, the Cuyahoga Telephone Company of Cleveland, and the Home Telephone Company of Toledo, and are also directly in control of the Inter-State Long Distance Telephone Company, which is a $15,000,000 corporation recently established to give long distance service in Michigan, and to build such exchanges and toll lines as may be necessary to complete the system of telephone communication in this State.

"The Inter-state Company is also controlled by a voting trust, which consists of Max Koehler, vice-president of the St. Louis, Rocky Mountain and Pacific Railroad; C. Marquard Forster, chairman of the Board of the Missouri Lincoln Trust Company, also of St. Louis; Fred T. Moran, Detroit; W. B. Woodbury, Detroit; George E. Lawson, vice-president of the People's State Bank of Detroit, with the Detroit Trust Company as registrar, transfer agent, etc., so it would be impossible to dispose of the Inter-state Long Distance Telephone Company.

"Outside of Detroit, in Michigan, the Bell interests are outnumbered by the Independent, and the local and long distance lines of the Independent are superior in Ohio and Indiana.

"The Bell Company has expended millions in a useless attempt to stifle competition and is to-day paying the freight. The Bell Long Distance has cancelled orders for millions of pounds of copper which the Independent telephone companies have bought eagerly in the present stringency in copper. So, considering all the facts, this, as I say, makes the story of the Bell interests gobbling up the Independent telephone companies around the country rather amusing, especially in view of the fact that the investment in Independent telephone property aggregates nearly $400,000,000, which is in excess of the investment by the Bell interests. In many States in the Union there is little or no field left for the Bell, and there are many cities in Ohio, Indiana and Michigan which have absolutely no Bell service, and the likelihood is there never will be.

Not only was the first clipping published at Detroit, but also in Indianapolis, Milwaukee and many other places, the name of the local Independent company being inserted in each case.

It is authentically reported that the article was inspired by the Bell Press Bureau and distributed through the Laffan service of the New York *Sun*, and not through the Associated Press.

Independent companies should not fail to see that such unjust reflections on their standing are promptly contradicted in local papers as soon as they appear.

AN OPERATORS' SCHEDULE CHART.

By R. B. FEGAN.

Many telephone managers are familiar with the advantages of having a chart posted in the operating room, which will show how long each operator must work and between what hours; but the scheme has not been put in operation in all exchanges. Thinking that perhaps the chart which is used in the exchange of the Ithaca Telephone Company, Ithaca, N. Y., may be interesting to some readers of American Telephone Journal a copy of it is reproduced herewith. By looking at it any operator can become familiar with her hours. Its use has been found to bring about good results. One particular advantage to the company is that in case an operator reports herself ill the chief operator can, by reference to the schedule, immediately pick out a substitute who can do the necessary work with the least possible inconvenience.

Operator's Schedule Chart.

NEW TELEPHONE BUILDING FOR KEOKUK, IA.

LAND for its new exchange at Keokuk, Ia., has recently been purchased by the Mississippi Valley Telephone Company in an excellent location. The plans include the latest ideas in telephone exchange construction. Arrangements have been made for the most satisfactory and economical housing of the switchboard, terminal apparatus, power plant, etc.

INDEPENDENTS WARNED AGAINST DUAL TOLL LINE CONNECTIONS.

OFFICERS of the Independent Telephone Association of Indiana have been led by the urgency of the local situation, created by the offers of the Bell sub-license agents, to issue an urgent warning against taking up any proposition for dual toll line connections. It is set forth that the Bell company has never officially agreed to abandon all its exchanges in Indiana, and the Association has not approved any arrangement for dual toll connections.

Under these circumstances the signing of any agreement to take over a local Bell plant for the purpose of obtaining its toll connections would cause the Independent company to waste a great deal of money, with the sole effect of impairing its position in the field. Full information concerning this latest development of telephone affairs in Indiana will probably be available shortly after the convention next week. In the meantime leading telephone men in the Indiana Association are urgent in their request that individuals shall give no consideration to such propositions as may be made by sublicense agents. They should take up such offers as have been made in the general conference on this matter at the convention.

LINE-UP AGAINST PROPOSED NEW YORK TELEPHONE LEGISLATION IS URGENT.

SHOULD a bill introduced by Mr. Cuvillier in the New York Assembly on March 14th go into effect, telephone companies will be put under the supervision of the Railroad Commission, and in each town will be compelled to connect with other telephone companies operating competing systems.

As pointed out in a previous statement on this page, the passage of such a measure would work immeasurable damage, not merely to telephone companies, but to those who are now dependent on them for service, and to those others who under natural conditions would become so in the future. The placing of the control of the telephone companies in the Railroad Commission, under the terms of the bill as it now stands, not only involves the supervision of rates, but an implied supervision over all new extensions, thus affecting development in a manner altogether different from the physical connection provision.

At the present time the vigorous policies inaugurated by the Independent telephone companies of New York have resulted in good service for many telephone users in all but a limited section of the State. Not only this, but rates have been made low, and as a consequence of this policy, and diligence in seeking after new business, telephones have been put in many residences and business establishments which but two or three years ago could not be made to realize that the service, which they would not now give up under any circumstances, could have any value for them. Thus the value of telephone instruments to each user has been increased to an extraordinary degree.

This question of State supervision as now proposed is a broad one, and of great concern to both telephone companies and to the people at large. If the bill is passed it will hinder development by substituting red tape methods for individual initiative, and the resultant prompt action; also by making it extremely difficult to raise money to provide for extensions necessary owing to the continued demand for adequate telephone service.

Physical connection by putting lines of a well developed local company at the service of a competitor which may have some advantage in the matter of long distance lines will have the same practical effect as the confiscation of the property of the local company. This will be especially true should the division of compensation for toll messages be effected on approximately a mileage basis.

In the absence of competition there will be no incentive to keep service at the highest efficiency, and it is bound to fall off in value. The remedy which will lie in the hands of the Railroad Commission will be extremely slow in action, and not nearly as efficient as the effect of free competition. The slackened rate of growth which will undoubtedly ensue will cause existing systems to fail to reach their condition of highest value to subscribers, due to a high percentage of development, which puts many telephones at the disposal of each individual user, as may reasonably be expected to occur in a comparatively short time under present conditions. Managers and stockholders of Independent companies have the matter squarely before them, and should lose no time, not only in setting forth the condition to their senators and assemblymen, but in seeking the co-operation of influential persons who can be made to realize how the interests of telephone users will be damaged by the passage of this bill.

BREAKING IN GREEN MEN.

IT is an unfortunate fact that the average young man who starts in the construction, installing or maintenance departments of a telephone company is not only very poorly qualified as an electrician, but is likely to be equally deficient as a mechanic. The only thing which can furnish a basis for his training is his ability to quickly acquire a knowledge of things which will be useful to him, and his natural ambition and liking for the business. Without these two qualities he has no right to be working for a telephone company.

Once he gets it firmly fixed in his mind that his advancement depends in the first place on doing his work so well that it will never have to be done over, and then on making a good record for putting in his work at a low cost per job, he may begin to see his way clear to go ahead. He will learn incidentally that economy is attained not merely by working rapidly on a job, but by planning his work in advance, to cut down time expended in traveling, collecting stock, and reducing the amount of material used to the lowest point. By the time these things are well settled, the new man will have a chance to look around and see what there is in a telephone plant. He will be ready to look over the apparatus and ask questions about it. If he has shown himself to be the right sort the head of his department will make no mistake in putting information about circuits and the operation of the apparatus at his disposal as fast as he is ready to take it up. If each thing with which he comes in contact is carefully explained while he is actually working on it, and he is encouraged to ask questions about the rest, his progress will thenceforth depend on his own ability and amount of initiative. It will probably be more substantial, and a truer index to his real worth, than if any plan of forcing were adopted.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

TAX SYSTEM IN IOWA.

Will you please tell us what is the method employed by the State of Iowa for taxing telephone property, and in what respect it differs from the Kansas method? A. A. C.

THE taxing system of these two States is in principle the same. In each State the assessment is made by a State board instead of by the local assessing officials, and is based upon the supposed actual value of the property. The State board which makes the assessment is called the Executive Council in Iowa, and in Kansas is known as the Board of Appraisers and Assessors. In each State the total value is apportioned among the several counties through which the line runs, in accordance with the length of line in the county. In Iowa the actual value per mile is obtained by dividing the total value by the number of miles; then the taxable value is got by taking the percentage of actual value, and the ratio between the actual value and the assessed or taxable value is supposed to be the same as in the case of property of private individuals. The Executive Council then multiplies the taxable value per mile by the number of miles in each county and certifies the result to the county auditors. In Kansas, the value of the real estate is deducted from the total value, and the result is apportioned among the several counties through which the line runs in the ratio that the length of the line in the county bears to the length of line in the whole state.

PROVISIONS OF KENTUCKY CONSTITUTION DO NOT APPLY TO PREVIOUSLY CHARTERED COMPANIES.

Our company operating in Kentucky has had a charter for twenty years. The City Council now seeks to make us purchase a new franchise from them on the ground that we are operating without their consent. Any information concerning our rights will be gratefully received. We supposed we had a valid and binding contract with the municipality. J. W. A.

THE Kentucky Constitution (Section 163) provides that no telephone company within a city or town shall be permitted to erect its poles therein without the consent of the proper legislative boards being first obtained. But this section, by its terms, does not apply "when charters have been hitherto granted conferring such rights and work has, in good faith, been begun thereunder." Unless there are other elements in the constitution which we do not understand, your rights ought to be safe and secure.

OBJECTIONABLE FEATURES IN AGREEMENT FOR EXCHANGE TELEPHONE SERVICE.

A PROPOSED contract between two farmers' lines in the State of Pennsylvania has been called to our attention. Two clauses in this contract are all that is material to this discussion. These clauses are as follows:

The association will give service to the company over its lines, and those of connecting companies who do not charge for same, without cost or charge.

Neither party is to accept subscribers in the district of the other, or accept or give service to any company unfriendly to the other, except by mutual agreement.

This agreement is to run for a period of five years unless changed by mutual agreement.

Two objections have been raised to these clauses by one of our correspondents and they both hold good. As to the first clause, it is suggested that the company presenting the contract desires it to run for a period of five years while they, themselves, have contracts with connecting Independent lines for a period which might terminate some years before the contract quoted would expire. Under such an arrangement as this, the company having the contracts with connecting Independent companies could have free service over the entire line of the other party for a period covered by the term of the contract, but their contracts with other Independent lines might in the meantime have expired and their service be confined to merely their own exchange.

The second clause, it is suggested, looks innocent, but the section of country in which the two companies are located is practically covered by small country lines which might refuse to accept service with the company presenting the contract from which the above quotations are made. This might result in one of the parties being called upon to refuse service that to it was unsatisfactory, but to the other company was unfriendly.

The first difficulty might be obviated by making the period the contract is to run equal to the authorized period any of the connecting Independent line contracts are to last. Another possible improvement could be made by inserting a proviso in the contract that it should become void in case one of the parties severed connections with any of its connecting Independent lines. The second objection, it would seem, would be difficult to remedy unless all of the small country lines in the section would come to a preliminary agreement.

LAND OWNERS' RIGHTS WHEN WIRES CROSS BUT NO POLES ARE SET ON HIS PROPERTY.

A RESIDENT of Buffalo, N. Y., sued the Frontier Telephone Company in ejectment, complaining that the company stretched a wire over his premises, but without placing any poles thereon. The wire was removed by the company after the suit was brought. The court found that the question was a new one, but held that the plaintiff, being the owner of the land, "even to Heaven," was entitled to recover. This case decides that there is no limitation to a person's ownership of land within the bounds of any structure yet erected by man. The removal of the wire after the suit was brought was held not to interfere with the action. Butler vs. Frontier Tel. Co. (N. Y.), 79 N. E., 716.

DEPOSIT REQUIRED FOR UNDERGROUND WIRES.

AN ordinance of Louisville, Ky., requires the Home Telephone Company to deposit five dollars to cover damages for every 75 feet of street turned up in conduit construction, and also to give a blanket bond of $15,000. To obtain a construction of this ordinance a suit was arranged between the company and the city in which a decision has been reached partially favorable to each side. The contention of the company was that the requirement was an impairment of the contract contained in the company's charter, as the city received $10,000 for the franchise and a bond of $10,000 to protect it against damage. The court held that the deposit required for each 75 feet of wire put under ground was legal and covered by a clause of the contract permitting modifications.

The extra bond of $15,000 was held to be a duplication of the former bond of $10,000 and was invalidated by the decision of the court.

QUERIES

DIMENSIONS OF GAS ENGINE BELT.—(857.)

We run our charging machine with a gas engine, and in ordering the engine a mistake was made in the size of the flywheel which, being larger than was expected, causes the generator to run at a greater speed than that for which it was intended. We therefore are going to change the pulley on the generator which is four and a half inches for an eight-inch one. As we will be obliged to order a new belt also we would be pleased to have you advise us as to the correct length of the belt to order so that we may have no trouble in setting it up when it arrives. H. R. R.

As you have not given us the diameter of your gas engine flywheel or the distance the machines are apart we are unable to advise you of the exact length of belt to order; however, this you may readily ascertain by the following rule as given by Kent who is an authority on matters of this nature.

To find the length of belt required for two given pulleys, add the diameter of the two pulleys together, divide the sum by 2, and multiply the quotient by 3¼ and add the product to twice the distance between the centers of the shafts.

Thus you will add 8, which is the diameter of the new pulley, to the diameter in inches of the flywheel of your engine, dividing the sum by 2, then multiply by 3¼ to which you add twice the distance, in inches, in a straight line from the center of the pulley shaft on the generator to the exact center of the flywheel. This will give you the length of belt necessary, in inches.

HOWLER CIRCUIT USING ELECTRIC LIGHT CURRENT.—(858.)

We have tried a number of Howler circuits as shown from time to time in the various telephone publications but have not seen one which just suits us. Will you not suggest one that will give positive results at all times without costing too much, or being likely to get in trouble frequently? Is there not some manner in which A. C. electric light current might be utilized for this purpose?

W. O. Y., *Michigan.*

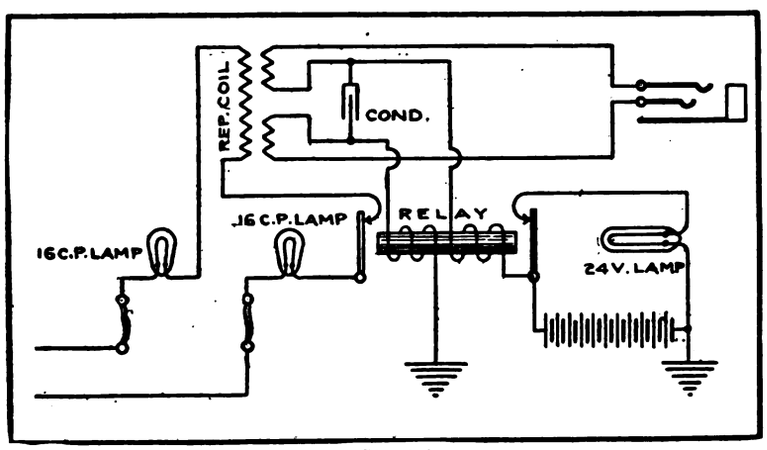

Fig. 858.

One method by which electric light current of an alternating nature may be used as a howler is shown in Figure 858, and may be put in shape with very little trouble or expense, using material which may ordinarily be found in any common battery exchange. The necessaries are two sixteen candle-power, 110 volt lamps, one repeating coil, one 4 M.F. condenser, one double wound relay, one switchboard lamp and one switchboard jack.

In the majority of common battery switchboard circuits the battery is supplied to the line by means of the cord circuits when the plugs are in the line jacks, therefore it will be necessary to note which side of your plug carries the positive side of your battery and arrange the connections of your relay accordingly. The method of operation is then very simple. The subscriber leaving his receiver off the hook causes the battery on the line to flow through the primary side of the induction coil and transmitter to the office and hence through his line relay which causes an actuation of the relay and causes his line signal to show.

The operator upon placing a plug in the line jack cuts out this line relay in the customary manner thus restoring the signal to the unoperative position; then upon ascertaining that the subscriber has left the receiver from the hook, she takes the other plug of the pair and inserts it into the howler jack. The battery current on the line then completes its circuit through the howler relay, thus energizing it and actuating the two armatures, one of which closes the circuit of the alternating current through the repeating coil and the other completes the circuit in which is included the howler supervisory lamp. Owing to the practical short circuit existing at the subscriber's instrument which allows the passage of the battery current the howler relay will remain energized so long as the receiver is off the hook and the alternating current will cause a "howl" in the subscriber's receiver.

Immediately the subscriber restores his receiver to its proper place the circuit will be broken, the relay will become de-energized, and the armatures will return to their normal positions, thus opening the alternating current circuit and also that in which the supervisory lamp is included. Thus the operator is immediately advised of the restoring of the receiver and then removes the cords from the jacks.

The sixteen candle power lamps in series with the repeating coil are simply resistances to cut down the current.

POLARITY OF STORAGE BATTERY PLATES.—(859.)

Will you kindly tell me how to determine the polarity of the plates of a storage battery?

The best indication of polarity is the color of the plates. The positive plate is a light brown when discharged and of a chocolate color when charged, while the negative varies from a dark to a light slate color. A very simple test and one that is certain is to dip wires attached to the terminals of the battery into dilute sulphuric acid, the one from which the most bubbles rise being negative.

EFFECT OF RESISTANCE OF BELLS ON RURAL LINES.—(860.)

On a rural line do bells of a high resistance have a tendency to increase the talking efficiency of a line? A. F.

On a heavily loaded rural line a greater talking efficiency would be secured if bells of a high resistance are used. This is not due to any helping effect of the bells on the line, but simply owing to the greater resistance encountered by the current passing through the bells. That is, a bell of a high resistance will not absorb as much of the talking current as would one of lower resistance.

The object in using the high resistance bell on a line is not only to facilitate the talking qualities of the line but also to enable the bells to ring more readily. This is possible with bells of a high resistance owing to the fact that there are more turns on the coils and therefore as great a current is not necessary to cause an actuation of the armatures of the bells. On rural lines having a large number of instruments attached it is customary to use ringers having a resistance of 1,600 ohms; however, if the lines are very heavily loaded, bells having a resistance of 2,000 ohms will give more satisfactory service.

NO LEVERS TO PUSH OR PULL

GRAY TEL. PAY STATION CO.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE.—We offer for sale the following assortment of Stromberg-Carlson Central Energy telephones displaced by our installation of Automatic equipment:

250 Type E central energy desk telephones with stationary head, corrugated nickel-plated pedestal, black enamel metal base, bipolar receiver, gold electrode transmitter.

1,000 No. 204 desk telephones with adjustable transmitter, knuckle joint arm, nickel-plated pedestal and base, same transmitter and receiver as above.

100 Type C. E., latest style desk telephone with No. 4 transmitter, all rubber bipolar receiver, black rubber pedestal, nickel-plated base, induction coils at end of cord instead of in base. A modern instrument.

1,000 Former type ZZ, later known as No. 37, business style central energy wall telephones complete with triplet set consisting of combined switch-hook, transmitter with adjustable arm, bipolar receiver, etc. This instrument is provided with shelf.

100 Former type Z, later known as No. 35, residence style, central energy wall telephone without shelf, otherwise same as No. 37.

These instruments are in good condition and will be sold at a reasonable figure. Prices will be furnished upon application to W. F. LAUBACH, Manager, Akron People's Telephone Co., Akron, Ohio. 822

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED.—Competent man as superintendent, also first class switchboard repair man. Good salary for first class man. None other need apply. Address, Box 821, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 821.

WANTED---Continued

WANTED.—The management of an electric light plant where the business can be built up. Have had experience and can "deliver the goods" on any electric lighting proposition. Open for engagement after July 1, 1907. Address Box 816, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 816

POSITION WANTED—A first class man wants to make change. Would like position as Manager or Wire Chief. Twelve years' experience. A-1 reference. Address, Box 825, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 825

WANTED—To operate small country switchboard not over 100 line, with living rooms on the premises. 12 years' experience. Address Box 823, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 823

WANTED—Position by good troubleman experienced in line, office, and instrument trouble. In other respects am willing to render myself generally useful. Satisfactory testimonials. Address Box 828, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 828

SITUATION wanted by experienced man as wire chief or switchboard repair man and troubleman for common battery plant. Address Box 830, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 830

POSITION WANTED—An experienced and capable telephone man desires employment as exchange manager, or any responsible plant or maintenance position. Can furnish excellent references. Address Box 831, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 831

IN THE OPERATING FIELD

LATE OPPOSITION TO GRANTING OF INDEPENDENT FRANCHISE AT JACKSON, MISS.

MISSISSIPPI has recently been the scene of some very lively and interesting discussions of telephone matters. The State Railroad Commission has been criticising the Cumberland (Bell) company on account of its alleged poor service, and the idea of Independent service has made rapid gains in the public estimation. At Meridian and Hattiesburg there are two flourishing Independent exchanges, the first having over fourteen hundred subscribers, while the latter has seven hundred. The Independent company at Hattiesburg has only been in operation since the first of this year, while the one at Meridian has been in operation little more than one year. The same interests which control these exchanges have recently secured a franchise at Jackson, the State capital, and have applied for a franchise at Vicksburg. The company, after building local systems in these cities, intends to build long distance lines connecting them together, and also to connect with other important long distance lines and exchanges which are now being built up throughout the South.

At Jackson the situation at the time the franchise was granted was especially interesting. A correspondent thoroughly familiar with the situation writes that "the franchise here was granted so quietly and with so little local opposition that the Bell company apparently did not know what was going on, and only woke up when the ordinance had been passed. A campaign was immediately instituted by the Bell interests to have the franchise repealed, and it promised to do about anything that the city wanted done, including the installation of free city service, putting wires underground, giving 3 per cent. of the gross earnings to the city, etc. Previous to this it is reported that the company had refused to give the city a single free telephone, and had notified the governing officials that it intended to raise its rates to all subscribers."

"After the franchise had been granted a convention of all Mississippi managers of the Bell company was held in Jackson, evidently more to create public sentiment than for any other reason, as most of the talking was done by the higher officials, telling how they loved the dear public, how they wanted to please them, etc. The city council had another meeting on the 11th inst., at which it voted unanimously to let the franchise stand as granted, showing that all efforts of the Cumberland company were unavailing."

COLORADO TELEPHONE COMPANY ENDEAVORS TO STRENGTHEN ITS POSITION BY ISSUING STOCK TO DENVER SUBSCRIBERS.

A NEW departure for a Bell company, and one of special significance, is that inaugurated by the Colorado Telephone Company, as set forth in a circular recently issued by President E. B. Field to Denver subscribers. It seems that on March 12 a certain amount of the treasury stock was offered to the stockholders, and six thousand shares of the par value of fifty dollars each were not taken at the time the subscription was closed. The company apparently was awake to its opportunity to do a good stroke of business in two directions at the same time, and it is now offering these six thousand shares to the subscribers at par.

The circular frankly states that the object in offering this stock is to secure the co-operative influence of the greatest number of its telephone subscribers, as the company thoroughly realizes the value of such influence. It would appear that this Bell company is learning a lesson from one of the principal sources of strength of the Independent companies, and is preparing to fortify its position as much as possible in view of the impending competition in Denver.

INDEPENDENT COMPANY AT NASHVILLE REORGANIZED UNDER NEW LAW, MEETS WITH SPITEFUL OPPOSITION.

AFTER gaining every point it desired, both in the Supreme Court of that State and in the Legislature in the form of new laws, the Home Telegraph Company, which has been trying to enter Nashville, Tenn., for several years, has reorganized the company and changed the name to the Home Telephone Company. The Board of Directors then elected the following officers: R. E. Cooper, president; W. C. Polk, vice president; H. M. Perry, treasurer; Charles Curry, secretary. The capital stock of the company was placed at $1,000,000, most of which was subscribed to by the builders of the through trunk lines from Louisville to New Orleans via Nashville and Birmingham. The conduit ordinance of the city requires the company to place its wires underground, but this offer was voluntarily made by the company when its proposition for a franchise was made to the city council and no objections will be offered. The new company has arranged to begin work on its plant and proposes to have its system in working order within a year.

Although the State law grants the new company every right in any city and the State Supreme Court has decided in the company's favor the Cumberland Company is still carrying on the fight with a determination that is marvelous. The city campaign is about to open and already several candidates have announced that they are opposed to the new company and will place every obstacle in its way. It is proposed now to put up the plea that many of the streets are too narrow for the operations of the company and an effort will be made to exclude it from many parts of the city. The new State law gives the city the right to govern the methods of constructing a telephone system. Being ready to begin its work the Home company filed a request with the mayor for specifications so the work could begin at once. The mayor replied that his term of office would soon expire and he did not care to take part in any further telephone controversies. The Board of Public Works was applied to and there the attorney for the company was referred to the legal department. At the office of the city attorney the company got no satisfaction. Already the telephone matter has been an issue in two city campaigns and will likely be an issue in the coming campaign. Nashville being the home of the Cumberland branch of the Bell company, it is dying a hard death and will not give up the fight as long as it can place a single obstacle in the way of the Independents.

ANNOUNCED RAISE OF RATES CAUSES LOSS OF BELL SUBSCRIBERS AT SHREVEPORT, LA.

SHREVEPORT, LA., is up in arms against the Cumberland Telephone Company on account of a threatened advance in telephone rates. The Cumberland company has announced an advance on resident telephones from $2 to $2.50 and a similar advance on business telephones. The Progressive League took the matter up and petitioned the company to let the rates remain, showing that the company was receiving a good return on its investment. The Cumberland company replied that it would advance the rates on June 1. Thereupon the organization passed a resolution to patronize the Independent company. During the last few days of April the Cumberland company lost over fifty of its residence subscribers and it looks as if it will lose the major portion of them.

TELEPHONE PATENTS

WEATHER-PROOF TELEPHONE.

George F. Atwood, East Orange, New Jersey, patents (No. 847,305; dated March 19, 1907; filed March 12, 1906; serial No. 305,551) and assigns to Western Electric Company, Chicago, Ill., a telephone set.

The inventor's intention is to construct a weather-proof telephone particularly adapted to use on ships, where the instrument may be exposed to inclement weather and the wear occasioned by the uncertain movements of the boat. The set consists of a hand microphone enclosed in an air-tight, water-proof metal cabinet together with the hook of the switch upon which it hangs, the induction coil, ringer movement and other parts. All of the parts aside from the hand microphone are contained within an inner chamber, in order that they may at no time be exposed to the weather even though the door of the case be open.

TELEPHONE REPEATER.

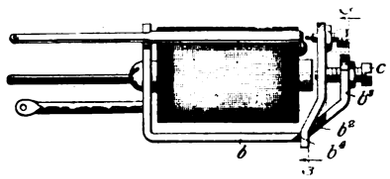
Ferdinand Emile De Faucheux D'Humy, Englewood, New Jersey, patents (No. 847,777, dated March 19, 1907; filed June 26, 1906; serial No. 323,482) a telephonic repeating circuit and apparatus.

This patent describes a form of telephone repeater in which the long distance line is cut at its center of balance, each section entering one side of separate repeating coils. One end of the other side of each of these repeating coils is grounded; the other terminal of the grounded side is connected in series through a microphone relay, thence through one side of another repeating coil and to ground. The second windings of this last repeating coil are in series with battery and the armatures of the microphone relay are connected in series with a microphone relay, and with the primary of a second repeating coil legged to ground. The second windings of these last repeating coils are in series with a resistance, an inductive solenoid and another resistance, forming a closed loop, taps being taken at the center of the non-inductive resistance and attached to terminals of condensers, the other terminals of which connect to ground. The windings of the microphone relays are split and a tap from the center goes through one winding of still another repeating coil having a secondary connected in series with battery and the microphonic contacts of the relay associated with the other side of the line, and thence to ground.

RELAY.

Charles E. Scribner, Jericho, Vt., patents (No. 850,402, dated April 16, 1907; filed March 31, 1906; serial No. 309,060) and assigns to the Western Electric Co., Chicago, Ill., a relay.

This invention relates to a relay having the pole piece *b* formed



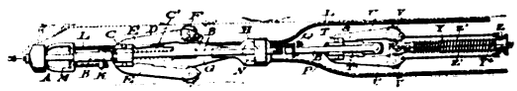
to act as a base for the armature and having the vertical extension b^3, upon which is mounted the armature adjusting screw *C*.

The pole piece *b* and the armature, which has a tongue-and-groove seat on the pole piece, are each provided with knife-edge bearings, which rest one against the other, the object being to reduce to the minimum friction between the moving parts.

CONDUIT THREADER.

Thomas J. Cope, Philadelphia, Pa., patents (No. 850,625, dated April 16, 1907; filed June 11, 1906; serial No. 321,117) an apparatus for threading or laying electric conductors in conduits or pipes.

This invention comprises an arrangement of two wedges, *D* and



S, with rollers *F* and *V*, together with pulleys and ropes so arranged as to allow by proper manipulation of the ropes of first one set of rollers engaging the sides of the conduit solidly, allowing the other roller-bearing portion of the apparatus to move in a forward direction, when it in turn engages the conduit walls, allowing the same motion in the first set. Thus the rollers of the head and tail pieces frictionally engage with the conduit alternately, allowing an alternate forward motion of the pieces, thereby carrying the entire apparatus through the conduit with an attached conductor or leading-in rope of the cable.

TELEPHONE RECEIVER.

Howell W. Haff, of New York, N. Y., patents (No. 843,891; dated Feb. 12, 1907; filed Aug. 27, 1906; serial No. 332,094) and assigns to Kelley M. Turner, New York, N. Y., a telephone receiver.

This patent covers a telephone receiver of the watchcase type equipped with a jack for the reception of a plug attached to the conducting cord. and a switch mounted in the receiver in such a manner as to allow of the circuit being opened readily.

The inventor states that this receiver is designed primarily for use in connection with apparatus for deaf persons.

WIRE CONNECTORS FOR ACCOUSTICONS.

Howell W. Haff, Babylon, N. Y. patents (No. 843,890; dated February 12, 1907; filed March 17, 1906; serial No. 306,584) and assigns to Kelley M. Turner, New York, N. Y., a connection for accousticons.

This patent covers a form of wire connections for use in accousticons in which it may be desired to connect several receivers in multiple.

INSULATED STAPLE.

Walter T. H. Taylor, Brockton, Mass.; William J. Jenks, New York, N. Y., and Richard N. Dyer, East Orange, N. J., patent (No. 843,916; dated February 12, 1907; filed November 20, 1906; serial No. 344,200) and assign to Insulating Staple Co., New York, N. Y., a corporation of New York, an insulating saddle staple.

This invention relates to an improvement upon the insulating saddle-staple covered by patent No. 420,635, granted to Luther Stieringer, February 4, 1890. Threatened lengthwise upon the staple is a strip of thin insulating material, covering both the inner and outer legs of the staple near the head with a single thickness and giving a double thickness under the head of the staple. In making this combination a thin strip of insulating material is doubled, the upper layer only being pierced by the points of the staple.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

NEW WESTON MEASURING INSTRUMENT.

AN instrument which possesses an exceptionally wide range of usefulness in measuring electrical quantities is the new Weston multimeter. The company states that this instrument will quite accurately serve the purpose of a direct current voltmeter, milli-voltmeter, ammeter, mil-ammeter, ohmeter, ground detector and Wheatstone bridge.

The indicating instrument is similar in mechanical and electrical construction to the well-known Weston portable direct current instruments, and is nearly equal in accuracy to any of the separate Weston portable direct current instruments, for which it may be substituted, including the voltmeter, milli-voltmeter, ammeter, mil-ammeter. The only difference from the regular form of these instruments which is noted in the multimeter is that it has a special movable coil, which adapts it to better meet the requirements of the combination of which the indicating instrument forms a part. Combined with the indicating instrument, which has detachable shunts, are a Weston type Wheatstone bridge and a battery of twelve silver chloride cells.

The scale of the instrument has one hundred and sixty divisions, with zero placed at ten divisions from the end, so that when used as a galvanometer in connection with a bridge, both positive and negative deflections may be observed. In the Wheatstone bridge many novel features of construction are embodied. The twelve cells of battery are arranged in a separate compartment. Any cell may be used alone, or several in series if desired. The Weston Electrical Instrument Co., Waverly Park, Newark, N. J., will be pleased to send any further information desired upon receipt of a request.

Weston Multimeter.

THE NATIONAL POLE COMPANY, of Escanaba, Mich., is a corporation which has been recently organized under the laws of the State of Michigan, to take over the business which was formerly handled by the Cedar Department of the Pittsburg and Lake Superior Iron Company, of Escanaba. The officers of the new company are J. C. Kirkpatrick, president and general manager; H. W. Reade, vice president and treasurer, and E. A. Hubbard, secretary. The stockholders in the new corporation are identical with those of the Pittsburg and Lake Superior Iron Company.

The necessity for this new organization arose from the extremely rapid development of the business connected with the marketing of the poles and other forest products taken from the lands owned by the Pittsburg and Lake Superior Iron Company. While the policy and principles which have brought the latter company into such favorable consideration with buyers of telephone poles will be observed in the future, the facilities for the transaction of this class of business will be materially increased and improved. New yards will be established on the Pacific coast, with headquarters at Everett, Wash., and stocks of poles will also be carried in the Eastern States. At the present time large yards have been established at various advantageous points in Michigan, Wisconsin and Minnesota, and with these facilities the new corporation states that it will be able to furnish high grade supplies to its patrons with exceptional promptness.

ALBERT J. COX & COMPANY, 1022-1023 Chicago Stock Exchange Building, Chicago, Ill., have recently been appointed western sales agents of Legler, Grimes & Eilerman, manufacturers of finished or die moulded castings. The name of these castings was assigned them because they are finished when cast, thus eliminating subsequent expensive machine work. The company claims that it is able to duplicate a model so accurately that the variation in any measurement will not exceed one-thousandth of an inch.

In making these castings it uses a standard metal, developed after long experiments, which can be plated in brass, bronze or other styles. Messrs. A. J. Cox & Company invite manufacturers using castings which now require machine work to submit samples, drawing or models, with a statement as to the number used in a year, and desired on each separate order, in order that they may demonstrate their ability to effect economies in this line of goods by giving quotations.

W. N. MATTHEWS & BRO., 219 North Second street, St. Louis, Mo., has just issued a booklet, printed in two colors, which is extremely attractive in appearance, and gives much valuable information. The idea which the company had in mind was to put before buyers of telephone supplies a neat and attractive net price list, which would give in a convenient form information concerning the money-saving specialties which it handles.

The illustrations and printed matter are so arranged that very complete information is given, making it unnecessary to carry on an extended and tiresome correspondence before placing orders. For convenience in reference the front cover is cut off slightly shorter than the first page, and each of the succeeding pages increased in length about one quarter of an inch, thus making it possible to print at the foot of each page an index line, facilitating ready reference. Among the well-known specialties listed in the book are Stombaugh guy anchors, Kearney cable clamps, Lima jack boxes and plugs, Hargis cable splicing, joints, etc.

The company is sending out large numbers of these books and would like to receive requests for copies at the earliest possible date, in order that they may be mailed to those especially interested before the edition is exhausted.

THE GRAEBER-ENTRIKIN MANUFACTURING COMPANY has recently been incorporated for the purpose of manufacturing a new type of telephone pay stations, and various other classes of measured service and telephone equipment. The executive officers of this corporation, which has its headquarters in Philadelphia, are Frederick R. Graeber, president and treasurer; Clarence T. Entrikin, vice president and engineer, and Geo. W. Garman, secretary and general manager. Mr. Graeber is a well-known Philadelphia business man and Mr. Entrikin is an engineer and inventor with a good reputation in engineering circles. Mr. Garman is a thoroughly practical telephone man, has had a wide experience and is thoroughly familiar with the requirements of telephone companies. The company has offices in the Keith's Theatre Building, 1116 Chestnut street, Philadelphia.

THE TRUMBULL ELECTRIC MFG. COMPANY, Plainville, Conn., is putting out a small monthly magazine, which contains some interesting and amusing matter. The last two or three pages are devoted to practical information about the Trumbull switches

THE WEEK'S MESSAGES

NEW COMPANIES.

LOS ANGELES, CAL.—The Southern Telephone Electric Company, whose intention it is to operate in Texas and other Southern States, has been organized. Among those interested are: E. L. Swaine, manager of the Home Telephone Company; J. N. O. Rech, secretary; J. F. Norris, cashier of the Occidental Trust & Savings Bank, treasurer, and R. J. McHugh, engineer.

ALEDO, ILL.—Articles of incorporation have been filed by the People's Telephone Company of Aledo. It has an authorized capital stock of $3,500, and the incorporators are Peter F. Mauck, David N. Blazer and A. G. Reinolds.

LONE TREE, IA.—The East Freemont Telephone Company has been organized with a capital stock of $5,000, the life of the company being fifty years. Its principal place of business is to be at Lone Tree, and the following officers have been elected: J. W. Carey, president; W. J. Kirkpatrick, secretary; F. H. Lentz, treasurer. The directors are: J. W. Carey, W. J. Kirkpatrick, J. R. Guthrie, Athanas Jegie, Edward Mumm.

KIRWIN, KAS.—An Independent telephone company, to be known as the Deer Creek Mutual Telephone Company, has been organized at this city. Its intention is to construct and maintain lines between Kirwin and Dana.

PLANO, KY.—Articles of incorporation have been filed by the Plano Telephone Company. It has an authorized capital stock of $420 and the incorporators are: M. C. Potter, J. D. Wright, of Plano, and W. H. Jenkins and J. F. Hagerman, of Bowling Green.

BREAUX BRIDGE, LA.—The Breaux Bridge-St. Martin Telephone Company has been organized. The new company contemplates the erection of a telephone system in this city, and expects also to build lines to neighboring towns. Work on the plant has already been commenced.

BARRYTON, MICH.—The Barryton Rural Telephone Company has been organized with a capital stock of $10,000 to construct a telephone system in Barryton. Construction of the system will be commenced very soon and connections effected with the Union Telephone Company's lines for State business. The following officers have been named: Henry Walrath, president; Charles Gaumer, vice-president; Dan Wait, secretary and treasurer, and Arthur Denno, manager.

SPRUCE, MO.—The Farmers' Telephone Company has been organized to build lines from Butler to Spruce.

WEST LEYDEN, N. Y.—The farmers between West Leyden and Ava have organized a telephone company to be known as the North Ava Telephone Company and have elected Fred P. Grubel, president, and F. E. Wolfe, secretary and treasurer.

LIDGERWOOD, N. D.—The Lidgerwood Rural Telephone Company has filed articles of incorporation. The capital stock is placed at $25,000, and the incorporators are Louis J. Christensen, John J. Mathews and M. C. Christensen, all of Lidgerwood.

WAYNOKA, OKLA.—Articles of incorporation have been filed by the Lone Star Telephone Company. It has a capital stock of $300, and A. E. and M. A. McGolden are among the incorporators.

BEAVERLAKE, PA.—The Sullivan and Money Creek Telephone Company has been incorporated with a capital stock of $10,000.

WICHITA FALLS, TEX.—Articles of incorporation have been filed by the Wichita Falls and Northwestern Telephone Company, of Wichita Falls. The capital stock is placed at $10,000 and among the incorporators are R. E. and C. C. Huff and William McGregor.

DOTHAN, W. VA.—An Independent telephone company, to be known as the Beckley & Fayetteville Telephone Company, has been incorporated to construct and operate a telephone system at Dothan. It has a capital stock of $5,000, of which $50 has been paid in, and the incorporators are Frank Thompson, E. N. Case, Harrison Toney, J. W. Mahoney and J. W. Coleman.

CARTER, WIS.—The Carter-Wabeno Telephone Company, of Carter, has been incorporated with a capital stock of $4,000. Among the incorporators are N. W. Johnson, A. J. Johnson, E. Hemenway and W. S. Slater.

LANNON, WIS.—Among the newly organized companies is the Menomonee Falls Telephone Company. It has planned to install a local system in this city, and to establish connections with Lisbon and Huberter.

LADNER, B. C., CAN.—The farmers of the Delta municipality have organized a mutual telephone company. The principal place of business is to be at this city and lines are to be built in all directions and into the surrounding country. H. M. Basey, of Delta, is at the head of the new company.

WALKERTON, ONT., CAN.—The Bruce Telephone Company has been formed at this city. It is expected that lines will be built in Teeswater, Culross, Brant, Walkerton and other places.

FRANCHISES.

NERSTRAND, MINN.—The Northfield Telephone Company of Northfield has been granted a franchise to construct and operate a telephone system in Nerstrand.

MASSENA, N. Y.—The Home Telephone Company of Malone is endeavoring to secure a franchise at Massena.

MIDDLETOWN, O.—Application has been made to the Middletown council by W. S. Harlan and others for a franchise to build and operate an Independent telephone system in Middletown. It is the intention of Mr. Harlan and his associates to form a new company and form connections with the Hamilton Home Telephone Company and other Independent lines.

HOLLIDAYSBURG, PA.—The right of way to build a line from Hollidaysburg to Williamsburg has been secured by the United Telephone Company.

RENOVO, PA.—The Union Telephone Company has been granted a franchise to establish a telephone system in this city.

HOUSTON, TEXAS.—After considerable opposition on the part of the Bell company, Messrs. Fred. Reed and John Slusher have secured an Independent telephone franchise in Houston.

PINCHER CREEK, ALB., CAN.—The council of Pincher Creek has granted J. E. Woods a ten-year franchise, stipulating that the town is to have the privilege of buying the telephone plant at the expiration of the time or of extending the franchise for another ten years.

FINANCIAL.

SIOUX CITY, IA.—The New State Telephone Company, Sioux City, Ia., on April 1 paid the semi-annual interest on its bonds, and on May 1 paid semi-annual dividends upon its preferred stock at the rate of 7 per cent.

SALISBURY, MD.—At the annual meeting of the Cecil Farmers' Telephone Company a 5 per cent. dividend was declared. The affairs of the company are in a flourishing condition, and it is its intention to extend its operations.

ALLEGAN, MICH.—A 2 per cent. quarterly dividend has been paid by the Citizens' Telephone Company.

LINCOLN, NEB.—The Lincoln Telephone Company has increased its capital stock from $100,000 to $200,000.

BEREA, OHIO.—The capital stock of the Citizens' Telephone Company, of Berea, has been increased from $50,000 to $65,000.

DELAWARE, O.—The capital stock of Delaware County Telephone Company has been increased from $10,000 to $20,000.

MIDDLETOWN SPRINGS, VT.—A 6 per cent. dividend has been declared by the Rutland County Telephone & Telegraph Company.

COMBINATIONS.

DUSHORE, PA.—A merger has been effected between the Wyoming and Sullivan County Telephone Company and the Commonwealth Company of Wyoming Valley. The lines owned by the Wyoming and Sullivan Company extend from Lopez to Dushore, thence through Colley to Wyoming county.

NEW WILMINGTON, PA.—Robert J. Totten, of New Wilmington, has acquired the entire capital stock of the New Wilmington Telephone Company, the purchase price being $4,000. Mr. Totten is secretary of the Plaingrove Independent Telephone Company, and it is quite likely a consolidation will soon be effected between the two systems.

NEWS—WANTED

THE matter contained upon the message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

THE WEEK'S MESSAGES

DAYTON, VA.—The Rockingham Mutual Telephone Company has acquired the plant of the Dayton & Bridgewater Telephone Company.

ELECTIONS.

BELVIDERE, ILL.—The following directors have been elected by the Belvidere Telephone Company: J. R. Balliet, W. M. Marean, F. S. Rowan, Geo. Grummon, M. C. Marean.

SALISBURY, MD.—The Cecil Farmers' Telephone Company has elected the following officers: E. A. Gillespie, president; E. T. Dorcus, treasurer; C. E. Ewing, secretary. Directors—Joseph T. Grove, Elwood Balderston, C. E. Ewing, E. A. Gillespie and J. I. France.

CONSTANCE, MINN.—The Mutual Telephone Company has elected the following officers: President, William Nelson; secretary, J. A. Peterson; treasurer, P. J. Johnson; general manager, John Simonson. The directors are John Simonson, Charles Heglund, Gust Soderburg.

STET, MO.—The following directors have been elected by the Stet-Rockingham & Norborne Telephone Company: J. H. Shirky, Isaac Paul, W. T. Gardner, J. C. Bales, A. Hilton, T. D. White, Philip Shultz, John Rhoades and Otto Keltner.

BOUND BROOK, N. J.—The following officers have been elected by the Somerset County Telephone Company: President, Spencer Weart; vice president, M. M. Hoose; secretary and treasurer, W. W. Smalley.

SALUDA, S. C.—The officers of the newly organized Saluda Telephone Company are W. L. Daniel, president, and T. L. Edwards, secretary and treasurer.

MILWAUKEE, WIS.—The following officers and directors have been elected by the Milwaukee Independent Telephone Company: President, H. D. Critchfield; vice-president, E. A. Wadhams; vice-president, J. S. Van Nortwick; secretary, C. J. Chapin; treasurer, Howard Greene. Directors—John M. Baer, W. W. Cargill, C. J. Chapin, H. D. Critchfield, Howard Greene, J. C. Harper, B. G. Hubbell, George P. Mayer, Wilmer Sieg, Richard Valentine, J. S. Van Nortwick, E. A. Wadhams, Richard Wagner and J. B. Whitnall.

PERSONAL.

P. J. FROST, formerly connected with the Massillon Telephone Company, Massillon, O., has recently been appointed superintendent of construction of the Cass County Home Telephone Company, Dowagiac, Mich.

CLAUDE O. WILHELM, well known to Independent telephone men in Northern Indiana, has accepted a position as chief engineer of the Cass County Home Telephone Company, of Dowagiac, Mich.

MISCELLANEOUS.

FREMONT, IOWA.—The plant of the Farmers' and Traders' Telephone Company, of Fremont, has been purchased by G. S. Terrell from its former owner, W. E. Jenison. The purchase price was $5,000, and the system includes fifty miles of lines and four switchboards, one at Fremont, Cedar, Wright and White Oak.

PULLMAN, MICH.—The Pullman, Mich., Telephone Company, formerly owned by John Pollard, of Elkhart, and M. A. Olds, has become the property of the farmers of Pullman. A mutual company is being organized by them, and the stock is being rapidly sold. The purchase price was $3,000, and among those largely interested in the enterprise are Harvey Cook, John Stevens and Charles Lyons.

OREGON CITY, ORE.—The Clear Creek Mutual Telephone Company has acquired the Bonney line through Parkplace.

New Construction in the Field

TOMBSTONE, ARIZ.—It is the intention of the Tombstone Telephone Company to build lines to Pearce and Gleason, and work has already been commenced.

LESLIE, ARK.—A line between Leslie and Marshall is being constructed by the Farmers' Telephone Company.

CLAREMONT, CAL.—A new exchange is being installed at this city by the Home Telephone Company.

IMPERIAL, CAL.—Many improvements in its system are contemplated by the Imperial Telephone Company, among which is the installation of an exchange at El Centro.

CAPRON, ILL.—The lines of the Capron Home Telephone Company are being extended.

HARTFORD CITY, IND.—Among the improvements planned by the United Telephone Company are the repairing of its lines in Hartford City, and the building of a number of farmers' lines.

GRAND MOUND, IA.—New lines are to be erected by the Farmers' Telephone Company.

LE MARS, IA.—Considerable construction work is being done by the Plymouth County Telephone Company to take care of its increasing business.

RINGSTED, IA.—It is the intention of the Farmers' Mutual Telephone Company to construct three new lines, one northeast and one southeast of the town, and one to Hoprig.

SIOUX CITY, IA.—The New State Telephone Company, Sioux City, Ia., which operates Independent long distance lines centering in Sioux City, and has its own direct circuits to South Omaha, Council Bluffs, Sioux Falls and other intervening points, announces through its secretary, C. H. Smith, that during the year 1907 it expects to spend in the neighborhood of $250,000 in extensions.

PRESQUE ISLE, ME.—The Independent Telephone Company, in which a number of prominent men in Houlton are interested, expects soon to commence the installation of its plant at Presque Isle.

COMFREY, MINN.—A number of new lines are to be erected by the Comfrey Rural Telephone Company, one of which will run through Mulligan Township.

NELSON, MINN.—Among the extensions planned by the Nelson Telephone Company are lines to Osakis, Carlos and Hudson. In all about sixty miles of metallic lines are to be built this summer.

STET, MO.—It is the intention of the Stet-Rockingham Norborne Telephone Company to build a new exchange building in Prairie Township and consolidate the switchboards at Stet, Rockingham and Norborne under one management.

ORD, NEB.—A new switchboard has been installed by the Farmers' Mutual Telephone Company, and many other improvements in its system are planned.

PAPILLION, NEB.—A telephone system is being installed by the Farmers' Mutual Telephone Company in this city.

ELMIRA, N. Y.—Many improvements in its system are being made by the Overland Telephone Company in this city.

LYONS, N. Y.—The Wayne County Telephone Company is considering the advisability of enlarging its plant.

PENN, N. D.—The Penn Rural Telephone Company, recently organized, has commenced the construction of its system.

PORTSMOUTH, O.—A new switchboard is to be installed by the Portsmouth Telephone Company at its branch exchange at Wheelersburg.

WARREN, O.—It is the intention of the Warren and Niles Telephone Company to expend $4,500 in the improvement of its system.

COLDWATER, OKLA.—The lines of the Rural Telephone Company are to be extended from Coldwater to Nashville.

BENTON, PA.—New lines are to be erected by the Benton Rural Telephone Company to Red Rock, Derrs, Emmons, Fritz Hill and Jamison City. The company already operates in Benton township, Jackson township, Sugarloaf township, Fishing Creek township, Stillwater and Millville boroughs, and Greenwood and Fairmount townships.

FAIRMONT, W. VA.—The Consolidated Telephone Company contemplates the expenditure of $20,000 on its Fairmont plant and about $10,000 on its Grafton plant. Long distance service is now complete to Pittsburgh, and a short line to Wheeling is to be opened shortly.

UNDERGROUND.

KEOKUK, IA.—The Mississippi Valley Telephone Company is at work on its underground system.

MANCHESTER, IA.—It is the intention of the Delaware County Telephone Company to place its wires in conduits in the business portion of Manchester.

SIOUX CITY, IA.—The Sioux City Telephone Company is planning to lay $15,000 worth of new cable.

JACKSON, MISS.—The Independent Telephone Company, which is to establish a system in Jackson, expects to place its wires in conduits in the business portion of the city.

HORNELLSVILLE, N. Y.—The Hornellsville Telephone Company expects to soon commence its conduit work in this city.

MT. VERNON, O.—The Mt. Vernon Telephone Company is placing its cables in conduits.

TROY, OHIO.—The Home Telephone Company contemplates placing its wires in conduits in Troy.

OREGON CITY, ORE.—The Home Telephone Company has commenced the work of placing its wires underground in this city.

WAYNESBURG, PA.—It is the intention of the Greene County Telephone Company to place some of its wires underground in Waynesburg.

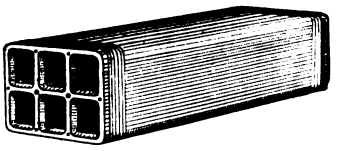
"MORE FAILURES in advertising are made because too little space is used than because too much is used when the right magazine has been selected. Too many beginners in advertising want to use space in everything and so do not begin because they cannot buy as much space as they ought to have in everything, and they do not realize that to use adequate space in the best publication of its kind will give them the most complete knowledge of their advertising possibilities on the least cost without duplication and will make SUCCESSFUL ADVERTISERS OF THEM BY ITS USE ALONE."



WE KNOW HOW
to make conduits, because we have had thirty-five years' experience and employ the most approved methods. The buyer of our conduits can depend upon their being as good as can be made—every one of them. All thoroughly vitrified by our own process.

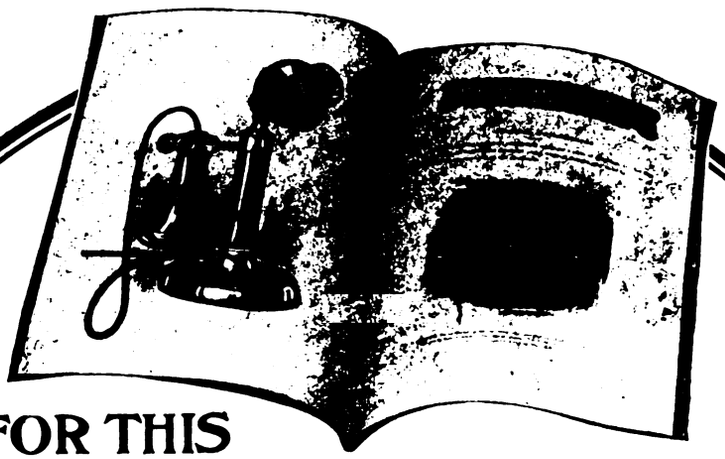
DEAN TELEPHONE APPARATUS



SEND FOR THIS FREE DEAN BULLETIN

Dean Bulletin No. 104B on magneto equipment has just been received from the press. This bulletin is practically a telephone text book printed on heavy book paper containing one hundred sixteen 8x10 in. pages.

It is the most complete bulletin yet issued, showing diagrams of circuits and describing in detail our Magneto Type Switchboards and exchange systems.

Interesting and instructive reading explains the new Dean System of HARMONIC SELECTIVE RINGING ON PARTY LINES USED IN CONNECTION WITH SMALL MAGNETO EXCHANGES.

Useful information on switchboard installing, and maintenance work, is gone into thoroughly.

We will cheerfully mail a copy of this bulletin (No. 104B) free to you. Write us enclosing business card or request on your company stationery.

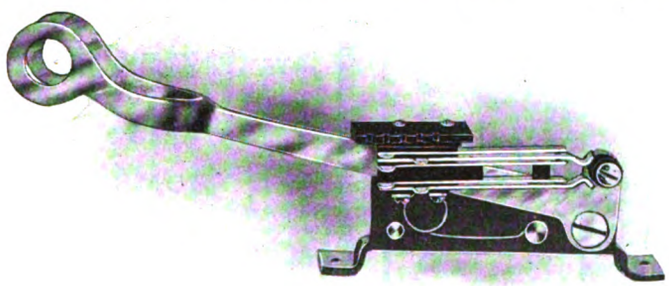
"STROMBERG-CARLSON"

COMPACT TYPE AND "CENTRAL ENERGY" STYLE

BRIDGING TELEPHONES

ARE EQUIPPED WITH

THE "STROMBERG-CARLSON" HOOKSWITCH



NO. 5 HOOKSWITCH.

Its superior points of merit are—simplicity—good mechanical construction—positiveness in action.

Simplicity in design requiring the least number of parts accurately made and correctly designed.

Mechanical Construction is strong and only the best metals and insulation used. The hook lever and contact springs are mounted on the same frame and cannot get out of adjustment.

Contact springs are rigidly supported and thoroughly insulated. There are no "floating contacts" springs adjusted by hand to meet the plunger or hook lever. Platinum point contacts used only.

Action is positive always. The contact springs are actuated by a rubber plunger coming between them. The contact springs are heavy and well formed, insuring maximum pressure on contacts—the motion of the hook lever is always the same, maintaining positive distance of opening between contact points.

Made in several styles for different forms of telephones.

"Stromberg-Carlson" Bridging Telephones give the best and most efficient service.

Write either office for prices to-day.

CENTURY
100% GOOD

The Williams-Abbott Electric Co.

Cleveland, O., April 10, 1907

TO THE TRADE:

We have sold to the Century Telephone Construction Company of Buffalo, N. Y., our entire plant, including our machines, tools, dies, patterns, etc.

This transfer includes all the valuable improvements developed on Williams-Abbott apparatus during our ten years active connection with the telephone business, during which time, our patrons will agree with us, we have built up a line of apparatus that has an enviable reputation.

We have sold the Century Company our materials, manufactured and unmanufactured, our patents, and the good will of the business. Our patrons can thus get a complete variety of apparatus, both common battery and magneto, and it will be to your interest to deal with one concern.

All orders for repairs and renewals, as well as for additional apparatus of the Williams-Abbott make, should be sent to The Century Telephone Construction Company at Buffalo.

While our factory here in Cleveland was a large one, the new factories of the Century Company at Buffalo are three times as large, and our old patrons will be promptly supplied with the same apparatus as formerly whenever they specify it, as the entire line will continue to be manufactured the same as formerly, and under the same factory foremen, who have moved to Buffalo.

Mr. Wright, who was our sales manager, is now a part of the Century sales organization, and we know that any orders for Williams-Abbott materials will have his personal attention and that they will treat you right.

We thank the trade for the patronage that they have favored us with during the past several years, and which has been the basis for the large business we have carried on.

Yours truly,

THE WILLIAMS-ABBOTT ELECTRIC CO.

L. SANDS, President

Hercules Anchor

(PATENTED)

The Iron Dead Man

Made in five sizes, from that for 20-foot pole to large one for extremely heavy strains, wrecking trains, etc.

They are the best anchor in every way for holding up heavy leads and round corners. Easy to set, pull against solid earth and will not creep.

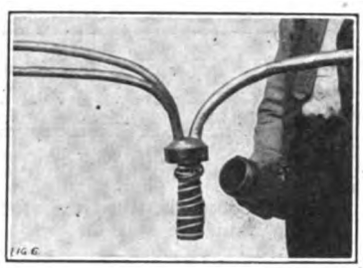
As they are made of Malleable Iron, they are practically indestructible. All anchor plates guaranteed.

Send for descriptive circulars and prices.

Manufactured by

THE W. G. NAGEL ELECTRIC CO.

26-30 ST. CLAIR ST., TOLEDO, O.



TROUBLE!!

When you have found that the trouble in your telephone cable is in a certain joint, it is not necessary to blow the joint or cut the sleeve when you use HARGIS CABLE SPLICING JOINTS. Just take your pair of spanners, unscrew the pot from the ring, unlace the pairs and spread them out like a fan. You can then test the pairs with greater ease than you can with a horizontal wiped joint, on account of the ease in getting at the inside pairs. You don't have to go all over the work again of soldering a seam in your sleeve and wiping the ends of a joint when the repair is made; just screw the pot on the ring and tighten with spanners and you have a perfect joint.

Absolutely moisture proof. Made in three sizes. Costs less on first installation. Saves money while in use. Send in your order to-day.

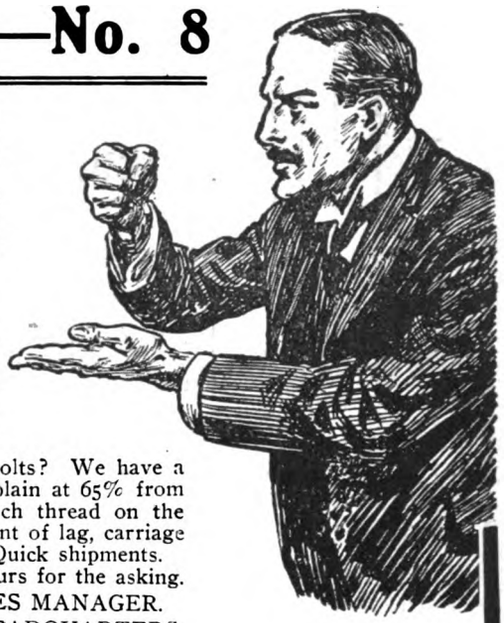
Talks With The Buyer—No. 8



Of course I like to know that the trouble man or the operators are reading these "Talks," but I am not talking to them. I am talking to the man who stands between the stockholders and the dividend, who has to make the dollars go as far as possible.

I want to put ginger into these talks, but I don't want to be funny. This buying is serious business, isn't it? No business man ever lost money by digging up facts and getting at figures. You can't know too much along this line. That's why I put prices in these ads.

TWO GOOD THINGS FOR YOU

One—We have many thousand feet of 25 pair, No. 22, .12 capacity, 5-64 inch sheath on reels of 750, 1,000, 1,500, 1,750 and 2,000 feet. Price less than 1,500 feet, 12½ cents a foot; larger quantities 11½ cents a foot. Also a lot of 100 pair same specification except 3-32 inch sheath, 600, 800, 1,000, 1,250, 1,500 feet reels, 36 cents per foot lots 1,500 feet and over. From stock, f. o. b. St. Louis. The best cable made to-day, new stock.

Two—Are you not usually held up on delivery of large size machine bolts? We have a big stock and quote ½ inch by 9 inch to 18 inch lots of 1,500 and over, plain at 65% from list. Galv. $1.50 per 100 pounds additional. No extra charge for 3 inch thread on the 9 inch size, usual charge on other sizes for extra threading. Any assortment of lag, carriage and machine bolts, large or small, entitles you to this quantity discount. Quick shipments.

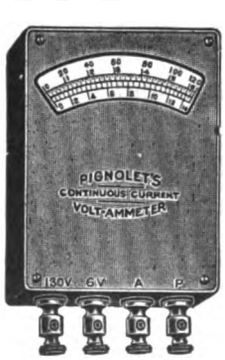
Now frankly can you beat these prices? They are only two of many, yours for the asking. Send your orders now.

THE SALES MANAGER.

MAKE ROOM 616 AUDITORIUM, JUNE NAT'L CONVENTION HEADQUARTERS.

Central Tel. & Electric Co. Makers of High Grade Apparatus. Dealers in Telephone Supplies **St. Louis and Dallas, U. S. A.**

TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit

78 CORTLANDT ST., N. Y.

Do you want the best wire to be obtained for Telephone Service?

Use Roebling Hard Drawn Copper Wire

Do you want a cheaper wire which will last for years and give good service on lines of ordinary length?

Use Roebling Double Galvanized Telephone Wire

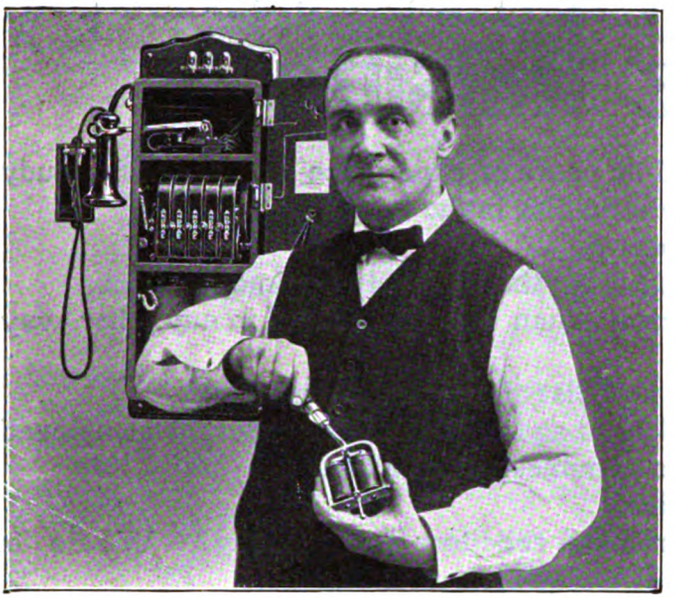
ANDRAE



No Trick at All.

Talks With the Trouble Man

Of all the luxuriant bunches of worry that spring up in the thorny path of the "trouble man," poor ringers furnish both ends and the middle.

I spent so much time and so many livery bills chasing up troubles of this kind that I about made up my mind such a thing as a good ringer would never happen.

When I first saw the ringer with the horseshoe magnet I placed all my bets on it for a sign of good luck. I knew that a ringer without a strong, permanent magnet was like a concert singer with a cracked voice—only good on paper. I knew that the strongest permanent magnets ever made were in the horseshoe form; then, when I looked at the easy, single screw adjustment and tested up the carefully balanced and well insulated coils, I knew that this "Andrae" Ringer was a winner. Since then it has taken premiums all over the United States. If you want a ringer that is *right*, day in and day out, in wet weather or in dry, on good lines or bad, try the "Andrae" horseshoe magnet type. It is like everything else in the special heavy "Giant" Bridging telephone, it is built for business and doesn't need help.

CONDENSERS

If you could see the condenser orders we have been getting since my little talk last month, and the repeat orders found in every mail from those who have tried them before, you would certainly want to get into the band wagon and put your farm lines in up-to-date working condition. One concern bought one thousand (1,000); another, that has been using them for about a year, ran their total up to nearly five hundred (500). There are too many to mention, but they are coming from every corner of the land. When you get condensers on the line, you can ring right by every station that has the receiver off the hook, and the exchange operator can sit back in his chair and laugh at the "rubber necks." We also furnish the regular type of tin case condenser at *prices that are right.* We pay all the expense of a trial, and the sooner you write us the better for you.

PRICES: Patented Type—those that connect outside the telephone.
No. 300.....85c.
No. 301.....90c.

10c. discount in lots of fifty (50); 15c. discount in one hundred (100) lots.

THE WHOLE SECRET

of the success of the AUTOMATIC TELEPHONE SYSTEM lies in the elimination of the girl operators. It cannot be denied that most of the troubles and much of the expense in the manual system (where operators are used) can be charged to the operators themselves.

TRUE ENOUGH,

all operators are not faulty all the time, but some of them are at all times and all of them are sometimes. But "a chain is no stronger than its weakest link," and the average telephone subscriber judges the entire service by the poorest he has received.

IN THE AUTOMATIC TELEPHONE SYSTEM

the fallible human operator has been displaced by an infallible machine, a machine that produces perfect telephone service. With the human operator disappear her faults and her expense. The former are many, the latter not inconsiderable.

THAT IS WHY

the AUTOMATIC TELEPHONE SYSTEM, having no operators, can produce a perfect telephone service, prompt, accurate, absolutely secret, at a much lower cost than for inferior manual service. That is why it is a profitable investment to put your money into an operating company that uses the Automatic Telephone System. Our Automatic Telephone System has been adopted in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.
Battle Creek, Mich.
Beaver Falls, Pa.
Bellingham, Wash.
Butte, Mont.
Cadillac, Mich.
Champaign, Ill.

Soliciting New Subscribers and Rate Raising

By the use of methods that we have acquired by years of experience and scientific study, we are in a position to overcome many obstacles in the telephone business.
We can develop your exchange to its full capacity.
We can start new companies on a paying basis from the time they begin operations.
Our solicitors secure 100 per cent. better results than can be secured in any other way, and that, too, at a much lower cost.
Rate Raising is our specialty, and we have a long list of satisfied patrons.
Great care is taken in the selection of our solicitors, and only the most expert are employed.
Our prices are reasonable, and are based on a commission or salary.
Our guarantee goes with every man we furnish.
Can you afford to maintain a force of experienced solicitors permanently? We do for your benefit.
We guarantee to place your company on the road to success.
Write for our booklet, and become familiar with our proposition.

CALCULAGRAPH

By reason of errors made by operators timing toll messages telephone companies fail in a large number of cases to receive payment for "excess time on toll service." Practice has shown that the loss of revenue resulting from such errors is equal to from six to fifteen per cent of the total receipts from toll business. On ten thousand Calculagraph records which were tested the average error was *less than four seconds per message.*

The Telephone Wire Plant*—Continued

By S. P. Grace, Chief Engineer C., D. & P. Telephone Co.

THE type of construction employed in interior block distribution is so inconspicuous as to be rarely objectionable, and in consequence its use should be adopted wherever possible. Figs. 7 and 8 show good examples. In certain districts in the neighborhood of underground subways, the buildings may be very old or may be very widely scattered. In these cases an interior block system could not be installed to advantage, and a low ring-top distributing pole should be used pending the time the block will be sufficiently built up to permit of direct connection or interior block wiring. Fig. 9 shows an example of this type of construction. Distributing poles are useful for furnishing connection between the underground system and the subscribers' premises during a period when direct connection or interior block wiring is not warranted. Ultimately, it seems certain that the distributing pole is bound to go.

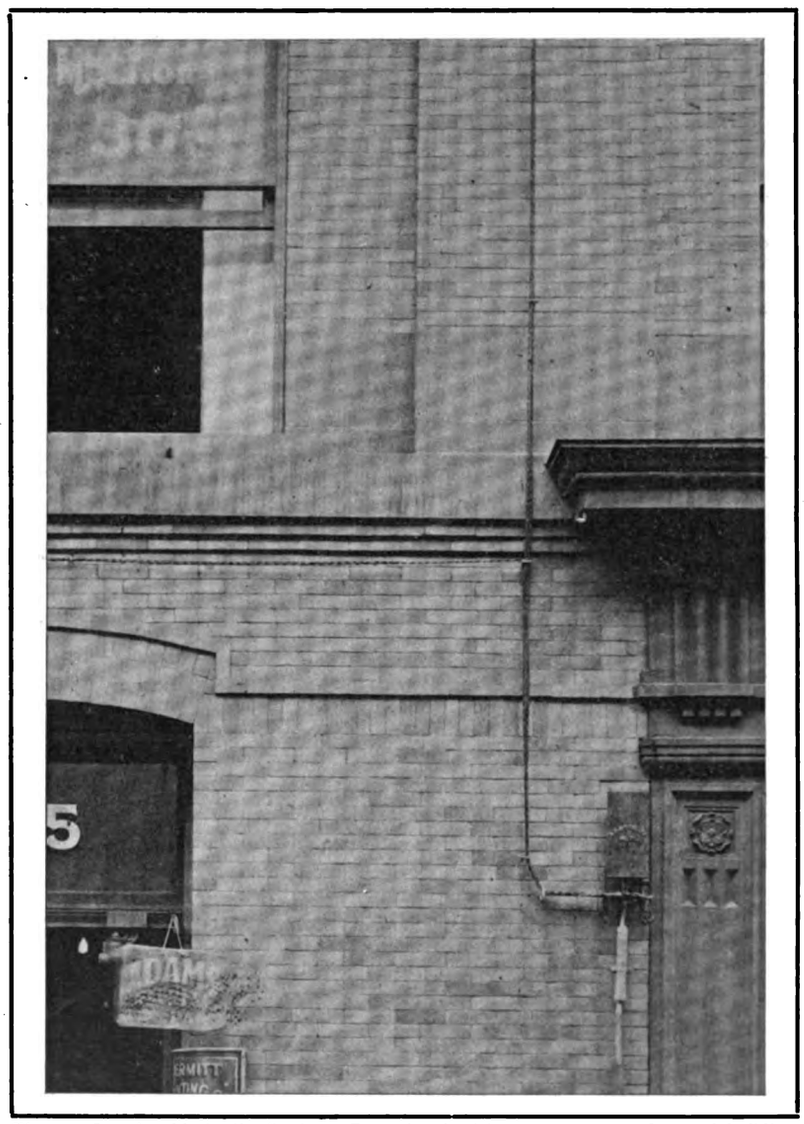

Fig. 7.—Interior block distribution. Example of wiring run to upper floors of building.

A very large proportion of telephone service must be given in scattered residential districts where the number of circuits is so small as not to justify conduit construction. If conduits were installed at once, the construction plant costs would be very materially increased and consequently the cost of service to the subscribers would have to be increased. It is therefore necessary to determine what is the most economical, efficient, and sightly form of aerial distribution. In the early days of the telephone it was but natural that the distribution of the telephone wires should follow the same practice adopted by the telegraph companies. Very soon it was found that the number of telephone wires multiplied very rapidly, which required towering poles, equipped sometimes with as many as twenty cross-arms. The invention of the dry-core lead cable furnished relief for these lines, although for many years it was the custom to use as much open wire and as little cable as possible.

When the great expansion of the telephone began in 1897 it became imperative to design other methods for aerially distributing telephone lines. The system which was finally worked out and decided upon is that known as the aerial cable or all-cable system. In this system, very low poles are used, rarely exceeding 30 to 35 feet in height. These distributing lines are placed in alleys if they are available. A cable is strung near the tops of the poles and on alternate poles are placed 10 or 15-pair terminals. Each pair in the distributing cable appears in from two to four terminals, and common pairs are so laid out in adjacent terminals that it is easy to provide for party lines. The multiplying is so arranged that when the cable becomes crowded it may be cut into two or four parts, all pairs appearing in each part, and relieved by feeder cables. No cross-arms or bare wires are used for distribution along the lead, but from the binding-posts in the cable terminal a twisted pair, rubber-covered, and braided wire is strung directly to a point within the subscriber's premises. The use of this well insulated twisted pair wire very materially reduces the maintenance. An aerial cable system of this kind with twisted pair wires leading directly to

*Abstract from paper presented at the 128th meeting of the American Institute of Electrical Engineers, April 26, 1907.

Digitized by Google

the subscribers' houses is undoubtedly the most sightly form of aerial distribution, since all the cumbersome and troublesome open wires are done away with.

Attention is called to the grooved insulators used for supporting the twist wires illustrated in Figs. 10 and 11. Each wire of the pair occupies a separate groove, thus preventing a crossing of the wires, which sometimes injures the insulation when there is a heavy strain on the wires.

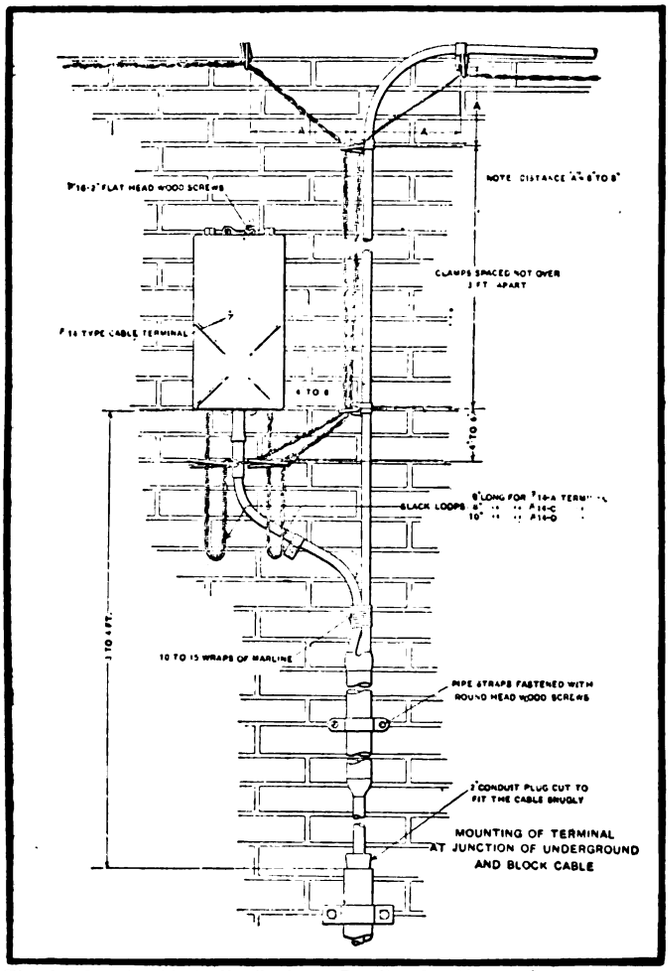

Fig. 8.—Interior block distribution. Details of cable terminal connections on wall of buildings.

There has been considerable discussion among engineers regarding the life of twisted-pair, rubber-covered distributing wire. Rubber and paint are somewhat alike, in that all kinds of mixtures are sold under their names. If the ordinary type of market wire, which is mainly intended for inside wiring, is used, the life will be much shorter. A good quality of rubber distributing wire well protected with a heavy braid should prove serviceable for ten or fifteen years. Samples taken down after having been in use for seven to nine years still show an insulation resistance of 200 to 400 megohms per mile when submerged in water.

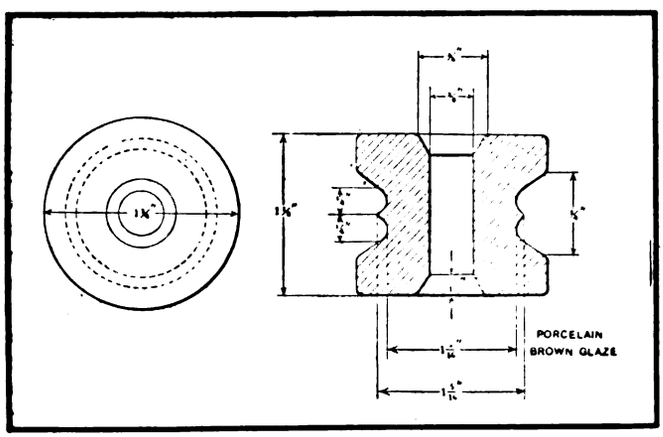

Fig. 10.—Porcelain knob used for attaching twisted pair drop wires to houses.

Until recently the type of distributing wire most generally used was made of No. 14 B. & S. gauge copper. This size of wire was not necessary for conductivity, for as a rule it was connected to a 22 or 19-gauge cable pair. This size of wire was required for mechanical strength, because the wire was strung in spans and had to be self-supporting. During the past year there has been put on the market a copper-clad steel wire which is made by a new method. Copper is welded to a steel ingot and the copper and steel drawn out uniformly together. From all the examinations we have been able to make it seems that there is a perfect union between the copper and the steel. A No. 17 B. & S. gauge copper-clad wire having 30 per cent conductivity of copper has the same tensile strength as a No. 14 B. & S. hard-drawn copper wire. This reduces the amount of material in the distributing wire one-half, and what is still more important, on account of the reduced area, decreases the amount of expensive rubber compound required to surround the wire. The amount of braid covering is also materially reduced. The finished wire is very light and easy to handle and costs approximately 30 per cent less than the No. 14 B. & S. type.

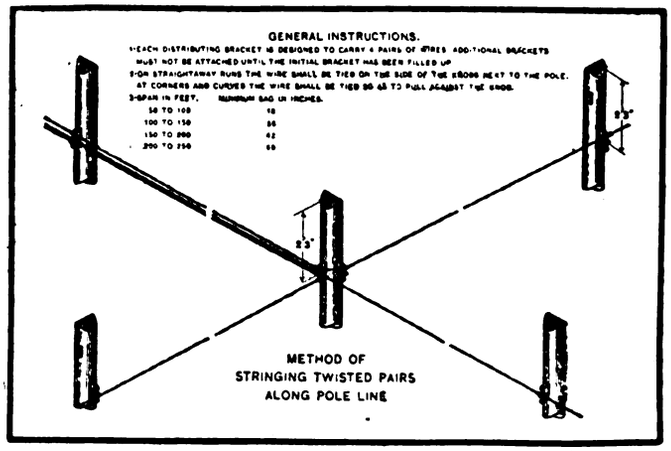

Fig. 12.—Method of stringing twisted pair wires along a pole lead.

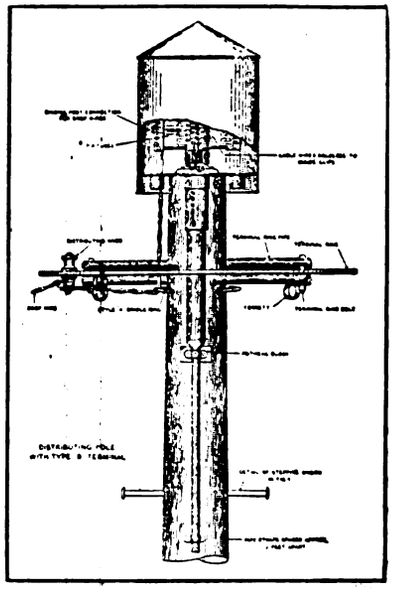

Fig. 9.—Details of circle top distributing pole.

At first sight it seems that a terminal on alternate poles must be expensive, and that terminals farther apart and with intervening distribution made by bare wire, would be cheaper. In order to determine this point clearly, a study was made showing a comparison between aerial cable distribution with taps on alternate poles and with twisted pair direct to the houses, as compared with aerial cable supplemented with bare-wire distribution. Various densities of telephone distribution were assumed, and it was found that in nearly all cases the system with taps on alternate poles was not only cheapest in first cost, but also in annual charges. Where the distribution was very dense it was found that a tap on every pole was the most economical.

ECONOMICAL FINANCING.*

By A. T. Averill, President Cedar Rapids & Marion Telephone Company.

THE economical and successful financing of the modern telephone plant is a matter which should be considered carefully and with a view to the future by all who engage in the business, for in the careful building of the financial foundation on which the superstructure of the business is to stand depends the ultimate success of the enterprise. Without this adequate preliminary financial preparation the chances are strongly against the success of the business, for it is a peculiar fact that the larger the growth of the telephone exchange the greater the cost of maintenance per telephone, bringing with it an ever-increasing demand for capital to carry it along.

Before engaging in the construction of a telephone plant the ground should be examined carefully as to what will be required for present needs in the way of equipment, and in addition to this due consideration must be given to the probable growth of the future. Having determined as accurately as possible the size and cost of the plant which will be required for present service, and also what may be necessary in succeeding years, it is a wise plan to incorporate for at least double the amount, which it is planned to put into the plant at the start. On the organization of the company it is well to distribute the stock as widely as possible among the local investors. Every stockholder is a friend of and an active worker for the company. Each man so interested exerts his influence in its favor.

The fifty per cent. of the stock not sold should be kept in the treasury with the view of being used if required for additions and improvements to the plant as the growth of the business demands.

As an additional means of financing the company, it is well to issue bonds to the amount of about one-half the stock issued, and so far as possible these bonds should be placed with local investors, thus further strengthening the local feeling in favor of the company. These bonds should bear 6 per cent. interest and may be made to run the usual length of time for such securities.

In the construction of the plant none but the best and most approved telephone appliances should be used. In the long run the best is always the cheapest, and with the plant equipped in the modern manner the service which is rendered to patrons of the exchange will be far more satisfactory and free from causes of complaint than if cheaper and a less approved apparatus is installed.

Rates for service should be placed at a figure that will allow the company to operate with net annual earnings of from 15 to 20 per cent. Of this sum the stockholders may be paid semi-annual dividends of 3 per cent., and the balance may be used as a fund from which to pay extraordinary repairs, such as are occasioned by sleet storms and other unfavorable weather conditions and with which every telephone company is called upon to contend. From this fund must also be taken renewal repairs, and it must also carry the item of deterioration, it being a well-known fact that the life of the average telephone plant does not exceed fifteen years.

In this paper it is not the writer's intention to enter into a discussion of details of the management of a company, but so far as this branch of the business relates to the financing of the plant, it may be said that if the labor of the men who organize the business and who make the outlay is to be successful and the stockholders are to have a satisfactory return on their money invested there must be a most careful and practical management on the part of those entrusted with the daily work of the plant. The manager must be a man of ability and one who has a thorough knowledge of every detail of telephone construction and management. He must select his assistants with the view of getting the best service and must hold them to strict account for the conduct of their various departments. In the business office a complete and systematic yet simple system of accounts should be kept from which regular statements, showing the condition of the business and the amount of business transacted, with its receipts and expenditures, may be made. The matter of collecting quarterly rentals should be followed up closely. All telephone rentals should be collected quarterly in advance, and all toll line charges should be collected each month. In short, the auditing department of a telephone company should be conducted along clear-cut, well-defined business lines.

If Independent companies are to make a complete success of their business and hold the field against the encroachments of their competitors they must devote special attention to toll business, extending their toll lines in all directions, making good connections with other exchanges and covering the field so thoroughly that there will be no opportunity for competition. These toll lines should be built in the best and most permanent manner, using copper whenever possible and certainly on all main leads. Every effort should be made by the management to give the public a prompt and satisfactory toll line service, and in this, as in all other matters affecting the common good of the Independent companies they should work harmoniously together.

*Abstract from an address delivered at the convention of the Iowa Independent Telephone Association.

SEMI-ANNUAL STATEMENTS OF FINANCIAL CONDITIONS TO BE REQUIRED OF TELEPHONE COMPANIES IN SOUTH CAROLINA.

RULES requiring telephone companies to make semi-annual statements of their financial condition and other details of their business have been adopted by the Railroad Commission at Columbia, S. C. Formerly the requirement was that the companies should furnish annual statements covering receipts and expenditures as to each exchange, number of telephones in use, wire mileage, etc., but a measure has been proposed recommending having these statements filed every six months. Other rules have been amended so that telephone companies are given thirty days instead of ten in which to file their answers to complaints made against them. Hitherto petitions for a hearing in regard to rates have been received when signed by two or more subscribers; at the present time an amendment to Rule 9 states that such petitions will receive consideration if signed by one or more subscribers.

TELEPHONE BOX NO PLACE FOR A WIFE.

YEARS ago, when telephones were a novelty, a farmer from the outskirts of Manchester, N. H., called on a lawyer friend of his, now United States Senator Henry E. Burnham, residing in the city, says *Southwestern Telephone News.*

"Need any butter this morning?" asked the farmer in the course of the conversation.

"Well, I don't know," answered the lawyer. "Wait a minute. I'll ask my wife about it."

After speaking at the telephone he went on: "My wife says no."

The farmer's face was a study for a moment. Then he broke out with: "Look ahere, Mr. Lawyer, I may be a 'rube' and have my whiskers full of hayseed, but I'm not such a blamed fool as to believe that your wife is in that box."

MICHIGAN INDEPENDENT TELEPHONE MEN PREPARING IMPORTANT STATISTICAL BOOK.

IT is reported that the officials of the Citizens' Telephone Company, of Grand Rapids, Mich., are preparing a hand book of information concerning Independent telephone business in the State of Michigan. It will contain a directory of all Independent companies in the State, statistics of special interest to Independent telephone men, the names of officers and members of the three principal associations of the State and several well chosen articles on the telephone business. A feature of the book will be articles prepared by the president of each of the three associations, the Michigan Independent Managers' Association, the Michigan Independent Telephone Association and the Michigan Telephone Traffic Association. This book will be of interest to all telephone men and of great value to the Independent movement.

Laurel, Miss., Protests Against Poor Service

ABOUT four years ago the Cumberland Telephone and Telegraph Company bought out a private telephone company in Laurel, Miss., and installed a general telephone business, both local and long distance. For the past two years the service it has been giving is reported to have been very unsatisfactory, so much so that there were many complaints from the citizens, and finally the matter was taken up with Hon. T. H. Oden, Mayor of Laurel, and the Board of Aldermen. Through them the officials of the telephone company were notified of the situation and asked to correct it. The trouble which the officials had brought to their attention was stated as follows: The service generally was bad; there were many orders for telephones and none of the orders were being filled by the company. It would take from ten minutes up to get connection with anybody, anywhere, and after one got connection it was very often the case that he did not understand the things that were being said. The operators were generally slow and unconcerned in giving service to subscribers. And finally there was a contract which the people did not desire to sign, and a great many would not sign, which the telephone company demanded that they should sign before it would install an instrument for them.

The Mayor and Board of Aldermen and the Business League of the city have finally got the company to giving fairly good service, and the main trouble seems to be now in connection with the contract that the company requires its subscribers to sign.

The contract is in the following words:

Form 71 A. ....., 190...

To Cumberland Telephone and Telegraph Company:

You are hereby authorized to place a Telephone Instrument and necessary wires and fixtures therefor, on.....service, in my house, No. .....and occupied as..... and for which I agree to pay $.....per month, from time the same is put in working order, and keep the same for one year. I further agree to keep the same thereafter on same terms until this contract is canceled by either party giving thirty days' written notice—and further agree to pay the same promptly at the end of each and every month at the office of the company.

Short Rates: For three months or less, 40 per cent. of the total annual rental; more than three, and less than six months, 75 per cent. of the total annual rental; six months, or more, the total annual rental will be charged without rebate or other reduction.

I agree that service may be discontinued for non-payment of rental whenever the same is past due, and that no rebate will be claimed or allowed for the time of such discontinuance.

There shall be no liability for cessation of service, or failure to furnish continuous service for any cause whatever, unless such cessation continues for forty-eight consecutive hours after written notice, and the only liability for failure to furnish service for a longer period will be a proportionate rebate in the rental.

I also agree to pay monthly for all messages that may be sent from my telephone over the toll lines operated by or in connection with the Cumberland Telephone & Telegraph Company. If any change in location of instrument, or character of service is desired, it will be done at the expense of the undersigned.

Party line numbers are subject to change if necessary.

.....

This contract was thought to be unreasonable and illegal, but the Cumberland Telephone and Telegraph Company absolutely refused to install telephones any more unless the subscribers in Laurel would sign this contract, although the subscribers would tender a month's rent in advance.

A majority of the telephones in Laurel, prior to some time in 1906, had been installed without the subscribers signing this contract, and hence it was thought by the officials and others that to let the old subscribers keep their telephones without signing the contract, even if the contract was legal, would be a discrimination. The Mayor and Board of Aldermen of Laurel submitted this contract to the railroad commissioners of the State for their opinion of the legality of the contract, and to learn if the company could require the contract to be signed by subscribers without installing a telephone, and at the same time force the company to comply with all the requirements of common carriers.

The railroad commissioners, after receiving the contract sent them, and the letter which Mayor Oden wrote them, submitted the matter to the attorney general for his opinion, a copy of which is as follows:

Jackson, Miss., April 25, 1907.

The Mississippi Railroad Commission,
Capitol.

Gentlemen—I am furnished with a copy of a contract which the Cumberland Telephone & Telegraph Company is using or attempting to use at Laurel, Miss., the said company refusing to install telephones unless the prospective subscribers will sign this contract. One clause of the contract is as follows:

"There shall be no liability for cessation of service, or failure to furnish continuous service for any cause whatever, unless such cessation continues for forty-eight consecutive hours after written notice, and the only liability for failure to furnish service for a longer period will be a proportionate rebate in the rental."

I am asked for an opinion as to whether the telephone company may lawfully refuse to furnish service to a citizen who declines to subscribe to this clause, though tendering in advance one month's rental and agreeing to all other stipulations in the contract.

Telephone corporations are for many purposes regarded as common carriers, and especially are they such to the extent that they must serve all alike who apply to them for services which fall within the scope of their business. Whenever they so hold themselves out to the people, they become public servants to be controlled by the public. Whenever they are applied to by anyone to perform a duty which falls within their corporate powers, the same must be done punctually, impartially, and in good faith.

Jones on Telegraph & Telephone Cos., Sect. 38.

It follows that "these companies must not only furnish services and facilities to their subscribers, but they must furnish like services to all, on like terms. They must furnish every person who requests it with a separate telephone and with telephonic communications and connections."

Central U. Tel. Co. vs. Falley, 10 Am. St. Rep., 114.

Now, this clause in the contract above quoted absolves the telephone company from all liability caused by suspension of service, even though the interruption may be due to the negligence of the company and that, too, of the grossest kind. It is well settled in this State that a common carrier cannot enter into a contract which will excuse itself from the consequences of its own negligence.

Johnson vs. Railway Co., 69 Miss., 191.

Railroad Co. vs. Abels, 60 Miss., 1017.

"Telegraph companies are—and that, too, in the absence of a statute—so far common carriers that they cannot exempt themselves from liability for the consequences of their own negligence or that of their servants by a contract made between them and the sender."

Jones on Telegraph & Telephone Cos., Sect. 37, and the long list of authorities there cited.

Of course, the same rule applies to telephone companies. It follows that since the clause quoted in the inquiry is one which the telephone company cannot enforce, it embodies a contract feature which the company has no right to insist upon as a condition precedent to giving service to an applicant who is willing to comply with all the lawful terms of the contract.

Very respectfully,

R. V. Fletcher, Attorney General.

A letter from the Hon. S. D. McNair, president of the railroad commission of Mississippi, addressed to the Mayor of Laurel, is as follows:

Jackson, Miss., April 26, 1907.

Hon. T. H. Oden, Mayor,
Laurel, Miss.

My Dear Sir—I beg pardon for the long delay in replying to your letter of the 17th, which was caused principally by my absence, and the further fact that I was waiting for an official opinion from the Attorney General, a copy of which I herewith enclose.

I am glad to say that his opinion coincides with yours, and is the position that I have taken all along.

As to the other matters complained of, we will handle them all promptly. The Cumberland Co. has certainly given your people trouble enough, and we will have things straightened out.

The opinion of Gen. Fletcher covers the whole ground, and I would like for you to let me know what steps, if any, your Council will take in the matter. Yours very truly,

S. D. McNair, President.

The vigorous action of the Mayor and his associates seems to have brought about the settlement of a question of much importance to the telephone users in his State.

Independent Long Distance*

By E. E. England.

SO far as we can learn the building of Independent toll lines began soon after the birth of the Independent movement When the butcher, either with or without the financial aid of his fellow townsmen, began to operate his little exchange he soon came to realize that there was a growing demand among his patrons for a connection with the patrons of his friend the baker, who had been obliged to also build an exchange. He and his friend therefore decided to build a connecting line, grounded of course, between the two exchanges to meet this demand. Neither one had a thought, at this time, that he should receive any remuneration for this additional service, other than what had been previously charged for the use of the one exchange. This did very nicely for a time, but soon the patrons of each exchange began to make complaint that it was almost impossible to get service over this line as it was so frequently reported "busy." Soon the line needed some repairs and then it began to dawn upon these gentlemen that they were paying out good hard-earned dollars for something for which they were receiving absolutely nothing in return. They thereupon agreed that the grounded line should remain as it was for the free business, but they would build another line, which should be metallic, between the two exchanges, making a reasonable charge for service over the new line. Thus began Independent long distance service.

For a time after this movement began these toll lines were largely confined to counties, the various exchanges desiring to be connected with the exchange in the county seat or other large town of the county. Gradually, however, these lines were extended to cover groups of counties, and in some instances an entire State. This is the condition in which we find many of the Independent districts to-day, while in others long distance companies have been organized to build and operate the long distance lines.

Many of our Independent companies fail to realize the importance of good long distance service. It is true, when the Independent movement first began, and the telephone was considered a luxury even by well-to-do people, there was but little demand for real long distance service. That day has passed. People of very moderate resources no longer consider the telephone a luxury but rather an absolute necessity.

The government has been increasing its facilities for the rapid handling of the mails, the Western Union and Postal Telegraph companies have been extending their lines, and yet the people are demanding better and more rapid means of communication. This condition was foreseen by the Bell company and when forced to the conclusion that the Independents were here to stay they at once began the systematic development of their long distance lines.

That the Bell company does not have circuits enough to at all times handle even its own business is a fact well known by any one who has even occasionally used its toll lines. If with but 38,836 feeders, or branches, in Iowa, to draw from it finds its trunk lines so congested with business that at times it is forced to keep patrons waiting an unreasonable length of time, it will require no skilled mathematician to deduce the fact that, with 184,689 subscribers on December 31, 1905, with the tremendous increase in the number of telephones since that date and with Omaha and Council Bluffs on the west and Chicago on the east just opening or opened to the Independents, it will be quite a while before one need fear an over development of Independent long distance lines in Iowa. With San Francisco, Portland, Tacoma, Denver, Omaha, Chicago, Detroit, Milwaukee and now staid old Boston safely captured by the Independents there will be a greater demand than ever for Independent long distance service.

The question now before us is how may we secure these necessary lines to handle the business?. Who shall build and operate these long distance lines? Shall it be the local company or shall it be a separate long distance company? Perhaps there may be a difference of opinion concerning these latter questions, some holding to the one opinion and others to the opposite. The writer believes a long distance company could do the work in a more satisfactory manner and will cite one instance in support of this opinion.

In a certain commercial center is an Independent telephone company having a good local exchange and owning and operating some iron toll lines. The neighboring Independent companies have been trying for more than two years to get in and through this city with copper circuits. Without calling in question the business judgment of this company or its manager, the fact remains that there has for some time been a No. 10 copper circuit 12 or 15 miles from this city upon each side, but that gap remains unclosed to this day. No difficulty of this kind would be encountered if a long distance company were building through that territory. It may be best in one section for the local exchanges to unite and build their own long distance lines while in another section it would be more satisfactory to all concerned to have an Independent long distance company build them. Whichever plan is adopted let those interested not lose sight of the fact that for satisfactory service it is absolutely necessary that these lines be built in accordance with modern specifications. As to securing the necessary lines to handle the business, whether these lines are built by the local exchanges or by a separate company, there must be something to convince the prospective investor that the money he contemplates investing in Independent long distance lines will be safe, and that certain and reasonable dividends can be paid. Is it possible to do this while each exchange goes on the principle, "Get what you can and can what you get"? It certainly is not.

Upon this certainty the Iowa Clearing House is founded. The aim and purpose of the Clearing House is to so divide the money received from the use of the toll and long distance lines that the owner of each mile of line over which the message has passed will receive his just proportion of the fee derived therefrom. This is the only fair and equitable method of division, and the only method under which one can ever hope to secure proper development of the Independent long distance lines in Iowa or elsewhere. It may be that on account of local conditions some are or have been receiving under the plan of keeping all toll fees collected, more than they would under a fair division, but they would be very short-sighted indeed if this were permitted to stand in the way of progress. Under Clearing House methods these much desired long distance lines will not be long in building and the fees from the long distance calls which are now sent to the monopoly will come into the Independent treasuries.

One of our friends wants to strike out of the English language, without the sanction of the "powers that be," the old and honored word "toll" and use only long distance. His reason he states as follows: "We are finding in this locality that our opponent hopes to fix the idea in the minds of the public that it is *the* 'long distance' system, and the only one. The result would be that when one was asked to call another on the long distance line the call would unconsciously be understood to mean 'monopoly' service, in spite of the fact that the one speaking had in mind the Independent system."

This is something that should not be permitted to continue. Independent companies should by judicious advertising, in directories, in newspapers and by other approved methods, inform the public of the service they are prepared to furnish and so educate them that when desiring long distance service they will naturally and always "Look for the Shield."

* Abstract from an address before the members of the Iowa Independent Telephone Association at the annual convention.

Flat Rates *vs.* Measured Service—Continued

While Preparing a Report on Telephone Conditions in Chicago, Under Instructions from the City Council, the Special Committee of Telephone Experts, Messrs. Jackson, Crumb and Wilder, Had Exceptional Opportunities for Studying the Effect of Measured and Flat Rate Systems of Charging on the Cost and Efficiency of Telephone Service. What They Have Found, and the Conclusions They Draw, Constitute a Document of Great Value and Importance. The Following is an Abstract from the Part of Their Report Dealing With This Subject.

A RECORD of observations made for the purpose of learning the relation between the number of times a line is used in an hour and the number of times a line is reported busy during the hour is shown in Chart No. 11. By the phrase, the number of times a line is used in an hour, we mean the number of actual messages, outgoing and incoming, which pass over the line in the hour. Chart No. 11 is plotted from data collected by the Chicago Telephone Company through a special observer, who

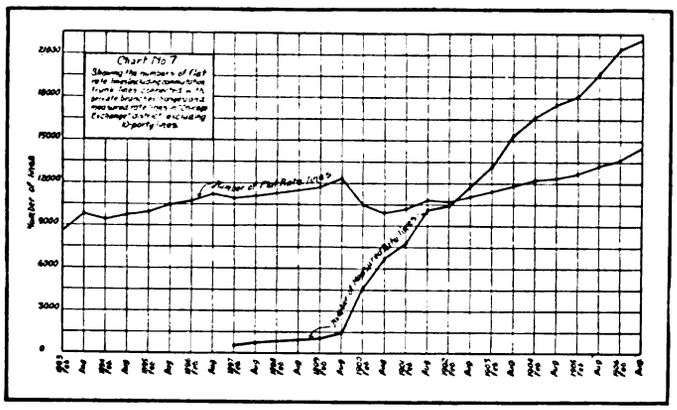

Chart No. 7.

kept up a series of careful observations on several hundred lines. The data observed have been plotted, using the number of messages passing over the line, that is, the number of times the line was used in an hour on the horizontal axis and the number of times during the hour the line was reported busy on the vertical axis. Each circle laid down on the plat represents the averages of a number of observations as shown in the table accompanying this chart and the observations represent data derived from numerous lines, so that the points may be assumed to be fairly accurate in representing the facts. The circles represent the average data obtained and we have drawn a curved line to represent the average of the positions of the circles. It will be observed from this curve on the chart that if a line is used eleven times an hour it may be expected to be reported busy at least twice during the hour to calling subscribers who desire to communicate with that line; but if it is used twenty-one times an hour it may be expected to be reported busy not less than ten times. This plainly shows that *the unavailing calls increase in a tremendous ratio as the load on a telephone line increases.*

Our chart No. 11 is based upon the number of times a line is used in an hour, but we will point out here that almost all lines that are used in flat rate service are very much busier during one hour of the day than during any other hour of the day; that is, a large proportion of the total calls over a telephone line during a day are made within certain specific "busy" hours, which makes the busy reports much more numerous during certain parts of the day than the average number of calls might indicate.

Chart No. 6 shows the growth since August, 1901, of the different classes of service in the Chicago exchange district (that is, excluding the neighborhood exchange telephones). It will be observed that during this period ten-party line telephones, which are nickel prepayment telephones, and therefore belong in the measured rate class, and the other measured rate telephones, have increased steadily. The private branch exchange telephones have also increased, and a considerable portion of these also belong in the measured rate classification. The flat rate business and residence telephones have not increased in a large degree. We were not able to obtain the actual data for the two preceding years, but the measured rate service was proportionately increasing during those years, it having been first introduced about 1899; and our chart No. 5 shows that during these years' increase of the measured rate service, from 1899 to 1906, the average number of calls per telephone per day has consistently decreased. This has helped to make it possible for the Chicago Telephone Company to steadily decrease the average charges per telephone within the Chicago exchange district. That such a decrease has occurred is plainly to be observed from our chart No. 12, which shows two curves, one indicating the average number of telephones in use in Chicago during each year from 1897 to 1906, which is indicated by a rising line from left to right as the dates advance, and another curve showing the average rate paid per telephone during the year, which is indicated by the falling line as the dates advance. The average rate paid in 1897 was $123.53, as indicated on the chart, and it has fallen year by year since until it has now become as low as $53.29. The figures on this chart do not include "neighborhood" telephones.

With continued careful management, improved methods of keeping records for the determination of the costs of the different classes of service, and a greater extension of the measured rate service, we believe that the Chicago Telephone Company, in case it should be granted a franchise, can continue this decrease in the average yearly rate that the subscribers may pay per telephone, until the average yearly rate does not exceed forty dollars, or perhaps less, and a large proportion of the telephones will be paying not more than eighteen dollars per year. On the other hand, our study of the problem convinces us that an extension of the flat rate telephone service would tend to so greatly increase the useless calls over the telephones, and so overload the lines, that the unavailing calls would in-

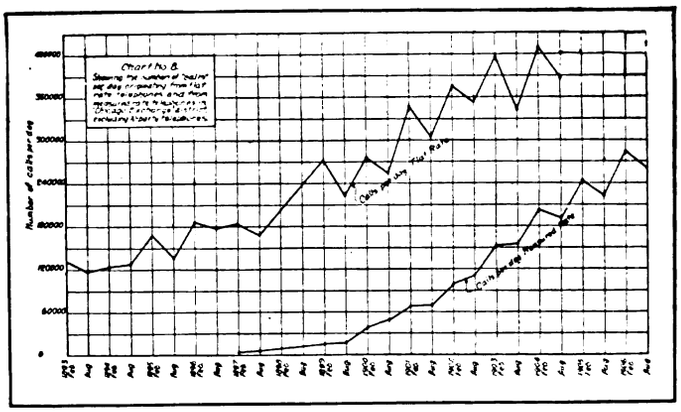

Chart No. 8.

crease tremendously, making the daily calls per telephone even larger than they were in 1896, and thus increase the annual expense of the service so largely that the average price per telephone would be given a tendency to rise instead of fall.

It is a tradition in telephone circles that the service per tele-

Digitized by Google

phone costs more as the number of telephones connected with the plant increases. As the number of telephones increases, each

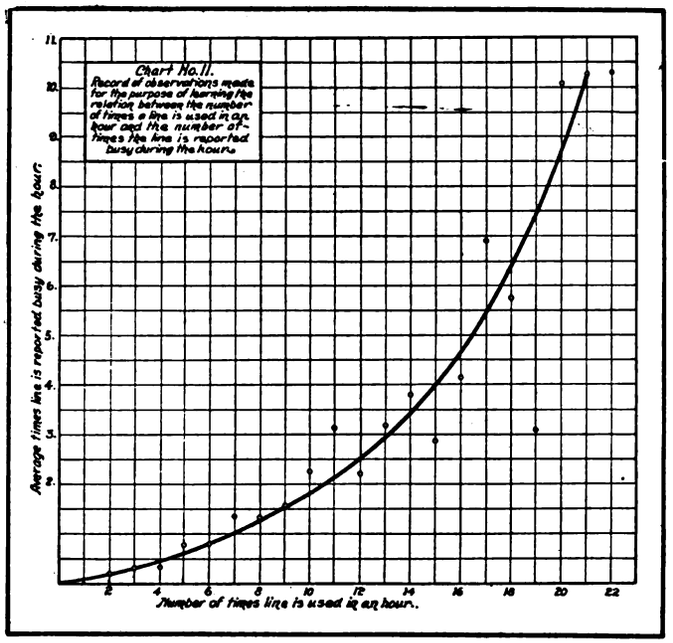

Chart No. 11.

subscriber has the opportunity to call upon more people by telephone, and the law of averages would indicate that the number of calls per day from each telephone should increase, thus making the service more expensive to the operating company, provided the service is flat rate service and unnecessary use of the telephone is not deterred by a measured rate charge. This condition seems to have worked out in practice, according to the statements of telephone companies at Cleveland, Indianapolis and elsewhere, and flat rate service seems to increase in cost per telephone as the number of telephones attached to a system increases.

On the other hand, a different condition exists in connection with measured rate service. With the measured rate service the message is the unit instead of the rental of the instrument; and it is the message that the subscriber ought to pay for, because it is for the purpose of sending his messages that he provides himself with a telephone. With measured rate service, and a reasonable use of the telephone lines, the unavailing calls are reduced to a minimum. The number of calls per telephone per day, apparently, are not inclined to increase as the system increases in extent. This is illustrated in our charts Nos. 9 and 10. But the total number of messages handled increases

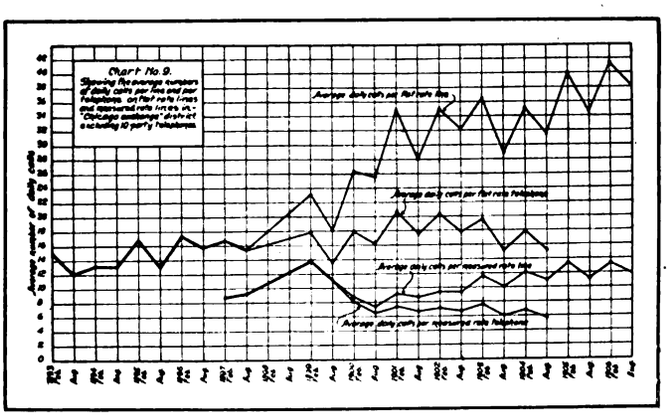

Chart No. 9.

approximately in proportion to the number of telephones. Under these conditions, the ordinary laws regulating the difference between the cost of producing articles in large and small quantities comes into play, and the actual cost per message ought to steadily decrease. Since it is the messages that are paid for under the measured rate system and the actual cost per message ought to steadily decrease as the system enlarges, the average amount paid by each subscriber will decrease if the subscribers limit the use of their telephones to their actual needs, and the telephone company is well managed.

The difference thus arising between flat rates and measured rates is very marked. The flat rate telephone user tends to increase his number of messages as the system enlarges, so that the average calls per day per telephone may be expected to increase and the proportion of unavailing calls also to increase. The consequence is that the company is forced to handle more calls per telephone as the system becomes larger, and the price per telephone has to increase under flat rate charges; while the *subscribers limit their use of the telephone to their actual needs under measured rates and the number of calls per telephone does not have a tendency to increase as the system increases in size after it has reached a considerable development* such as is now found in the city of Chicago. Under these conditions the principle of wholesale production makes it possible for the company to reduce its cost of operating per message and thereby reduce the average price charged the subscribers.

The telephone hanging on the wall appeals to the average telephone subscriber as constituting the total expense to the company through the maintenance of the instrument and lines. The maintenance and the interest on the equipment does con-

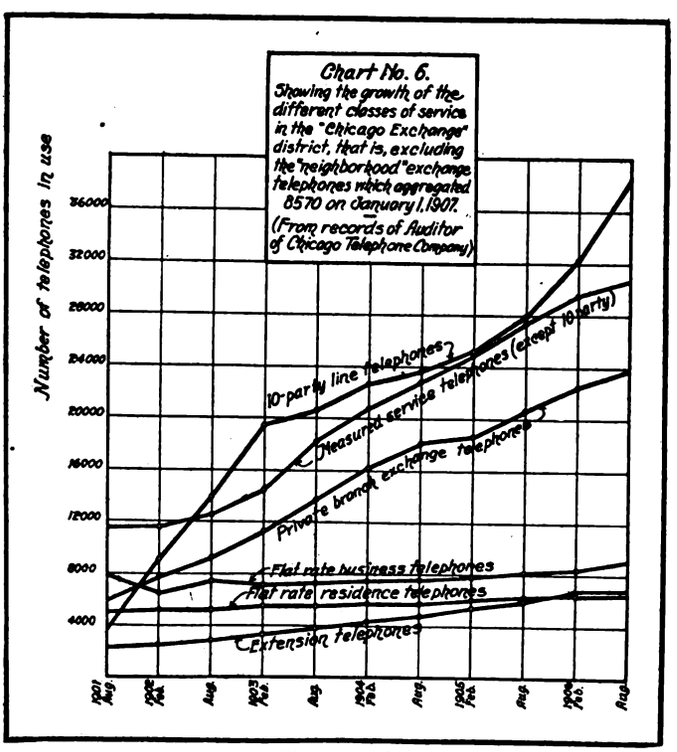

Chart No. 6.

stitute a considerable expense to the company, but a great deal of the expense to the company is due to the actual cost of handling each message.

Moreover, the more calls that are made per line, the larger must be the switchboards provided by the company for making connections for communication between subscribers' lines, since each operating employe can only take care of a limited number of calls per day, and if the number of calls per telephone increases, each operating employe can take care of the requirements of fewer lines. As the operating employes are increased, the switchboards must be increased at large expense to afford additional operators' positions, and all of this increases the annual expense for telephone service. The deterrent of a small charge per message, varying from a nickel downwards, depending upon the number of calls used per year, is sufficient to overcome much of this difficulty and to reduce the telephone service to a fairly uniform and business-like basis.

THE EDITOR'S PAGE

GOOD ENGINEERING.

NOW that the construction season has opened, and Independent telephone managers are arranging for the extension of their lines, both toll and local, it behooves the most careful planning on their part to so arrange that their work will be done in such a manner as to decrease the depreciation charge, the maintenance cost, and also to bear in mind the most efficient and labor-saving devices, so that the cost of construction may be kept at the minimum.

By giving some forethought to the construction work it will be possible to handle it to the best advantage, and at a lower cost than would otherwise be the case. If routes are laid out carefully, the population in the section to be built, and the probable growth in that section carefully figured, plans for future extensions can be developed to avoid the necessity of reconstruction in that particular section at a later date. Particular attention should be given to the securing of right-of-way permits, so that in the event of increase of realty values there will be no dispute as to the title on the ground occupied by lines.

Only the best quality of poles should be used. It is good policy in purchasing poles to secure them from some reliable concern, that may be held strictly accountable and to see that each pole will satisfactorily fill the specifications as laid down by the Cedarman's Association; that each is straight and has no butt rot. There are so many different kinds of pole preservatives on the market at the present time, which may be secured at trifling cost, that it will pay the exchange manager to look into this with the idea of impregnating the portion of the pole buried with some preservative so that it will not be affected by moisture ,and thus weakened, as is usually the case.

Much time may be saved in the construction of lines by taking advantage of the numerous tools and devices, such as pole derricks, post hole diggers and the like, which may be secured at a small initial expense, but which will in the end make large returns on the investment. It is good policy, not only for the sake of appearance, but for increasing the length of the life of the poles, to give them at least two coats of some good pole paint.

The poles should be well guyed, using substantial anchors that will have sufficient holding power not only to hold the lead in shape with the present lines upon it, but also allowing for future extensions. In this connection much time and money may be saved by resorting to devices of this nature, which are so plentiful. It is especially important that the leads should be well guyed into shape before the stringing of the wires. By guying the poles tightly before the lead is full the tension on the wires will tend to pull the anchors into a more solid position, and thus give them greater holding power.

In the guying and roofing of poles, it will be well to adopt some uniform method, such as is found in the specifications of any large operating company. The cross arms should be placed on the poles solidly in the most approved manner, together with the pins and insulators.

In the construction of toll lines it will be well to follow the specifications used by leading toll line companies, in order that the local companies in connecting with toll line companies, or giving toll service on their systems, may not handicap the toll service by having inferior construction.

Careful consideration should be given to the question of wire, using the highest quality and that best adapted for the purpose. The question as to tensile strength, the amount of sag at different temperatures, the carrying capacity of the wire and various items of a like nature should be well considered by the builder in order that best construction may obtain. The question of stretching wire with the greatest economy should be taken into consideration, so arranging that all of the wires on a cross arm may be pulled at the same time. The use of a horse or windlass in this connection will prove effective, and will result in the saving of much unnecessary labor on the part of the construction corps.

The important thing, however, is in knowing at all times exactly where one stands on the subject of construction, and too much thought and study cannot be given to this question by men who are desirous of uplifting the service and increasing the revenues of the company, and of lengthening the life of the construction to the maximum.

The exchange manager no doubt has records of some nature in his possession as to the cost of various leads of telephone lines which he has constructed in the past under various conditions. It will be well to make records of costs of construction and maintenance of a lead constructed under the most approved up-to-date specifications. Then by a comparison of these two sets of records it will be found that, while the initial cost is greater for first-class construction, yet in the end the difference will be so much greater on the credit side of the ledger that he will never again resort to construction that is not of the very highest grade.

The question of standardization of line equipment is one which has been bothering all Independent telephone operators for some time, and can be solved in no better way than by each individual construction man giving his very best thought and energies toward putting his lines in such condition that it will be impossible for any one to build better.

THE MOTORCYCLE.

IN these days of heavily loaded farmers' lines and a well developed system of toll lines, which are ever busy, the motorcycle has shown its advantage over the "horse and" method of handling trouble.

A good motorcycle placed in the hands of a good troubleman constitutes a combination that is hard to beat for trouble clearance. Maintenance is reduced to a figure that is barely perceptible, and where maintenance goes down, the dividends come up.

There is in use in an exchange in the middle west a motorcycle which the local manager states has traveled 5,700 miles, 4,500 of which were made on one pair of tires, and the repairs including the new pair of tires totalled $30.00. This, taking into consideration the amount of territory covered, the time saved, and the amount of good done by placing the toll and farmers' lines in service quickly after they were in trouble is but a small portion of that which would otherwise have been lost.

The motorcycle has passed the stage of experiment, and as a helpful adjunct to the troubleman's kit is without comparison. To the wire chief who has a handy man around, and who dreams of "two-bit maintenance," the motorcycle will be a godsend; to the other fellow who will have to send to the shop for every little repair—don't touch it; to the telephone company, watch it and compare your maintenance cost in a given territory after you have adopted it with costs in the same territory previous to that time. Note the value of the time saved on toll line trouble and compare it with the same lines before the advent of the motorcycle. The value of the machine will at once manifest itself. The results will be pleasing.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. McMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

TELEPHONE AS A NECESSITY FOR MINORS.

We are trying to collect a bill, incurred by a young man under age, for telephone rental. He had a telephone put in the house where he lived without his father's order, and we are trying to make him pay for it. This we cannot make him do, as he has no property nor funds, and his father refuses to pay, saying that he did not order the telephone. The father had the telephone taken out before it had been in the house very long, but we were put to considerable expense in installing it, and there is some rental due for the time it was there. Can we make the father pay the rental and cost of putting the telephone in? A. I. J.

THE father is liable for necessities furnished to his son, whether they are ordered by the father or not. If a telephone comes within the category of necessities, the father can be made to pay for it; if it is not a necessity, he is excused. What a necessity is depends somewhat upon the conditions and circumstances of the family, but we see of no way a telephone instrument could be considered as a necessity when furnished to a minor son and know of no case where it was held to be such. If the father did not order the telephone taken out as soon as he found it was installed, or if he permitted the men to come in the house and connect it, he might be held to have ratified his son's action and to have appropriated the contract himself.

BONDS AND NOTES TAXABLE AS PART OF CORPORATE FRANCHISE.

THE revenue agent for the State at large, of Kentucky, recently brought suit against the Cumberland Telegraph and Telephone Company, charging that in the years of 1900 to 1904 the company was the owner of bonds, notes, accounts, cash on hand, and stock in other corporations to the value of $5,000,000.00, which it had failed to list for assessment as required by law. The company contended that the property mentioned was included in the assessment of its franchise tax by the board of valuation and assessment, and was, therefore, not subject to assessment by the Board of Supervisors of the county in which suit was brought. The State law requires this board to assess a franchise tax upon all companies, which is obtained by fixing the value of the capital stock of the corporation, and from the amount thus fixed deducting the assessed value of all tangible property assessed in the State or in the counties where situated. The court held that the property involved in this suit was of an intangible character and not subject to assessment by the local assessor. Judgment was accordingly entered for the telephone company. Commonwealth vs. Cumberland Tel. & Tel. Co., 99 S. W., 604.

INJURY TO SERVANT EMPLOYED OUTSIDE REGULAR DUTIES.

THERE is no absolute rule applicable to all cases by which to determine the question of the liability of a company to its employee where the latter is injured in the performance of a duty which he was ordered or requested by the employer or his representative to perform, but the question of liability will depend upon the circumstances in each case. Where the master or his representative orders or requests the servant to engage in an employment outside the scope of the duties which the servant contracted to perform, the outside employment being attended by unknown and unobservable dangers, and the master gave no instructions with respect to such dangers, the servant is not deemed to have accepted the risk of such dangers in case of injury, and for such injuries the master is liable.

In the case in which the above principles were enunciated, a pipe fitter, employed by an electric company, was sent into a basement in the company's power house to assist in splicing a wire that had unexpectedly broken, thus stopping the operation of the company's line. Although the wire was a dead one when the employee went to work upon it, a 500 voltage current of electricity was unexpectedly turned on the wire and passed through the employee's body, causing his death. The company was held liable.

In the same case, an electrician of seventeen years' experience was asked whether precautions were necessary in repairing broken electric wires, and this question was held properly asked and answered by the witness. Jacksonville Elec. Co. vs. Sloan, 42 S., 516.

SALE OF TELEPHONE INSTRUMENTS AND TELEPHONE STOCK.

A PURCHASER contracted to buy a telephone instrument in the house of a firm and also telephone stock. It did not appear whether the stock was in a corporation or in an unincorporated concern, but this was held to be not material. The seller, after the purchaser took possession of the premises, offered to deliver the stock, and demanded payment, the telephone instrument being in the house occupied by the purchaser. It was held that the seller's offer to deliver the stock and the purchaser's refusal to accept it and carry out the agreement entitled the seller to recover the price. Reiley vs. Stephenson (Mo.), 94 S. W., 781.

NOT DESTRUCTION OF PROPERTY, BUT ACTION IN THE COURTS IS CITY'S REMEDY.

THE Illinois Court of Appeals has sustained the decision of the Circuit Court at Rock Island granting a temporary injunction to restrain the mayor and city from interfering with the apparatus of the Central Union Telephone Company, and the operation of its system. In 1887 the company was granted permission by an ordinance to erect a plant, but later this ordinance was repealed, and some of the company's poles chopped down because it refused to remove them. The court held that the ordinance did not grant a franchise, but simply a license, and thus holds that the ordinance does not contravene Section 14, Article II., of the Illinois Constitution, providing that no law shall be passed making an irrevocable grant of special privileges. The court holds the ordinance a contract that cannot be repudiated by the city. While the ordinance did not limit the period during which the company might maintain poles and wires in the streets, it did make a grant only for the life of the company in this instance, ninety-nine years from its organization in 1883. The court pointed out that the condition of the company's apparatus and the conduct of its employees was not as reprehensible as alleged by the city. The point of exorbitant rates could not be raised, because the city did not establish rates of telephone service in the ordinance of 1883, nor reserve the right to regulate that subject. The court held that, if the contract had been broken by the company, the city's remedy was not the destruction of property, but an action in the courts.

QUERIES

CABLE CAPACITY AND SPECIFICATIONS.—(861.)

Will you kindly advise the writer the manner in which the capacity of a cable may be measured? Also state the correct capacity to specify in purchasing cable. Any information you may be able to give us along this line will be greatly appreciated. A. D. S., Iowa.

A capacity test of cable is made in the following manner: First connect the two wires to a source of power, such as storage or primary batteries, allowing the cable to charge for about one minute. Then allow the cable to discharge into a voltmeter or galvanometer, noting the deflection. Then perform the same operations with a condenser of known capacity. The capacity of the cable will be in direct ratio to the capacity of the condenser according to the deflection.

In purchasing cable the following specifications are those generally used by the larger telephone companies: Copper conductors, 19 B. & S. gauge, 98 per cent. conductivity. Insulation to consist of one or two paper tapes. Conductors to be twisted in pairs (one of the pairs to have colored paper). Length of the twist not to exceed 3 inches. Pairs to be formed into a core arrangement in reverse layers. Core to be dry (unsaturated) except for two feet at each end. Sheath to be free from defects; to be of lead alloy with two and a half to three and a half per cent. tin, and of uniform radial thickness of 1-12 inch for 1 to 49 pairs; 3-32 inch for 50 to 99 pairs; 1-8 inch for 100 to 150 pairs. Insulation resistance at least 100 megohms per mile when laid, spliced and connected to terminals ready for use. Mutual electro static capacity (any conductor measured against its mate, with remaining wires grounded to sheath) .54 average and .6 maximum. The mutual capacities stated are equal respectively to .8 and .85 microfarad per mile regular capacity (each conductor against all the others grounded to the sheath).

These specifications are for the best class of cable construction, and where it is desired to keep the cost of maintenance to the lowest possible point it is advisable to use these specifications.

NUMBER AND SCALE OF VOLTMETERS ON TWO-POSITION TEST SET.—(862.)

Being about to install a second position on our test set we would like to ask your advice on some points about which we are in doubt. In the first place, is it necessary or desirable to use a voltmeter at each position or can we put in a switching key so that both testers can use the same instrument?

If we install a second instrument ought it to be the same as the first, or should they have different scales or resistance, so that we can use them on different classes of lines? P. F.

We understand that at first your second testing position will not be constantly in use, but rather designed to facilitate the prompt location of troubles in times of emergency, as, for instance, after a storm.

Under the circumstances it would be possible, by installing a switching key, to use the same voltmeter for both positions, and so make a slight saving in the initial expense. Such an arrangement, however, would not be economical in the long run. At times when both men are required to work together there would unavoidably be more or less confusion and interference with one another which would be productive of much annoyance and delay. Any saving effected by putting off the buying of a second instrument would be soon offset by the cost of the wasted time of the wire chief and his assistant.

With regard to the type of voltmeter for the second position, if the first is of satisfactory range, it is desirable to have a similar instrument at the second position. The two testers should be able to change positions at any time, and to work at either position with equal facility. Practice in testing enables a man to work very quickly, judging conditions on the line accurately from the behavior of the index pointer of the voltmeter. If the two instruments were not alike each would have to adjust himself to new conditions when he changed from one position to the other. This would unavoidably lead to a loss of time, and occasionally in the rush of work would be a source of error. By the use of similar instruments any possibility of these undesirable things would be avoided.

GENERATOR NOT UP TO VOLTAGE.—(863.)

We have a ringing machine for delivering pulsating current, belted to a small alternating current motor. It has never given satisfactory results, as it causes the bells to tinkle, but they will not ring sharply. We think the fields are weak and it does not come up to voltage. Can you suggest any way in which we can tell what is the trouble? R. P.

It is very likely that the trouble is simply that the armature of the machine does not rotate rapidly enough. We suggest that you find out what should be the proper speed in the first place to give the correct voltage to ring your bells. This should be furnished by the manufacturer either upon the name plate of the machine or may be obtained from him by asking him to refer to his records. The speed of the machine as it is in actual service should then be taken with a speed indicator. If it is not enough take also the speed of the motor, and measure the diameter of the motor and generator pulleys. A new pulley should be provided on either the generator or motor of such dimensions as to make the diameters of the two pulleys inversely proportionate to the required speed of the machines. As soon as you have the correct ratio between the pulleys you will probably have no difficulty in getting your generator to ring its bells.

TESTING BAD CORDS.—(864.)

Will you please describe to me the best way to test bad cords in a switchboard. What I want is some method which will enable the night operator to run through them quickly every evening after he has got through the regular rush of operating. B. N.

It is quite probable that you will have a noisy line in your exchange, or a line parallel to an electric light circuit. In the latter case, even if the line is quiet, it can be made noisy by taking out the mica between the carbons, or better still by grounding it by a little piece of wire. This will give you a steady hum upon one line. Cords can be plugged into the jack to which this line is connected, and as each cord is plugged in the corresponding listening key should be thrown. The operator should move his hand back and forth along the cord, bending it slightly and twisting it. Any crackling noise will indicate a broken piece of tinsel, and the cord should be marked in some way to indicate that it is defective. One method used is simply to draw the cord partially out of the socket and bend it over and insert the plug, tip downward, in the socket beside the cord. The trouble man upon going to work in the morning may withdraw these defective cords and repair them.

WIRES RUN IN TWISTED PAIRS.—(865.)

Our office is so arranged that it is necessary to run battery wires for transmitter supply to a magneto switchboard in a location where it would be difficult to conceal them. As they can be made up into a much neater cable if run straight than is possible with twisted pairs we would like to do this if it will introduce no difficulty. Will you please tell us how far wires may be run together without twisting before cross talk is noticed between two circuits? L. C.

The distance depends upon various conditions, such as the character of the insulation and its thickness, and a few other things; but it is sufficient to say that when wires forming both sides of a circuit are run untwisted beside another pair for only a few feet serious cross talk will be introduced in the switchboard. This is especially true of wires forming a primary talking circuit in a magneto board. Wires forming separate pairs should be twisted throughout their entire length, even if it is necessary to sacrifice appearances.

IN THE OPERATING FIELD

FIFTEEN THOUSAND TELEPHONES ORDERED FOR MILWAUKEE INDEPENDENT SYSTEM.

AT the annual meeting of the Milwaukee Independent Telephone Company, which has held on April 30th, several important matters were considered. The company has made a contract for furnishing material and performing the necessary labor to complete the installation of a telephone system with 15,000 telephones. By the terms of the contract the construction company is to provide the necessary grounds and buildings and install sufficient subway and main pole leads to permit of the increase of the plant to 75,000 telephones, as the growth of the business may require. This plant under the terms of the contract is to be completed and in operation by June 1, 1908. The directors elected at this meeting are as follows: John M. Baer, W. W. Cargill, C. J. Chapin, H. D. Critchfield, Howard Greene, J. C. Harper, B. G. Hubbell, Alvin P. Kletzsch, George P. Mayer, Wilmer Seig, Richard Valentine, J. S. Van Nortwick, E. A. Wadhams, Richard Wagner, J. B. Whitnall; and the officers are: President, H. D. Critchfield; vice presidents, E. A. Wadhams and J. S. Van Nortwick; secretary, C. J. Chapin; treasurer, Howard Greene.

MT. VERNON TELEPHONE COMPANY HOLDS ANNUAL MEETING IN NEW BUILDING.

THE Beaumont Telephone Company of Beaumont, Texas, held an exceptionally successful annual meeting in the new building at Mt. Vernon, O., which has just been completed, on April 24. The new structure has three stories, the lower floor being rented for business purposes, while the second and third floors are occupied exclusively by the telephone company. On the second floor are the quarters of the cashier and bookkeepers, and also the manager's office, the office of the secretary, a private office for consultation and the directors' room. The workshop and the office of the superintendent of construction are located on the rear of this floor. The switchboard and terminal apparatus will be located on the upper floor. It is expected that the apparatus will be installed and all equipment working in the new building by the first of October.

The stockholders heard reports from Secretary Henry C. Devin and Treasurer P. S. Kelser, showing that the company is free from indebtedness and in a highly satisfactory financial condition. Manager E. C. Breece gave detailed figures showing the satisfactory growth in each of the eight exchanges of the company and a reduction in expenses compared with last year by figures on a number of important classes of work. The average gains in different exchanges ranged from approximately ten to twenty-five per cent. in the number of telephones. At the conclusion of the meeting a banquet was held at which the stockholders enjoyed themselves thoroughly. The directors, re-elected for the coming year, are Frank L. Beam, P. S. Kelser, W. P. Bogardus, B. D. Herron, Rev. R. G. McClelland, Henry C. Devin and E. O. Arnold.

TO ENFORCE CONNECTION CONTRACT.

THE Beaumont Telephone Company of Beaumont, Texas, on April 10, asked the district court of that city for a temporary injunction restraining the Southwestern Telephone Company from connecting its lines or interchanging calls with the Southwestern Telegraph & Telephone Company at that point. The court refused to grant the order prayed for and the case will be decided later on its merits. A question of authority as to whether the company is bound by the action of its manager and secretary was raised by the defendant, but the court did not pass on this point, indicating that a jury might be necessary to decide it.

The facts in the case are reported as follows: The Southwestern Telephone Company is a Bell licensee, operating in western Louisiana, having Bell connections with the Cumberland at Lake Charles and Shreveport. Finding that its contract with the Bell was about to expire, it opened negotiations, through its secretary and manager, with the Independent companies at Shreveport, La., and Beaumont, Texas, with the result that contracts were made with both companies for an interchange of business and also an agreement was made with the South Texas Telephone Company for business over its lines to be effective October 1, 1906.

By the terms of the contract with the Beaumont Telephone Company, the Southwestern Telephone Company was to extend its line to Beaumont by that date, but owing to delay in receiving material, the extension was not started until after this time. Then it was discovered that the contract with the Cumberland company would not expire until October 1, 1907. It was also discovered by the Southwestern Company that its contract with the Beaumont Company had not been approved by the president of the company and further effort to connect with the Independent company was abandoned, but it continued with the extension of the line into Beaumont, without a positive statement that the line was to be connected to the Bell system.

PEOPLE ON PACIFIC COAST LEARNING MORE ABOUT INDEPENDENT TELEPHONES.

PORTLAND, Ore., is just now the scene of a whirlwind advertising campaign, which is keeping the people in that vicinity very much interested in telephone development. L. J. Wilde, who has charge of the distribution of the securities of the Home Telephone Company, is showing in a series of newspaper advertisements some of the reasons why Independent companies have been successful in other parts of the country. He has gone further than this, however, and some of his references to the local situation and the competitor of the Home Company, which he designates amusingly as the "Terrific Rates Telephone Company," strike home very keenly.

MEMBERS OF THIRD DISTRICT ILLINOIS ASSOCIATION MEET AT PRINCETON.

PRESIDENT F. M. ASHE, of the Third District of the Illinois Independent Telephone Association, called to order an exceptionally well attended meeting of the members of his district on April 25 in the building of the Bureau County Independent Telephone Company, Princeton, Ill. Among those present at the meeting were C. B. Cheadle, of Joliet, secretary of the State Association and of the Dixon Home Telephone Company; C. A. Camp, of Davenport, secretary of the Henry County Telephone Company; H. H. Bratt and T. W. Miller, of Rock Island; H. E. Pancost, of Mendota; John H. Drawyer, of the Empire Telephone Company of Bradford; John F. Atwater, of Neponset; John Dunne, of Bradford; O. L. Hatch, of Kewanee; C. O. White and S. S. Harriss, of the Bureau County Independent Telephone Company, Princeton; J. W. Ross, of Walnut; C. B. Keigwin, of the Bureau County Company and of the Green River Telephone Company, and W. H. Kugler and Benjamin F. Swab, of the Green River Telephone Company, Harmon.

Secretary Cheadle gave a very interesting talk, outlining the progress of Independent telephone companies in the past year, and referring to the benefits of a more thorough organization which have been so manifest. He particularly urged that everyone connected with the Independent telephone business

Digitized by Google

should be present at the State convention, to be held May 14 and 15 at Springfield. At this meeting the question of treatment to be accorded to mutual companies was discussed at some length. Those present were practically agreed that mutual or farmers' companies should be encouraged in every way to build up their own territory as such associations must eventually become feeders for the larger companies operating in the centers of population. Officers were elected for the coming year as follows: President, F. M. Ashe, Kewanee; vice president, John H. Drawyer, Bradford; secretary, W. H. Miller, Rock Island; treasurer, C. O. White, Princeton; executive committee, F. M. Ashe, H. W. Miller, C. O. White, H. C. Barbour, H. H. Bratt, John Dunne and H. E. Pancost.

W. H. Kugler, of the Green River Telephone Company, Harmon, was selected as one of the delegates to the State convention.

MEMBERS OF THE SEVENTH WISCONSIN DISTRICT ASSOCIATION MEET AT LA CROSSE.

IMPORTANT matters of mutual interest regarding rates, territory, etc., were discussed by members of the Seventh District of the Wisconsin Independent Telephone Association when they came together recently at La Crosse, Wis. Among those present at the meeting were ex-Senator John C. Gaveney, of the Trempealeau County Telephone Company; Howard Teasdale, of the Monroe County Telephone Company; George Beyer, of the Westby Telephone Company; Granville Hall, of the Cashton Telephone Company; E. J. Kneen, of the Bangor Telephone Company; W. F. Goodrich and H. M. Rounce, of the La Crosse Telephone Company, and C. H. Schweizer and J. G. Schweizer, of the La Crosse Interurban Telephone Company.

It was found that by carefully considering the matter of apportionment of the new territory in such a session the members could arrive at most beneficial results. There is a certain lack of uniformity in rates in rural service to which the members are now giving their attention, and they hope before long to be able to standardize the service, and then the natural result will be the charging of uniform rates.

IDAHO FARMERS REFUSE TO DEAL WITH BELL COMPANY.

FARMERS in the neighborhood of Kendrick, Idaho, have established a network of lines which thoroughly cover the rural districts. For some time past the Pacific States Telephone Company (Bell) has been making earnest efforts to get the farmers' lines to connect with its system. Many meetings were held, at which the agents of the company tried to persuade the farmers to enter into an agreement for the exchange of service, but features of the Bell contracts which were presented to them apparently did not appeal to the farmers as just or as preserving their interests in their lines, in the construction of which they have gone to considerable expense. The result has been that the Interstate Co-operative Telephone Company, which operates an Independent exchange at Kendrick, has been able to obtain contracts for connection with all these lines, and will give them an outlet to other important cities in that vicinity through a large new switchboard which it has installed to take care of its increased business.

BELL LICENSEE BEING VIGOROUSLY OPPOSED AT ABERDEEN, S. D.

ALTHOUGH its management has persistently endeavored to convey the impression that the Dakota Central Telephone Company is an Independent concern, it has for a long time been well known that it is closely affiliated with Bell interests. It is now bearing the natural consequences of its attitude in the shape of vigorous opposition in the city of Aberdeen. The Groton-Ferney Mutual Telephone Company, with local exchanges at Groton, Ferney, Verdon, James, Warner, Andover, Putney, Bath, Columbia and Mellette, is endeavoring to obtain a franchise to operate in Aberdeen, the county seat, and is meeting with general support from the people of the State. Apparently the city council is inclined to support the Bell licensee company, as considerable pressure was brought to bear upon the matter. The latest action taken was the passing of a resolution by the county commissioners, stating that the Bell telephones would be ordered out of the court house unless the city council should permit the Groton-Ferney Mutual Telephone Company, which has a great many rural subscribers, to build its lines into the city. The situation has not yet been settled, but owing to the advisability of allowing the large number of farmers in the surrounding country to have connection with the city it seems extremely likely that the city council will withdraw its opposition to the Independent company.

GRANTING OF FRANCHISE ENJOINED.

AT Hawes Valley, O. T., Judge Dickerson has issued an injunction restraining the mayor and recorder of Sulphur from putting into effect the franchise recently granted to Edward J. Hines to operate a telephone exchange there. The injunction was issued on the application of the Sulphur Telephone Co., which claims an exclusive franchise under an ordinance of 1900. The city claims that the Arkansas laws, which are still in force in Indian Territory, prohibit exclusive franchises.

BLAKE INSTRUMENTS HANDED OUT TO LOUISIANA BELL SUBSCRIBERS.

IN localities where the Bell companies are forced by competition to keep their service up to a high standard the Blake instrument has been taken out of service for so long a time that its existence has been almost forgotten by the general public. This is not so in a number of places, however. Reports from Crowley, La., indicate that the Bell company is still following the old game of forcing subscribers to pay high rates using "long distance" instruments as the pretext.

The reports state that Manager Thomas of the local exchange of the Cumberland Telephone and Telegraph Company, of Crowley, has been authorized to say that persons desiring local telephones at the rate of $1.50 per month may use only the Blake instruments on a grounded line. If they want long distance telephones with metallic connections they must pay $2.00 per month. Considerable indignation has been aroused by this announcement, and opposition to the attitude of the company is said to be strong.

PROVIDENCE BUSINESS MEN URGE GRANTING OF FRANCHISE TO INDEPENDENT COMPANY.

THOUSANDS of residents of the city of Providence, R. I., have expressed their opinion in favor of the Independent company, but the latest petition to be presented to the committee of the city council, which is considering the matter, is one signed by many of the most prominent business men of the city. This petition sets forth that competition between telephone companies is the best method of bringing the telephone to the normal position it should occupy in the city. The petitioners state that they do not believe that telephone subscribers should be bound by monopoly, or be required to pay, through its excessive rentals, tribute to the American Bell Telephone Company and to continue to pay on a capitalization greater than the business warrants. The names which are on this petition represent some of the most important business interests in the State of Rhode Island.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

SECOND HAND switchboards for sale—2 100 capacity Chicago Telephone Supply Co.; 1 200 capacity and 1 100 capacity Western Telephone Construction; 1 100 capacity Swedish-American; 2 50 capacity and 2 100 capacity Eureka; 1 100 capacity Standard; 3 100 capacity Keystone; 3 200 capacity and 1 100 capacity North. Address Victor Telephone Works, 6583 State St., Chicago, Ill. 817

FOR SALE—Cheap. I. C. S. Telephone Engineering by mail, complete with bound volume. Address Box 829, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 829

WANTED—To sell a country telephone system with 125 miles toll line and two small exchanges in Eastern North Carolina. A good investment, especially for one who wants to locate in the South. Address Box 833, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 833

FOR SALE—500 Eureka express drops with or without cabinet, in good condition, at a bargain. Address New State Telephone Co., Sioux City, Iowa. 838

FOR SALE—Post hole digging, hoisting and cable pulling machine mounted on trucks. Also one No. 6 cube concrete mixer, and other construction apparatus. Above used four months. Address Quincy Home Telephone Co., Quincy, Ill. 839

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED.—Competent man as superintendent, also first class switchboard repair man. Good salary for first class man. None other need apply. Address, Box 821, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 821.

POSITION WANTED—A first class man wants to make change. Would like position as Manager or Wire Chief. Twelve years' experience. A-1 reference. Address, Box 825, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 825

WANTED—Position by good troubleman experienced in line, office, and instrument trouble. In other respects am willing to render myself generally useful. Satisfactory testimonials. Address Box 828, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 828

WANTED---Continued

SITUATION wanted by experienced man as wire chief or switchboard repair man and troubleman for common battery plant. Address Box 830, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 830

POSITION WANTED—An experienced and capable telephone man desires employment as exchange manager, or any responsible plant or maintenance position. Can furnish excellent references. Address Box 831, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 831

WANTED—Operators with experience on multiple board. Will pay $30.00 per month and transportation on six months' contract. Address Peninsular Telephone Co., Tampa, Fla. 832

WANTED—First class magneto troubleman, for town and country work. Right man gets division after trial. State salary expected and reference in first letter. Good opportunity for good man. Address R. C. Cutting, Gen. Mgr., La Grange, Ind. 834

WANTED—Position by married man of 24 as bookkeeper or collector, six years' office experience. Wishes to learn management of exchange. Address Box 65, Jonesboro, Ind. 835

WANTED—Position with telephone company on construction or instrument work. Five years' experience, best of references. Address Box 836, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 836

WANTED—A man to work extra on magneto trouble, help with cable work, also to be capable to work on common battery switchboard and in repair shop Address Box 837, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 837

WANTED—To operate small country switchboard not over 100 line, with living rooms on the premises. 12 years' experience. Address Box 823, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 823

WANTED.—The management of an electric light plant where the business can be built up. Have had experience and can "deliver the goods" on any electric lighting proposition. Open for engagement after July 1, 1907. Address Box 816, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 816

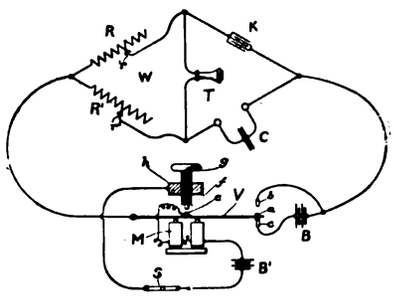
TELEPHONE PATENTS

CAPACITY MEASURING APPARATUS.

Harry Shoemaker, Jersey City, N. J., patents (No. 850,064, dated April 9, 1907; filed October 9, 1906; serial No. 338,100) apparatus for measuring electric capacity.

This invention comprises the arrangement of a Wheatstone bridge in connection with a vibrator, two sets of primary batter-



ies, a known and variable resistance, R and R', a variable condenser of known capacity, K, and the condenser C, of which the capacity is desired.

The closing of the switch S causes an actuation of the vibrator V which charges and discharges the condensers K and C. By moving the variable resistance R and the variable condenser K an electrical balance is secured in the two limbs of the Wheatstone bridge so that no noise is distinguishable in the telephone receiver T. By noting the position of the resistance R and the condenser K the capacity of the condenser C is determined.

TRANSMITTER FACE.

Stephen G. Houghton, Rome, N. Y., patents (No. 851,355, dated April 23, 1907; filed March 7, 1907; serial No. 361,070) and assigns to Wire and Telephone Company of America, Rome, N. Y., a telephone transmitter.

While this patent calls for a telephone transmitter yet nothing is described or claimed aside from the form of construction of the face plate, which is substantially as follows:

A transmitter face plate having an inwardly extending perforated groove and a hole covered by a disk which is held in place by a rib formed by the groove, the disk being slightly convex in shape. No mouthpiece is used with this transmitter face plate. The manner of construction being a means of securing a transmitter in which a minimum of disturbance occasioned by noises other than the speech are experienced; also to prevent the accumulation of dust or dirt in the transmitter proper.

HEAT COILS.

Arthur H. Adams, New York, N. Y., patents (No. 851,051, dated April 23, 1907; filed October 9, 1905; serial No. 281,932) and assigns to Western Electric Co., Chicago, Ill., a heat coil.

This patent covers a form of heat coil of the self-soldering type together with a retaining cap which holds the heat coil in position on the arrester frame.

The coil comprises a metal pin extending through a spool upon which is wound wire of such resistance as to produce heat when an abnormal current traverses it, and a fusible material which holds the pin securely in the spool. The heat in the resistance wire during the passage of excessive current softens this fusible material sufficiently to allow the pin, by virtue of the pressure exerted upon it by a spring in the frame, to slide in the coil sufficiently to impinge against another spring electrically connected with the ground. Together with the heat coil there is described a cap which slides over the coil and by means of which the coil is retained in its proper position on the arrester frame. This cap is engaged with the pressure exerting spring and serves merely for the purpose named. By cooling, the fusible material again solders the pin in the spool, thus making it necessary only to reverse the position of the spool in the cap to again place the line in its normal condition.

RECEIVING DEVICE.

Isidore Kitsee, Philadelphia, Pa., patents (No. 846,414, dated March 5, 1907; filed April 10, 1905; serial No. 254,768) and assigns one-half to William J. Latta, Philadelphia, Pa., a receiving device for electric transmission.

This patent covers an arrangement of an inductorium with taps on the secondary at different points, a switch for completing the circuit between these points and a source of power, a receiving apparatus and air gap adjusters. The object of the whole being the ready reception of currents of small intensity as in wireless transmission of messages.

GROUND CLAMP.

Warren R. Cox, Cleveland, Ohio, patents (No. 846,400, dated March 5, 1907; filed February 19, 1906; serial No. 301,802) and assigns to George R. Blackburn, Cleveland, Ohio, a clamp for ground wire electrical connections.

The inventor describes in this patent a form of clamp for pipes consisting of a metallic strap having a number of perforations along a portion of its length, any one of which may be engaged by a retaining button. This strap is more securely tightened to the pipe by means of a machine screw passing through the strap and a solid piece attached thereto and pressing against the pipe.

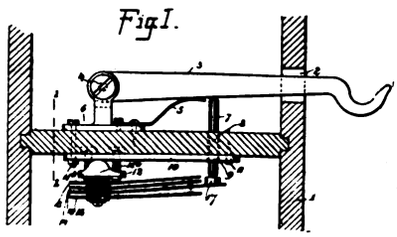
The wire is attached by means of a nut threaded on the machine screw.

SWITCH HOOK.

Alfred Larsson, Buffalo, New York, patents (No. 851,761, dated April 30, 1907; filed May 22, 1906; serial No. 318,148) a telephone switch hook.

This invention relates to a form of switch hook, the particularly commendable feature being the manner of construc-

Fig. 1.



tion which allows of the adjustment of the springs at any angle. The switch springs are mounted together with the insulation on the rocker 18*a*, which allows of tilting the switch to the proper adjustment either forward or backward by the screws 12.

The plunger 7 is of an insulating material and causes the opening or closing of the switch circuits according to the movement of the receiver hook 3.

STOMBAUGH GUY ANCHORS

Over that of the "dead man" or any other anchor on the market? There is no post hole digger necessary, no ground to be tamped. It is made in one piece and has no moving parts that may open (or may not open).

Two men can screw an anchor in the ground while the other is attaching the guy wire to the pole and putting the thimble through the eye of the anchor, and has his block and tackle ready for the helping hands of the other two men, at the same time they finish boring in the anchor. In 15 minutes they are finished and are off to anchor the next pole.

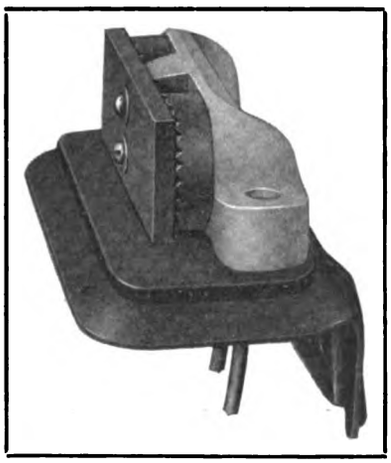
IN THE MANUFACTURING FIELD

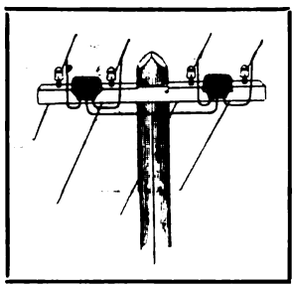
"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"



Mechanical Construction Chapman Arrester.

NEW LINE LIGHTNING ARRESTER.

AN arrester for the line is a rather new departure in protective devices, and one well worthy of serious consideration, inasmuch as when a storm is passing over a line it will cause a rise in static potential on a section of the line directly under it, which gradually accumulates until a discharge takes place between the clouds and the line. If no other path to earth is provided, a wet or even a dry pole will serve the purpose, generally resulting in the destruction of one or more poles. This discharge or equalization of potential results in a surge on the line, which manifests itself at the station arresters and equipment.



Chapman Arrester Placed on Cross Arm.

It is the purpose of the Chapman lightning arrester to keep the line discharge below the striking point, as the arrester is so constructed that the air gap offers practically no resistance to the high potential force of the lightning. These line lightning arresters are not intended to displace any of the present forms of station arresters, but rather to relieve them of the brunt of the storm, which they are usually unable to withstand.

The Chapman lightning arrester is so constructed that the air gap is about double that of the ordinary station arrester, and will not clog up under the most severe service, owing to its arrangement and self-cleaning features. It is neatly constructed, mounted upon an iron frame and enclosed in a stamped steel case, which protects it from the weather and other opportunities for damage. The Minnesota Electric Company, 309 Second avenue South, Minneapolis, Minn., manufacturers of this arrester, will be pleased to mail booklet descriptive of their product to any one upon receipt of a request.

S. H. COUCH CO., 156 Purchase street, Boston, Mass., has just issued an exceptionally interesting booklet describing the Couch intercommunicating systems. It is well known that these are based upon the Couch automatic reset switch, a piece of apparatus which is being extensively used in various parts of this country and in Canada. It lends itself readily to various styles of mounting and the company manufactures wall sets of both the box and flush type for use in residences.

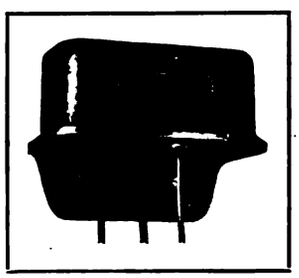
Some of the advantages of the switch itself, the construction of which is shown in illustrations in the booklet, are stated to be that it will not warp because the supporting frame work is entirely of metal rigidly put together, and rubber, although used for insulation, does not enter into the supporting part of the framework; any material that would rust is not used in construction of the switch; sticking of parts is prevented by very accurate machine work so that the buttons are said to have a thorough reliable action. This switch is used for three classes of service, namely, intercommunicating service with trunk to common battery exchange, intercommunicating service with trunk to magneto or automatic exchange, and a third class intended for intercommunicating service with a trunk connecting to a magneto call exchange with provision for cutting over to a common battery central office without any change in the intercommunicating telephones. The use of this switch has in many cases brought to telephone companies considerable additional revenue, and the S. H. Couch Company reports that it is being investigated by a very large number of up-to-date companies.

JULIUS ANDRAE & SONS CO., 99 West Water street, Milwaukee, Wis., is sending out a circular showing the Eclipse Battery Ammeter, which may be readily applied to dry batteries for a quick test without the use of cords and clips. The terminals of the ammeter are so arranged that they may be brought instantly into firm contact with the electrodes of the battery.

Although the price is low, the company states that the instruments are accurate and the adjustment permanent. Telephone men will find it advantageous to learn all about the instrument.

THE FAHNESTOCK ELECTRIC CO., 129 Patchen avenue, Brooklyn, N. Y., has recently issued a folder giving five good reasons why the Fahnestock spring binding posts should be specified on dry batteries and various other pieces of apparatus. Interested persons can find out what these reasons are by writing to the company for its attractive folder.

MIX & GENEST, Berlin, Germany, exhibited a very fine line of telephone apparatus at the Milan Exposition in 1906, for which a grand prize was awarded. Included in this exhibition were systems for local and long distance telephoning, house instruments and specially designed apparatus for railway, army, marine and mining systems, and various other special classes of telephone work. This company issues very attractive catalogues printed in German showing details of a great variety of its telephone apparatus. It also publishes in English a manual on field telephony, which shows a compact type of telephone, with light, specially designed auxiliary apparatus, which is used by the German army in the field.



Weatherproof Containing Case.

THE TRUMBULL ELECTRIC MFG. CO., Plainville, Conn., is just now getting out some especially effective advertising matter. It appeals to the eye in a striking manner, and sets before the reader some statements about the well known Trumbull switches, which ought to appeal to his best judgment. The company will send some of these folders and booklets to those who are interested in obtaining high grade, thoroughly reliable knife switches upon receipt of a request.

THE WEEK'S MESSAGES

NEW COMPANIES.

STEPHENS, ARK.—An Independent telephone company has been organized and a line constructed between Stephens and Woodlawn. Among those interested in the company are J. M. Hodge, R. W. Arrington, J. P. Robertson, J. W. Starritt, Sam Taylor, G. A. Simpson, C. B. White and J. H. Rogers.

COLORADO CITY, COL.—An Independent telephone company has been organized by several leading citizens of this city, which has back of it, it is understood, New York capital. Among those actively interested in the enterprise is F. J. Pickens, who some time ago, after securing the property of the El Paso Telephone Company, formed the Home Telephone Company, and has since been running it under the franchise of the El Paso Company. It is the intention of the new company to apply for a twenty-year franchise, and if it is granted construction of the new system will be commenced at once. The general offices are to be located at Colorado City, and the company will operate in competition with the Colorado Bell Company.

CUNNINGHAM, KY.—The East Cunningham Telephone Company has been incorporated with a capital stock of $1,050. The incorporators of the new company are D. B. Elsey, W. J. Beard and T. W. Burrow, and it is its intention to construct a line from Cunningham to Bardwell.

OWOSSO, MICH.—The Conway-Antrim Telephone Company has been incorporated with a capital stock of $1,000, and lines will be built to Fowlerville, Byron, Morrice and Shaftsburg.

EFFINGTON, MINN.—Articles of incorporation have been filed by the Effington Telephone Company. The company is composed of farmers, who contemplate the establishment of a telephone system in the town of Effington and vicinity. It is capitalized at $5,000, with the privilege of increasing to $50,000. The officers of the company are Thomas Koep, president; John Hardekopf, vice president; Geo. J. Kraemer, secretary and treasurer.

SAUK CENTRE, MINN.—An Independent telephone company, whose object is to build lines from Sauk Centre through Getty to Brooten, has been organized in this city.

UNION, MO.—The Commercial Telephone Company, of Union, with a capital stock of $8,000, has been incorporated by A. J. Gorg, A. E. Reinhard, A. H. Mauthe, A. Kramolowsky and O. E. Meyersieck.

AURORA, NEB.—The Farmers' Telephone Company, of Aurora, has filed articles of incorporation. It has an authorized capital stock of $10,000, of which $2,500 has been paid up. Among the incorporators are John George, H. F. Jansen, O. B. Rush, D. H. Wilkins, J. P. Huebert and William Hagemeister.

DENTON, NEB.—The Kramer-Denton Company has been incorporated with a capital stock of $25,000. The incorporators are B. G. Miller, S. A. Hensley, C. F. Miller, William J. Miller and F. C. Miller.

ELYRIA, O.—The Lorain County Home Telephone Company, whose intention it is to operate in Lorain, Medina, Cuyahoga and Erie counties, has filed articles of incorporation. The capital stock of the company is placed at $750,000, and Elyria is named as the headquarters. It is understood that the new company is a merger of a number of companies operating in Lorain county.

NAPOLEON, O.—The Henry County Mutual Telephone Company has been incorporated by David Horman and others.

GUTHRIE, OKLA.—A farmers' telephone company is being organized and will shortly be incorporated. It is to be known as the Guthrie, Iron Mound & Cedar Townships Telephone Company, and it is its intention to construct and operate lines between the points mentioned. J. P. Thomas, who has been named as vice president, and J. L. Christy are among those interested.

ROSCOE, PA.—The Roscoe Telephone Company, with a capital stock of $5,000, has been incorporated, and the following directors named: B. L. Lamb, W. C. Smith, T. J. Underwood, California; J. H. Underwood, Roscoe.

PRINGLE, S. D.—An Independent telephone company, to be known as the Point of Rocks Telephone Company, has been organized by the people of Pringle. It is the intention of the new company to build lines into Custer and Hot Springs, and the following officers have been elected: J. W. McClaren, president; R. J. Turner, secretary.

PUKWANA, S. D.—The Pukwana Telephone & Electric Company has recently been organized, and work will be commenced on its system at an early date.

ACTON, TEXAS.—The Acton Telephone Company, of Acton, has been incorporated with a capital stock of $8,125.

GREEN RIVER, UTAH.—An Independent telephone company has been organized and the following officers elected: Frank Cook, president; R. M. Eldred, Ervin J. Cook, vice presidents; R. M. Eldred, treasurer; F. A. Beaumont, secretary; G. P. Schlosser, general manager. It is proposed by the new company to erect its own exchange building and install a strictly up-to-date plant.

MANTI, UTAH.—An Independent telephone company, to be known as the Manti Telephone Company, is being organized at Manti, and $4,000 has already been subscribed. The Manti company will establish a local line for the city, with the latest improved apparatus. The organization of this copmany has been brought about by the desire of the citizens to discard Bell telephones and establish a strictly Independent system.

APPOMATTOX, VA.—The Appomattox Telephone Company has been incorporated with a capital stock of $5,000, maximum; $1,000, minimum. The incorporators are H. D. Flood, S. L. Ferguson, J. R. Horsley, J. R. Atwood, B. F. Oden, all of Appomattox.

YUBA, WIS.—Articles of incorporation have been filed by the Pine River Telephone Company, of Yuba. It has an authorized capital stock of $1,500, and the incorporators are M. B. Lewis, John Fonta, B. K. Borland and others.

CORNWALL, ONT., CAN.—A new telephone company has been formed at this city to be known as the Glengarry Telephone Company, with Donald McCaskill, of Laggan, as president.

FRANCHISES.

LA PORTE CITY, IA.—Application for a franchise at La Porte City has been made by the La Porte City Farmers' Mutual Telephone Company.

ELKINS, W. VA.—The Citizens' United Telephone Company is to make application for a franchise to build and maintain telephone lines over the roads of Randolph county.

ELECTIONS.

YELLVILLE, ARK.—The following officers and directors have been elected by the Yellville Telephone Company: W. R. Jones, president; L. Weast, secretary and treasurer; S. Brooksher, R. L. Berry, W. R. Jones, M. Weast and W. S. Chastain, directors.

SAN FRANCISCO, CAL.—The directors of the Direct Line Telephone Company are Julius Frick, A. Koch Andriano, William T. Hess, Julius Fay and Charles E. Wiggin.

Directors: L. F. Harris, Ben Schmid, Joe Mikeska, T. A. Low, E. R. Knolle.

RICE LAKE, WIS.—The Barron County Telephone Company has elected the following directors: De Witt Post, T. W. Borum, J. E. Horsman, C. J. Borum.

MISCELLANEOUS.

RED OAK, IA.—The Montgomery County Telephone Company has been reorganized. The new officers are H. E. Deemer, of Red Oak, president; H. N. Havener, Marengo, vice president; H. S. Rogers, Red Oak, treasurer; F. M. Chandler, secretary and manager. The capital stock of the company is $50,000, of which $41,800 has been issued.

INDUSTRY, ILL.—The incorporators of the newly organized Industry Telephone Company are R. F. Butterfield, J. P. Young and Fred Rexroat, and the capital stock is given at $6,000.

BALTIMORE, MD.—The incorporation of the Maryland Telephone Company by Messrs. W. T. Spring, R. F. Bonsall, W. H. Martin, E. P. Hill and A. Y. Pindell, with a capital stock of $1,000,000, it is understood is for the purpose of consolidating the Maryland Telephone and Telegraph and Baltimore Electric Power companies under the name of the Baltimore Electric Power Company.

GRAPELAND, TEXAS.—The local telephone system at Grapeland, Texas, formerly owned by Dr. McCarthy, has become the property of Mr. Cook, of Crockett.

SAN ANGELO, TEXAS.—The Dixie Telephone Company, owned by Dr. Bascom Lynn, of San Angelo, and Norman K. Weaver, of Sweetwater, has sold its Bronte-Sweetwater line and exchanges at Bronte, James and Fort Chadbourne for $9,500 to Messrs. Jerry and Jack Rust, owners of the San Angelo Telephone Exchange.

LEWISBURG, WEST VA.—The Greenbrier & Organ Cave Telephone Company, Greenbrier, formerly owned by M. A. Gates, has been acquired by H. L. Van Sickler, John Laing, James Laing, R. L. Telford, K. M. Snyder, A. M. Bell and others of Lewisburg. It is the intention of the new owners to improve the plant.

SHOAL LAKE, MAN., CAN.—The telephone system formerly owned by Messrs. Randall & Greenshaw, which runs from Shoal Lake to Kelloe, and which serves Solsgirth, Lone Tree and Rossburn, has become the property of W. J. W. Bolton.

New Construction in the Field

CONSTRUCTION.

CAIRO, ILL.—The Home Telephone Company expects to make many improvements in its system in this city.

MT. MORRIS, ILL.—New lines are being strung by the Ogle County Telephone Company to take care of its increasing business.

CARMEL, IND.—A new switchboard is to be installed by the Carmel Telephone Company, and its service further improved by the building of a new line to Westfield.

COLUMBIA CITY, IND.—The lines of the Farmers' Mutual Telephone Company are being extended.

PERU, IND.—Connection is soon to be established with Indianapolis by the Peru Home Telephone Company. Pay stations are to be installed at Miami and Bennett's Switch, and thousands of dollars worth of new cable put up in the city of Peru.

RICHMOND, IND.—A sub-station is to be erected by the Home Telephone Company in this city.

WEST BADEN, IND.—The Mathews & Ham Telephone Company is improving its system.

BIDWELL, IA.—It is the intention of the Bidwell Telephone Company to connect the Bidwell line with the Ottumwa Telephone Company's lines at South Ottumwa.

COUNCIL BLUFFS, IA.—The switchboard of the Independent Telephone Company has been enlarged to take care of its increased business. In addition to this, new toll lines are to be constructed in Iowa, and a new station installed at Underwood.

ELLIOT, IA.—Among the improvements planned by the Elliot Central Telephone Company are the installation of a new switchboard, and the construction of new lines.

WEBSTER, IA.—New lines are being erected by the Martin Telephone Company, and its system otherwise improved.

BURLINGTON, KAS.—A new switchboard is to be installed by the Burlington Telephone Company, and new lines built to Lamont, Hill Top and other points.

GROVE CITY, MINN.—A number of extensions are planned by the Grove City & Rosendale Telephone Company, and work will be commenced at an early date.

KASOTA, MINN.—The Nicollet County Telephone Company is extending its lines from Kasota to Lake Washington, and contemplates the erection of many miles of new system during the present year.

MANKATO, MINN.—It is the intention of the Citizens' Telephone Company of this city to construct a new line from Minneopa to Judson.

HELENA, MONT.—Work on the construction of its new exchange building will shortly be commenced by the Montana Independent Telephone Company, of Butte.

WARREN, N. H.—The Baker's River Telephone Company is reconstructing part of its plant, and expects to make it strictly up to date in every particular.

WEST POINT, NEB.—The Cuming County Telephone Company, which some time ago secured a franchise in this city, expects to extend its line so as to give service to residents of the county seat.

BYRON, N. Y.—It is the intention of the Byron Telephone Company to commence the extension of its lines very soon.

CENTER BRUNSWICK, N. Y.—The lines of the Commercial Telephone Company are to be extended north of the city.

HUNTER, N. Y.—Among the extensions planned by the Scoharie Valley Telephone Company is a line to Phoenecia, where connections will be made with the Citizens' Standard Telephone Co.

LEONARDSVILLE, N. Y.—The Leonardsville Telephone Company is extending its system from this city to Bridgewater.

HENDERSON, N. C.—The system of the Home Telephone & Telegraph Company is to be entirely rebuilt, and the company expects to make its plant one of the most complete in the state.

JAMESTOWN, N. D.—It is the intention of the North Dakota Independent Telephone Company to build a long distance line from Jamestown to Melville, passing through Pingree.

DOYLESTOWN, O.—The system of the Doylestown Telephone Company is being extended in this city, and lines are to be erected southeast and west of the town.

NEW RIEGEL, O.—It is the intention of the New Riegel Telephone Company, which is now at work on its plant in this city, to establish connections with the exchanges at Bascom and Alvada, and with the Home Telephone Company at Tiffin.

WAMEGO, O.—Extensive improvements in its plant are contemplated by the Wamego Telephone Company, among which is the installation of a new switchboard.

LOOMIS, S. D.—The Schuler-McCurdy Telephone Company has commenced the installation of its system in Loomis.

BEEVILLE, TEXAS.—A telephone line from Beeville to Oakville is to be erected by G. W. West.

CLARESHOLM, ALB., CAN.—The Calgary Telephone Company, Calgary, Alb., Can., has decided to install a telephone system in this city.

KASLO, B. C., CAN.—Arrangements have been practically completed by the Kaslo & Slocan R. R. to build a long distance telephone system along the route of the railway, with branches to connect with the most important mines in the districts touched. All telegraph instruments are to be removed, and the railroad operated by telephone.

MINNEDOSA, MAN., CAN.—The municipalities of Odanah, Minto and Clan William, immediately adjacent to this town, are to install municipal telephone systems. Address Reeve Christopherson, of Clan William, Clan William P. O., Manitoba; Reeve Sparling, of Odanah, Minnedosa, Manitoba, and Reeve Cameron, of Minto, Minto P. O., Man., Can.

TORONTO, ONT., CAN.—Standard specifications are being prepared by the provincial government and will be given out to Ontario municipalities as required. The idea is to have uniform systems throughout the province. Address J. J. Foy, minister of works.

WOODSLEE, ONT., CAN.—The municipality of North Essex has decided to install a rural telephone system. Address M. N. Mosseau.

SWIFT CURRENT, SASK., CAN.—The board of trade has appointed a committee to look into the financial arrangements necessary for building a municipal telephone system. Address J. G. Maxwell.

WARMAN, SASK., CAN.—The council has decided to build a municipal telephone system this summer. Address the Mayor.

UNDERGROUND.

SOUTH HAVEN, MICH.—The Kibbie Telephone Company is placing some of its wires underground in this city.

HELENA, MONT.—Considerable conduit work is to be done by the Montana Independent Telephone Company, of Butte, in this city.

POTTSTOWN, PA.—The Bell company has applied for privilege to place its wires underground in Pottstown.

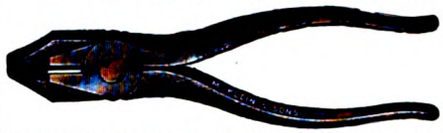
BEWARE OF IMITATIONS


For the protection of our customers we advise that Klein's Pliers are being imitated to LOOK LIKE KLEIN'S. This, however, does not make them Klein's.
CAUTION. Look for this stamp, M. KLEIN & SONS, on the inside of handles—NONE are genuine without this stamp.
Use only genuine Klein's. They are the product of years of experience and have stood the test of time.
MATHIAS KLEIN & SONS - CHICAGO, ILL.

OPPORTUNITY
Think of the hundreds of millions of dollars that are paid out every week in salaries! Think of the billions that are being spent for the erection of office buildings, modern factories, subways and canals! Think how much it would mean to you to become the directing force behind one of these vast enterprises! How well are you equipped to make a **showing** in competition with your fellows? Is there any one thing in which you excel? Can you plan a big business campaign? Are you a master of finance? What **is** your specialty? You **must** have one to succeed.
So many and varied are the chances that are offered you that you can almost pick out your own occupation. You have means of preparing for a career that in your father's time was not even dreamed of. He had to work at least two hours longer in a day than you do now. He was paid infinitely smaller salary and he had to serve a long, tedious, tiresome apprenticeship for a meager, trifling sum while learning, and then at best he could only learn what his employers chose to teach him. Things are entirely different now. ***The American School of Correspondence will bring the instruction to you.*** If you will only take the two hours a day that your father has turned over to you as an inheritance and use that time to study carefully you can master one of the professions listed below.
We employ no agents to bother you with repeated calls at your home or place of business. We talk to you only by mail. The money you pay us is not used to maintain an expensive organization of high-priced agents, but is used to give you better instruction at a lower cost.
Tell us what course you are most interested in, and receive Free (if you mention Am. Tel. Jour., 5-18-'07) our 200-page hand-book fully describing it.

The Smallest Magneto Telephone

DIMENSIONS.

Width	5 inches
Depth	4 inches
Height	7¼ inches

The Wesco Long Distance Residence Telephone Model No. 51 is the smallest and most compact Magneto Telephone made.

It is especially designed for use in residences where wall space is limited and where ornamental design and beauty of finish are as essential as the efficiency of the working parts.

It is equipped with our Standard Receiver, Hook-Switch, Long Distance Solid back Transmitter, 80 ohm ringer and 3-bar Generator, each part being the best that money can buy. It is also made with 4-bar Bridging Generator with 1,000, 1,600 and 2,000 ohm ringer movement.

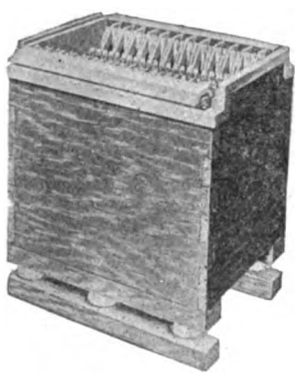
The Success of the Storage Battery



in replacing gravity and other forms of primary cells in the modern telephone exchange has been due to three factors:

Savings in space.
Savings in care and inspection.
Savings in maintenance costs.

The illustration shows a complete Gould cell assembled in lead-lined hardwood tank adapted for large exchanges where batteries of high capacity are required.

It will pay you to investigate the advantages of the Gould Battery over all other Storage Batteries. Full particulars upon request.

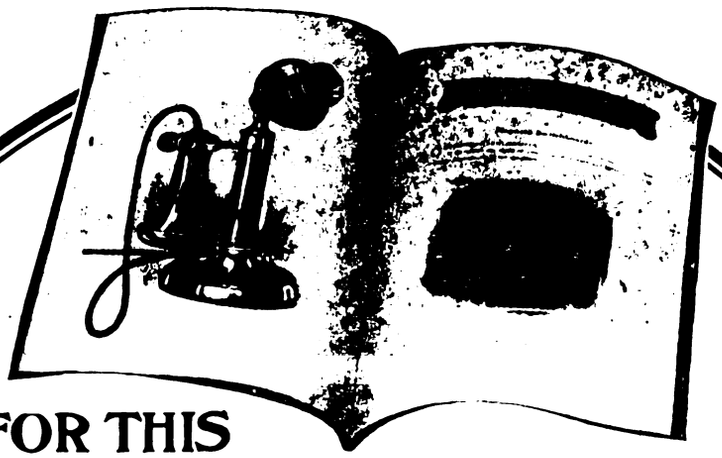
DEAN TELEPHONE APPARATUS



SEND FOR THIS FREE DEAN BULLETIN

Dean Bulletin No. 104B on magneto equipment has just been received from the press. This bulletin is practically a telephone text book printed on heavy book paper containing one hundred sixteen 8x10 in. pages.

It is the most complete bulletin yet issued, showing diagrams of circuits and describing in detail our Magneto Type Switchboards and exchange systems.

Interesting and instructive reading explains the new Dean System of HARMONIC SELECTIVE RINGING ON PARTY LINES USED IN CONNECTION WITH SMALL MAGNETO EXCHANGES.

Useful information on switchboard installing, and maintenance work, is gone into thoroughly.

We will cheerfully mail a copy of this bulletin (No. 104B) free to you. Write us enclosing business card or request on your company stationery.

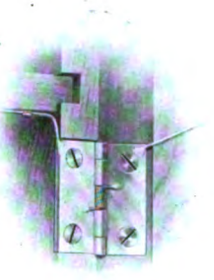
"STROMBERG-CARLSON"

Compact Type and "Central Energy" Style

BRIDGING TELEPHONES

The best telephone apparatus mounted in a well designed and properly finished cabinet is "Stromberg-Carlson" construction. The specifications for woodwork demand a thoroughly finished cabinet inside and outside, assembled to conform with dimensions given to make a compact instrument.



Soldered Connections

The distinctive appearance of our Bridging Telephones is characteristic of "Stromberg-Carlson" Quality Apparatus.

Door Fastening, Shelf Fastening, Generator and Battery Binding Post

The hardware and metal trimmings used are of the best quality. We watch and pass through for inspection all parts that constitute these telephones. The accompanying illustrations show clearly our careful construction in detail, which is essential in Quality Apparatus.

"Stromberg-Carlson" Bridging Telephones give satisfaction. Write either office for latest prices and terms to-day—NOW.

TELEPHONE APPARATUS

ALL KELLOGG TELEPHONE PARTS

Are Made From the Best Grades of Material and Are Carefully Assembled by Skilled Workmen, Thus Making Everything High-Grade Throughout

Kellogg Portable Desk Telephone,
For Central Battery or Magneto Use.

The tubular hard-rubber covered standard, with hollow brass shell, nickel plated base, is distinctively KELLOGG.

The transmitter hinges at top of standard, and there is mounted in base the hook switch and hard-rubber terminal block for receiver and desk stand cords.

The hook switch is of the toggle joint type, having a long motion of the springs, thus obtaining most excellent contacts with only a minimum motion of hook.

All necessary parts are properly insulated, are easy of access and everything is made as nearly dust proof as possible.

Mountain State Electric Co.
Wheeling, W. Va.

Gentlemen:

We enclose our draft for $24.00 to cover Inv. 10-31-'06. It was some time before we could get telephones wired for this lock-out, and then it was some time before we could get our man to put them in, and then we have taken time to test them out to our satisfaction, therefore time has passed. We are now fully satisfied, and they come fully up to all that is claimed for them, now we want to try more.

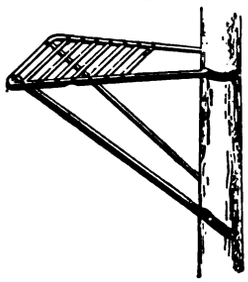
You may send us by Wells-Fargo Express Co. 25-Poole Lock-out.

With Kellogg, Dean or any other good four-party selective ringing apparatus will make it complete and solve the *Party Line* problem.

Our business this season has been exceedingly heavy, and we have been forced to let some things suffer for want of attention.

Yours truly,
WEST TEXAS TELEPHONE CO.
By C. H. Woodward, Sec. & Treas.

Security Pole Seats ARE Secure



And more than that--they're neat in appearance--cost very little--and never break, split, crack or warp.

The Security is very light--can be easily, instantly installed--and we repeat--it costs very little.

You should write for the Security Book. It gives prices and particulars.

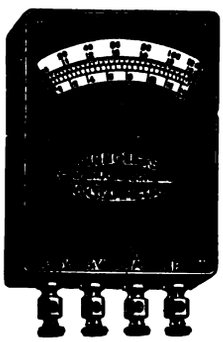
LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

Do you want the best wire to be obtained for Telephone Service?

Use Roebling Hard Drawn Copper Wire

Do you want a cheaper wire which will last for years and give good service on lines of ordinary length?

THE WHOLE SECRET

of the success of the AUTOMATIC TELEPHONE SYSTEM lies in the elimination of the girl operators. It cannot be denied that most of the troubles and much of the expense in the manual system (where operators are used) can be charged to the operators themselves.

TRUE ENOUGH,

all operators are not faulty all the time, but some of them are at all times and all of them are sometimes. But "a chain is no stronger than its weakest link," and the average telephone subscriber judges the entire service by the poorest he has received.

IN THE AUTOMATIC TELEPHONE SYSTEM

the fallible human operator has been displaced by an infallible machine, a machine that produces perfect telephone service. With the human operator disappear her faults and her expense. The former are many, the latter not inconsiderable.

THAT IS WHY

the AUTOMATIC TELEPHONE SYSTEM, having no operators, can produce a perfect telephone service, prompt, accurate, absolutely secret, at a much lower cost than for inferior manual service. That is why it is a profitable investment to put your money into an operating company that uses the Automatic Telephone System. Our Automatic Telephone System has been adopted in the following cities:

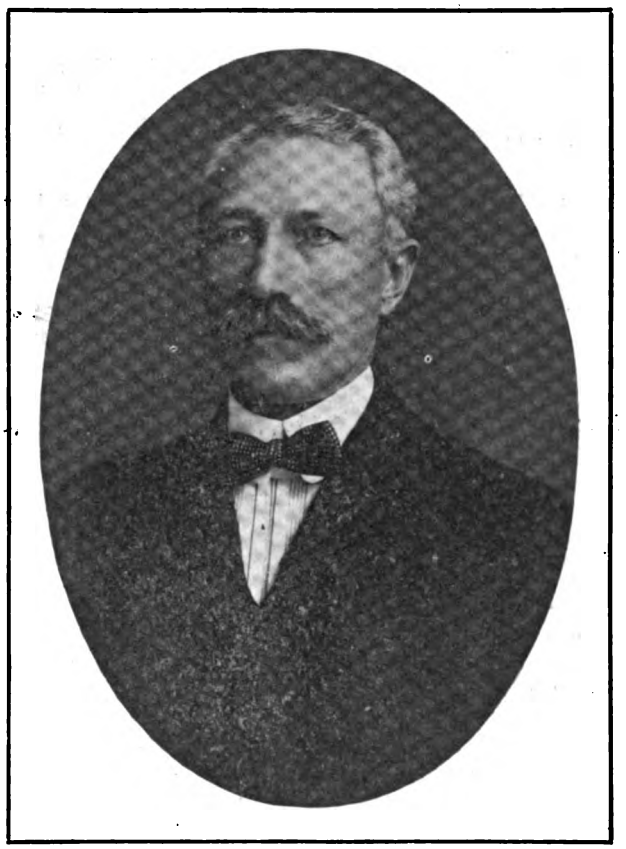
The Indiana Telephone Convention

By R. D. FISHER.

WITH an attendance of 308 all told, 268 of whom were delegates, and the most elaborate and pretentious exhibit and display of modern telephone and electric apparatus by the manufacturers and supply houses ever shown in the State, the second annual convention of the Indiana Independent Association was called to order May 15 by President A. C. Lindemuth, of Richmond. After calling the roll of district representatives President Lindemuth introduced Mayor Charles A. Bookwalter, who welcomed the telephone men to the city in a very felicitous manner. He said it was scarcely necessary to assure telephone men of his pleasure at their presence in a city to whose greatness they contributed so largely. He said telephones are no longer a luxury but a genuine necessity and few people stop to realize how much the community owes to the enterprising telephone men or with what rapidity the telephone development has come upon the people. President Lindemuth responded to the welcome of Mayor Bookwalter in a few well chosen words.



A. C. Lindemuth, Reelected President of the Indiana Independent Telephone Association.

Mr. E. M. Popp, of Fort Wayne, was made principal secretary of the convention.

President Lindemuth presented his annual address and was listened to with marked attention. He said "he congratulated the association on the unusually large representation present. These meetings are not only instructive and beneficial from a financial standpoint, but they make us broader and better business men. They extend our acquaintance, enlarge our experience and develop the social qualities among men engaged in the same line of work." He referred to the telephone business as a strenuous calling which has many daily worries and difficulties which call for all the Beatitudes and Christian graces combined. Nothing short of the temperament of an angel, the patience of Job and the genius of an Edison are adequate to carry one through a day's telephone experience with entire satisfaction to himself or the public. Mr. Lindemuth spoke of the elaborate exhibits as a feature of the convention not only commendable for the enterprise shown by the exhibitors, but as a means of giving valuable education to the visitors. Their importance is fully appreciated because they afford the opportunity to see the most up-to-date and most improved apparatus and equipments without trouble and expense.

The record for the year was referred to as follows: "The progress of the Independent telephone interests in Indiana has been both steady and important. There has been an onward march in solid phalanx toward the firmer and more complete occupation of the telephone field of the State. Many new companies have organized, new plants have been established and many of the older companies have erected substantial and well equipped buildings, installed many miles of underground cables, and re-equipped their central offices with the latest and most improved apparatus. Other companies are preparing to make similar improvements, while almost every Independent company in the State has extended its territory, rebuilt, improved and strengthened its lines and bettered its service. The progress of the Independent telephone movement in the State during the year has been pre-eminently satisfactory. We are greater and stronger than ever before. No defection into the ranks of the Bell worth mentioning have occurred. On the contrary numerous companies that had a taste of the beauties of the Bell sublicense experience have cut loose and returned to the strictly Independent relation." Mr. Lindemuth said this fact is remarkable considering the persistent and expensive efforts put forth by the many Bell representatives sent out during the year. "It is safe to say that every Independent company in the State has been approached by Bell representatives during the year—some once and others many times. The meagre success speaks volumes for the wisdom and loyalty of the Indiana Independents," said he.

"Twenty-seven additional companies have joined the State Association during the year. This increase is certainly very gratifying. At this rate in a few years every Independent company in the State will be joined in a compact organization easily able to protect itself and shield the public from the encroachments of unscrupulous competition. There are 182,000 Independent telephones in use in the State, while the Bell and sub-licensee telephones in the State number only 45,000. The value of Independent property in the State as shown by the returns to the State Tax Board is $20,000,000 and the gross income is reliably estimated at $3,280,164."

Digitized by Google

Mr. Lindemuth referred to the acts of desperation and the useless expenditure of enormous sums of money and the dissemination of tons of false literature on the part of the Bell companies to check the growth of the Independents and the final offer to surrender the exchange field in Indiana, Ohio and Michigan, as showing the incorrectness of the words of President Fish, who recently stated that the Independents had made no relative gain.

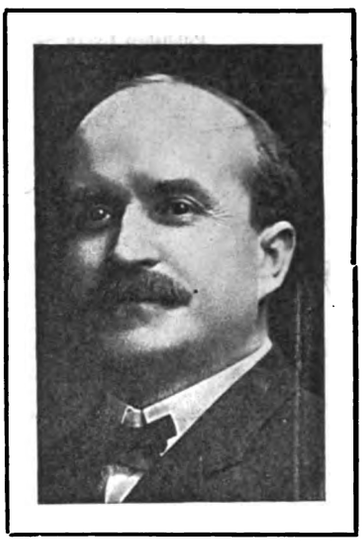
E. M. Kopp, who acted as Secretary at the Indiana Convention.

"The future policy of the Independents is plain and their ultimate success absolutely assured. The prejudice which has grown up against the opposition is wholly justified. The Independents have succeeded because they deserved to succeed. But to make that success permanent two things must be regarded. First, the people must not forget their benefactors and by restrictive and unwise legislation reduce the rates for service below that which is commensurate with the greatly increased service and the high price of labor and material; second, as the Independent companies grow large and strong they must not become unmindful of the rights of the public."

President Lindemuth commended very highly the services of Mr. C. S. Norton, secretary, the members of the executive committee and the district vice-presidents for valuable aid and services during the year.

President Lindemuth's address was received with hearty approval and applause. The showing was so good that it put the convention in an enthusiastic mood in the very beginning.

The secretary-treasurer of the Association, C. S. Norton, presented a report which showed that very effective work has been done during the year and that the Association is in a most prosperous condition. "Every obligation has been met promptly and still a good balance remains in the treasury," said he. Mr. Norton's report shows that there have been no withdrawals during the year, but on the other hand, the membership has been increased 25 per cent. The report concludes with the declaration that the Independent companies and the Independent sentiment are stronger in the State than ever before. The secretary stated that certain propositions have been made by the field agents of the Bell company looking toward a unification of the telephone interests in Indiana, but as these propositions have not been made by the officials of that corporation, the Association officials have given them but little attention, and at no time has the executive committee considered them of sufficient importance to demand action on the part of the Association.



Wm. L. Moellering, Re-elected Member of Executive Committee.

The applications of twenty-seven companies seeking membership in the Association were read and were about to be accepted when the eligibility of some of the companies was questioned, necessitating the reference of the applications to a committee. It was intimated that a few of the companies making applications were connected up with the Bell lines. The committee, however, subsequently reported that all of the applicants were eligible and they were accordingly accepted.

Unusual interest was shown in the reports from the district vice-presidents. There are eleven districts in the State and in every instance the reports showed large gains in the number

Annual Convention of the Illinois Independent Telephone Association

THE Illinois Independent Telephone Association held its second annual meeting at Springfield, on May 14 and 15. The meeting was largely attended, about 150 officials, managers and operators of the Independent telephone companies of the state being present, among the number being about forty lady chief operators. The meeting was characterized by the harmony which pervaded the sessions, and by the absence of any bitterness shown by the speakers toward the Bell Telephone company, though they at the same time announced their determination to fight that company in a business way and to enter into no agreements regarding exchange of service. A number of interesting papers were read at the sessions, and on the evening of the first day the local committee tendered the visitors a theatre party at Chatterton's opera house, to witness the entertainment by Billy Link's Vaudeville Company.

An interesting feature of the convention was the school for instruction of operators, conducted by Miss T. Barnes, chief operator of the local company of the Inter-State Independent Telephone and Telegraph Company.

Edward R. Conklin, of Aurora, the president of the association, was unable to be present at the convention, and W. H. Bassett, of St. Louis, Mo., a member of the executive committee, presided at the morning session on Tuesday, and Manford Savage, of Champaign, Ill., at the afternoon session that day and the morning session on Wednesday, being succeeded at the afternoon session by Mr. Bassett, the newly elected vice-president. The other officers, with the exception of Mr. Conklin, were present.

The Tuesday morning session was spent in the appointment of committees and preliminary work. C. B. Cheadle, of Joliet, secretary of the association, when a motion was made by J. S. Dailey of Clinton that a committee be appointed to select questions for the "question box," rose and stated that he had prepared a list of fifty questions and had sent letters to eighty-three members of the association assigning to them questions which they were to take, in some cases two persons being assigned to the discussion of one question.

Secretary Cheadle read an invitation from the Chicago Commercial Association, inviting the association to hold its next annual meeting in that city. The communication was referred to the executive committee with power to act.

Mayor Griffith in his address of welcome claimed that Springfield was the best convention city in the state of Illinois. Competition in telephone business is a good thing the mayor believes. He said in his address at the convention that it helps reduce rates and is a means of securing better service for the patrons of the two or more lines in competition.

On behalf of the association, Vice-President Savage of Cham-

Digitized by Google

paign thanked the mayor for the address of welcome. Reports of the officers of the association which were read during this session, showed that most satisfactory conditions have prevailed during the past year.

Colonel J. H. Hackett of Jacksonville was the first on the afternoon programme in the matter of reading a paper before the convention. His topic was "The Past and Present Conditions of the Telephone Business." He spoke of the rates being maintained and in some cases increased in the country.

Manford Savage, President of the Illinois Association.

The next speaker of the afternoon was J. S. Dailey of Chillicothe, and his address was entitled, "The Fallacy of Free Exchange and Cheap Switching." His address in part is as follows:

"Free exchange is parsimony rather than economy; it is 'robbing Peter to pay Paul.' A commercial axiom is, that in getting something for nothing, some party to the transaction must suffer a loss.

"One aspect of the situation is, where an each-one-owns-his-own-sort of a happen such, not built for profit, and go to the dogs when it is worn out, exchange, or rather switching center, is adjacent to a city exchange, where an up-to-the-minute system is built and operated by business men who expect to derive a fair return from their investment, and free exchange is demanded by their cheap-service neighbors. It does not require any argument to show the injustice done the up-to-date- exchange. Not only does the element of maintenance cost enter into the connecting link, but the congestion of its local lines with free transit of silly gossip from a neighboring exchange, retarding the service due its own subscribers and reducing the relative efficiency of its system.

"Cheap switching encourages cheap construction—the root of poor service. In this age intelligence demands a higher wage scale than the physical efforts of a human machine. Yet, however, it is essential to have the best combination of intelligence and skill at the switchboard in order to obtain the best results. Such a combination demands just remuneration, the payment of which commands adequate switching fees."

C. S. Haukins, Re-elected Treasurer of the Illinois Independent Telephone Association.

In the afternoon, commencing at 4 o'clock, Miss T. Barnes, chief operator of the Springfield office of the Inter-State Telephone Company, gave a school of instruction for the operators of the Independent systems who attended the convention. Miss Barnes has the reputation of being the best informed chief operator in the State and she was eagerly followed throughout her half hour's demonstration.

In the evening a theatre party was given by the association in honor of the visiting delegates. The party occupied the greater part of the first floor of the opera house.

In the evening, at the Hotel Silas, a stereopticon lecture was delivered by J. H. Shoemaker, of Waterloo, Iowa.

The morning session of the second day opened with Manford Savage, vice-president, presiding. The paper read by Miss T. Barnes, chief operator of the local Inter-State Telephone Company, was the first number on the programme, after the procedure had been greatly altered. Her paper was on "Exchange Operating."

Miss Barnes held the attention of every one of the 250 delegates and guests who were in the room at the time she took the floor.

George H. Glass of Pekin spoke on the topic "The Manager; His Duty to Patrons and Employees." He described the ideal manager as a gentleman, honest, generous, brave, wise, of lofty and noble aims, always with a smile, and a man of parts. He must be able to talk entertainingly on all subjects and at any time and with anybody. He must set a good example for his employees by paying his bills promptly. In fact, the manager of a modern telephone plant must be one posted on everything and know everything.

A discussion on "Operating Methods and Building and Handling of Switchboards" was to have been led by John F. Casey, but on account of his absence the paper was read by A. J. Shands of St. Louis, Mo. The paper dealt entirely with the observation desk, a feature new to most exchanges.

The afternoon session convened at 1:15 o'clock in the usual place, with William H. Bassett of St. Louis presiding. The afternoon was spent, for the fore part, in the discussion of the paper, "The Scrap Book," read by B. F. Wasson of Clinton. It was along the line of saving important items from newspapers and technical magazines. The discussion lasted for half an hour on this paper and was very beneficial to the greater number of delegates from the smaller exchanges, who agreed as to its inestimable value.

C. B. Cheadle, Re-elected Secretary.

The following resolution was adopted by the convention:

"Resolved, That it is the sense of this convention that the growing tendency of permitting the Bell Telephone company to connect their toll wires with Independent switchboards is a practice we believe detrimental to Independent telephony, and should not be countenanced by this association."

A committee to establish toll rates between the various companies was named by the acting president, and is composed of James W. Barrett of Pekin, L. A. Herrick of Freeport, and Edward D. Glandon of Pittsfield. A uniform scale will be adopted and the report of the committee will be made in the near future.

Manford Savage of Champaign was elected president of the association. William H. Bassett of St. Louis was placed in nomination for the vice-presidency by George H. Glass, of Pekin,

The Telephone Wire Plant*—Continued

By S. P. Grace, Chief Engineer C. D. & P. Tel. Co.

In such a system of distribution as has been outlined, there will, of course, be many streets and districts where for the present time aerial cable is not warranted. If these districts are in the neighborhood of an aerial cable base line, and the subscribers are not located more than 1,000 feet away from the cable line, it is economy to connect them with twisted, pair wire strung on distributing brackets rather than to resort to the use of bare wire and cross-arms, where perhaps a large part of the arm capacity will lie idle for several years. This method of wiring is shown in Fig. 12. If the side streets are clear of trees and it appears probable that many of the circuits will be more than 1,000 feet long, the distribution should be made by means of bare wire on cross-arms, as shown in Fig. 20. Generally speaking, the bare wire on these side lines should be of copper, for at the present time with so much sulphurous smoke in the atmosphere of our cities and towns, the life of iron wire is too short to give the wire serious consideration. Copper wire smaller than

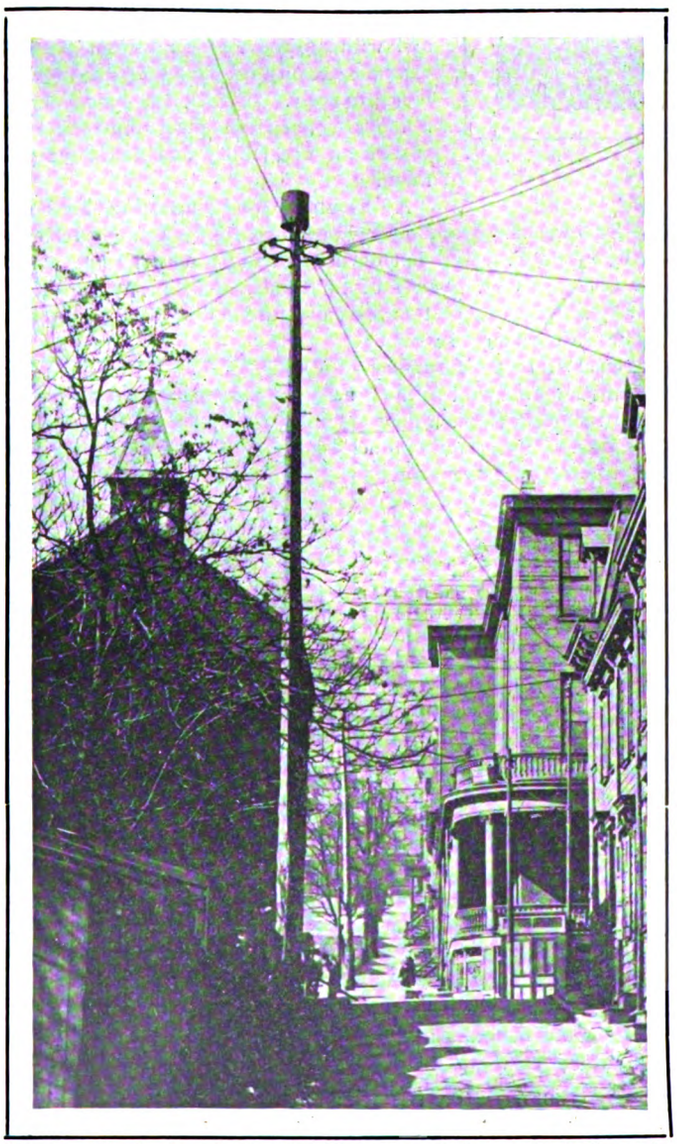

Fig. 13. Distribution of subscribers' lines from circle top distributing pole.

No. 14 N. B. S. or No. 12 B. & S. gauge cannot safely be used in spans because of its low tensile strength. This size of wire is not required for conductivity, since in the places where this wire is usually strung we would be satisfied with a cable conductor of 19 or 22 gauge. Here again it also seems possible to make considerable saving by the use of copper-clad steel wire. A No. 14 B. & S. or No. 16 N. B. S. copper-clad wire is sufficiently strong mechanically and has

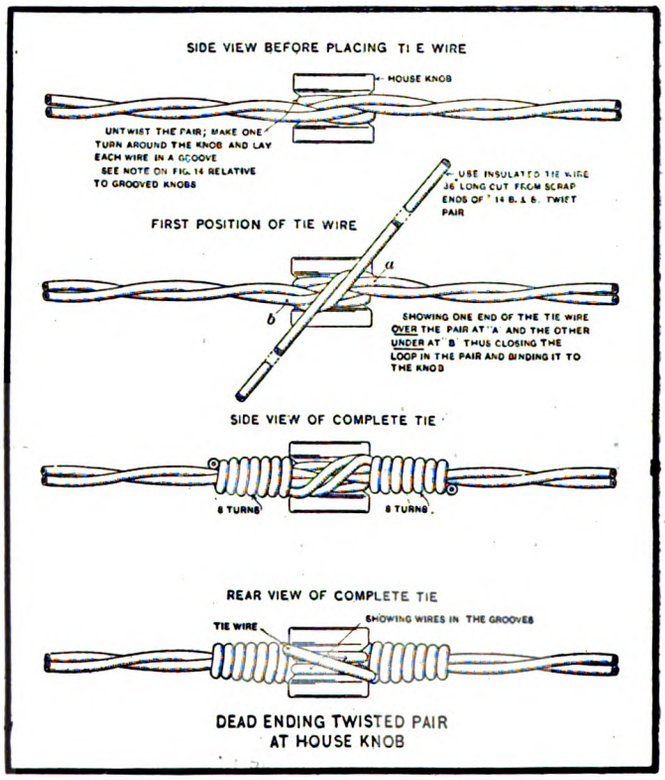

Fig. 14. Method of tying twisted pair insulated wires to porcelain knobs.

a conductivity equivalent to a 19-gauge cable pair. This will reduce the first cost of line wire about one-half. The copper-clad wire will be just as durable as copper, and since its strength lies on the inside rather than in the hardened outside shell, it will be subject to a lesser number of breaks and besides it can be taken down and used in other places. It is usually necessary to scrap copper wire when taken down, for, as a rule, it will not stand re-stringing in another location without causing much trouble from breaking, due to nicked and scratched spots.

When the open-wire subscribers' circuits fills several cross-arms, it is generally economical to replace them with a cable. From studies which we have made it has been found that when a cable is placed on a lead of this character, it is economy to remove the open wires and cross-arms and returne them to stock rather than attempt to use them for distribution from taps placed one to two blocks apart on the cable. The removing of open wires when the cable is placed cleans up the line in good shape, makes it easy to maintain, and far more sightly to the public. It would seem that the aerial cable system of distribution of telephone lines is the most ideal system now known for districts where for the present conduits are not justified. Practically all the large telephone companies have realized the economies to be obtained by its use, and during the last three years thousands of miles of this kind of cable distribution have been placed.

Since the wire plant requires the major portion of the money expended for a telephone system, and since there are so many varied and complex factors entering into its design, the greatest care should be given to its engineering.

*Abstract from paper presented at the 128th meeting of the American Institute of Electrical Engineers, April 26, 1907.

Digitized by Google

The most important problems in connection with the wire plant are:

1. The development plans which must be carefully worked out by the engineer so that not only the first cost of the plant will be a minimum, but so that the plant can take care of increases in business from time to time without unnecessarily large expenditures for redesign and reconstruction.

2. The transmission must be carefully studied so that there will be a good volume of talk between any two connected subscribers. The circuits, whether in cable or in open wire, should be graded, and if necessary loaded so that

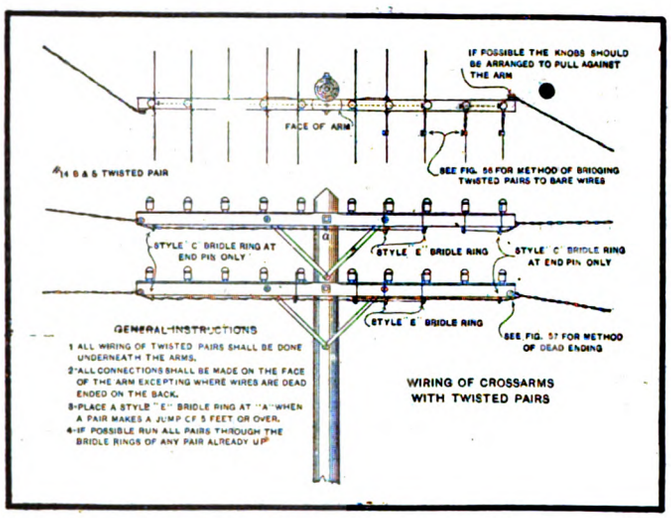

Fig. 15.—Distribution of subscribers' lines by means of open wire on cross arms. Twisted pair drops to subscribers' premises.

while the transmission is sufficiently good it will not be given over unnecessarily expensive trunk lines.

3. The underground system must be extended as rapidly as it is economical to do so, and direct terminal or interior block connections made with the maximum number of subscribers.

4. In the outlying districts where pole lines will still be resorted to, every effort must be made so to design and construct these lines as to have them of low first cost and annual charges. They must be but slightly affected by the elements and free from interference from electric light and power circuits. These aerial systems must be made sightly to avoid the criticisms of the public.

5. The engineer must constantly seek for new and improved types of material and construction methods to be used in the wire plant, so that the first cost and maintenance can be reduced.

ANNUAL CONVENTION OF THE ILLINOIS INDEPENDENT TELEPHONE ASSOCIATION.

(*Continued from page 337.*)

and his name was accepted as that of the next vice-president. The election of Charles B. Cheadle of Joliet as secretary of the association was the signal for a great demonstration in his honor. He had long been classed as a hard worker in the interest of independence and was easily the favorite for re-election. C. S. Hankins of Decatur was re-elected treasurer of the association.

The executive committee composed of E. R. Conklin of Aurora, C. B. Cheadle of Joliet, C. S. Hankins of Decatur, W. H. Bassett of St. Louis, Mo., C. O. White of Princeton, Manford Savage of Champaign, and J. W. Barrett of Pekin, was re-elected man for man. There was but one change in the list of vice-presidents of the association. In the eighth district G. L. Chapman of Tuscola was elected to succeed C. W. Shimley of Casey. The vice-presidents of the association now stand: First district, A. J. Vernier, Kankakee; Second district, Frank Zinnell, Savannah; Third district, F. M. Ashe, Kewanee; Fourth district, B. F. Wasson, Clinton; Fifth district, J. S. Dailey, Chillicothe; Sixth district, W. J. McQuiston, Monmouth; Seventh district, W. H. Ramsey, Auburn; Eighth district, G. L. Chapman, Tuscola; Ninth district, W. H. Bassett, St. Louis, Mo.; Tenth district, Hon. C. E. Hull, Salem; Eleventh district, H. R. Aisthorpe, Cairo.

The matter of selecting a city for the third annual convention is in the hands of the executive committee, and they will not report until about a month or so before the next convention. Springfield, Pekin and Chicago are in the field for the honor. Each has its adherents, but the fight is most likely to be between Pekin and Springfield.

DEATH OF CHARLES F. CUTLER

CHARLES F. CUTLER, President of the New York Telephone Company, died suddenly of heart disease at Saranac Inn, Saranac Lake, on Saturday, May 18th.

Mr. Cutler was born in Ashland, Mass., in 1841. He began business as a young man in South Framingham, Mass., as a commission merchant, later becoming interested in the telephone business in South Framingham. Later he went to Brooklyn, where he formed The New York & New Jersey Telephone Company, of which he was made president.

He then went to New York City and joined the Metropolitan Telephone & Telegraph Company, afterward the New York Telephone Company. At the time of his death he was president of the New York Telephone Company and chairman of the Board of Directors of these companies: The New York & New Jersey Telephone Company, the Bell Telephone Company of Philadelphia, the Delaware & Atlantic Telegraph & Telephone Company, the Chesapeake & Potomac Telephone Company, the Hudson River Telephone Company, the Central New York Telephone & Telegraph Company, the Empire State Telephone & Telegraph Company, and the New York & Pennsylvania Telephone & Telegraph Company. He was also connected with several banks and banking institutions, and a member of the following clubs: Metropolitan, Riding, New York Athletic, Lawyers, Morristown, Whippany River, Morris County Golf Club, and the Morristown Field Club. He was known all over the United States as a man of unusual business ability and probably did more than any other one man to develop the telephone interests with which he was connected.

CHIEF OPERATORS AS BUSINESS PRODUCERS.

PERHAPS of all the plans which have been tried by Independent telephone companies for getting their subscribers to use new Independent toll lines none is more valuable than that of direct conversation between the chief operator of the telephone company and the subscriber. Wherever this idea has been put in practice the chief operator calls up the subscriber, and, after perhaps making some general inquiry about the service, in order to see whether it is satisfactory, and to put the subscriber in a good humor, takes up the question of toll calls.

After telling the subscriber what lines can be put at his service, the chief operator may endeavor to find out the names of the persons called up by that particular firm in several cities which may be reached by the company's toll lines, and possibly have a connection put up immediately if the subscriber has never used an Independent toll line to the points mentioned. A single convincing example is worth more than hours of general soliciting.

One of the principal advantages over an outside man which the chief operator has in bringing toll business to the attention of subscribers is her perfect familiarity with the service, and her ability to see that the man gets a good start when he first uses the lines. If a solicitor highly recommends toll service to certain points, and a man calls up a subscriber at a distant place and receives a noisy connection, is cut off, or finds some other difficulty, he is extremely likely to set the solicitor's remarks down to excessive zeal in the desire to obtain business. The solicitor is recognized as a business getter, and his statements are likely to be discounted to a certain extent by business men. On the other hand, the chief operator, if she is alive to possibilities open to her in this line, will not permit the subscriber to feel that she is taking too strong an interest in increasing the amount of toll charges which he pays to the telephone company, but that her efforts are conducted more especially from a service standpoint. She assumes that the subscriber is doing a certain amount of toll business, and that he desires to do more if he can obtain satisfactory connections. Her statements are rather the expressions of personal interest which she takes in the quality of the service, for which she is responsible, and being received as such carry additional weight when backed up by good results in an actual conversation.

CONDITIONS IN TELEPHONE LINE DISTRIBUTION.

SOME extremely valuable points are brought out in Mr. Grace's Institute paper on the Telephone Wire Plant, which is concluded upon another page in this issue. It is noteworthy that the large relative cost of the outside wire plant makes the class of engineering referred to one which is highly productive of economy to the telephone company, and therefore broadly distinguished from other branches which have for their object the effecting of improvements in the efficiency of the service rendered to the subscriber.

The studies described in the paper referred to have been so carefully worked out that they have resulted in the introduction of apparatus and methods which are believed to thoroughly satisfy many requirements of distribution in a number of important cities where they have been at least partially adopted. The junction box possesses advantages which come from the economy with which it may be constructed and installed, and also certain other points which make for economy in a less direct manner. For example it lends itself very readily to a plan of distribution which is far more sightly than older methods, and so undoubtedly will make it easier for a company to obtain rights of way over certain classes of property. Then, too, its construction is so simple that by proper tagging of the wires there is little opportunity for even the most incompetent inspector to leave a box in poor condition.

A general conclusion which is especially worthy of attention is that relating to the idea of installing many small terminals, and making open wire leads to the substation as short as possible. Mr. Grace makes his statement on this point very emphatic and will no doubt be agreed with by many of the most prominent engineers throughout the country. It will be especially interesting to watch the extent to which this type of distribution is carried, and various methods adopted, during the next two or three years.

PLANNING FOR GROWTH.

IN spite of all that has been said about the great losses incurred by underestimating the rate of growth of the telephone business, there are still many companies starting to operate new plants, or undertaking reconstruction work, without adequate provision for future increase. Perhaps the greater amount of attention which has lately been devoted to cable distribution has resulted in somewhat better conditions in the outside plant than prevailed two or three years ago, but even yet the main considerations which apply to central office growth are not given their full value in a very large percentage of cases.

When a new plant is located the first consideration should be to place it on a lot extending beyond the walls of the building sufficiently to allow of the extension of the telephone plant to a full reasonable ultimate capacity, without the purchase of additional property at a time when the interests of the telephone company may make it necessary to pay a premium above the proper value. The question of expansion within the building requires very careful estimating. The thing to be borne in mind is rather that the question is one of relative proportions of space required for different classes of work performed at various periods of the growth of the company. These relations should be carefully worked out, and the space laid out so that correct proportions in all departments may be attained at the time the switchboard is filled to its ultimate capacity. When getting figures based on an ultimate addition to a building constructed of comparatively small size, to be extended later, the problem becomes especially complicated, but its difficulty does not in any way relieve the management of the necessity of its solution.

In the laying out of apparatus itself it is essential to plan a switchboard lay-out to give good natural lighting to all the positions and permit supervision by the chief operator, not only for the initial installation and immediate future, but for all the various sizes of switchboard which may be installed up to and including the ultimate. The underground cable entrance and frames used for the terminal and auxiliary apparatus need to be all laid out on the floor, and to have such racking as is required for cable placed in such a manner that the frames can be extended to correspond to the growth of the switchboard without any crowding, relocating of apparatus or cutting of cables. It is true that building for the greatest ultimate convenience in these respects involves at first considerable charges on unoccupied space, but it is hardly probable that the time has yet come for the business to cease to grow at a rate so fast that these charges as they accumulate will be far less than the expense of rebuilding the central office at a later date.

THE TELEPHONE IN THE COURTS

CONDUCTED BY A. H. MCMILLAN.

Readers are invited to submit questions on any point of Telephone Law. They will be answered and explained on this page.

A BINDING CONTRACT.

Please inform me if, in your judgment, the enclosed contract is binding if signed as indicated. We have such a contract with a telephone company and just at this time would like to know if it is binding under the laws of this State. J. K.

The contract purports to be between two telephone companies, the party of the first part agreeing to give without cost to the stockholders of the party of the second part, members of their families or visitors, the free use of first party's lines for ten years; except that in case a stockholder of the party of the second part allows any person not included in the clauses above mentioned, the free use of the lines, and such party refuses to pay the tolls, such stockholder of the party of the second part shall be denied the further use of the lines until the tolls are paid. It is also agreed that if either company passes into the control of an incorporated company the agreement is to be null and void. The agreements are signed and sealed by the presidents and secretaries of the companies mentioned.

IN the opinion of the editor, the contract referred to is valid and binding according to the laws of Pennsylvania. The minds of the parties have met upon what they wish their contract to be, and the proper officers of each company have executed it in proper form. The provisions of the contract are such as might lawfully be made, and no reason is seen why the contract should not be held good. This is, of course, upon the presumption that the presidents and secretaries of the companies had proper authority to execute it for the members thereof.

TEN CENTS PER POLE HELD REASONABLE TAX.

JUDGE SCOTT, at Easton, Pa., handed down an opinion which is of great importance in that State. In 1905 the legislature passed an act which permitted telephone, telegraph and electric light companies to appeal to the court of common pleas to fix the amount which they were to pay annually as a license fee on poles and wires.

The Pennsylvania Telephone Company filed its petition, under this act, against the borough of South Bethelem. The borough filed an answer and contended that the act of assembly was unconstitutional. The court, however, held this objection to be unfounded. The court of common pleas of Bucks County fixed the amount at five cents a pole. The court of common pleas of Cumberland County fixed the amount at ten cents per pole. The court of Allentown follows the latter court, and fixes the amount to be paid by the Pennsylvania Telephone Company to the borough of South Bethlehem at ten cents a pole.

The South Bethlehem ordinance fixed the annual tax at $1 per pole for all poles within the corporate limits, and besides lays a tax of $5 per mile on wires strung. These taxes will not be valid under this ruling.

CONSTRUCTION OF WORDS IN FRANCHISES.

IN a franchise giving an electric company the right to "erect and maintain poles, trolley, feed and stay wires and other devices for conducting electricity in, over and under the streets, highways, bridges and town ways, in any of said cities and towns wherein it has been or may hereafter be authorized by the board of aldermen or selectmen to operate," the court considered the construction of the word "wherein," which might refer to either the words "in any of said cities and towns" or to "streets, highways, bridges and town ways." The plaintiff, who was seeking to enjoin the company from maintaining poles and wires in one of the streets of Taunton, Mass., and to compel the removal of poles and wires that had been erected there by the company, contended that it related to the latter phrase, while the company contended that it referred to the former. The plaintiff's contention, if sustained, would restrict the erection of poles to these streets on which it had previously been authorized by the municipal authorities to build its line. The adoption of the defendant's contention would permit it to build anywhere in the State. The court held it to be a general rule that a limiting or qualifying word or clause must be confined to the last antecedent unless the subject matter requires a different construction. The word "wherein" is not a word, said the court, that naturally would be chosen to relate to bridges, while it is strictly correct as referring to cities and towns. So it was held that the word "wherein" related to the words "any city or town" and included all parts of such cities or towns, so the electric company might build anywhere within the limits of the said town. Williams vs. Old Colony Street Railway Co., 79 N. E., 484.

TRANSMITTING MESSAGES IMPARTIALLY FROM PAY STATIONS.

THE Supreme Court of New York has decided the case of Gifford vs. Glen Telephone Company to recover $100 damages for an alleged violation of the transportation corporation's law relating to the failure of a telephone company to transmit messages with impartiality and in good faith. Gifford alleged that he went to the company's pay station for the purpose of using the telephone. The instrument in use was the ordinary wall telephone with a metallic box attached to it, into which the party using the telephone was directed by printed instructions to drop the toll money. The box contained express instructions that no money should be deposited therein until the customer was told to do so by the operator, after taking down the receiver. The plaintiff dropped his money into the box without waiting for such directions, and after calling up the operator and being told to deposit his money, said that he had already done so. The operator replied that she had not heard it drop, because the receiver was on the hook and she was shut off from the instrument. The money box had no electric connection with the telephone, and the only means that the operator had of knowing that the money had been deposited was by hearing a bell ring a certain number of times for each toll charge. She told Mr. Gifford that if he would deposit his money she would place him in communication with the party he desired to talk with, and if he paid twice the overcharge would be returned to him. This he refused to do, and brought suit.

The decision of the court was in favor of the telephone company. The Court was of the opinion that if every fact as claimed by the plaintiff was found in his favor, nevertheless he would not be entitled to recover. It was their opinion that the statute imposes the penalty not for an error of judgment of one of the company's operators, a defective instrument or a misunderstanding as to whether a required charge for a message has been paid, but solely for the refusal to transmit dispatches with impartiality, good faith and in the order of their reception after payment of the usual charges as established by rules and regulations of such corporation.

Gifford vs. Glen Telephone Co., N. Y.

THE INDIANA TELEPHONE CONVENTION.

(*Continued from page 336.*)

of subscribers during the year, increased gross receipts, extensive improvements and miles of new extensions. Some of these reports recited troubles and explained how they were overcome, others told of competition and rate cutting, but every report showed a victorious warfare against opposition and a healthy, steady and permanent development. An interesting feature of these reports is the comparative showing of the number of Bell and Independent instruments in use, also the number of each removed during the year. The reports show a large number of Bell instruments removed during the year and that the relative number in use is nearly five to one in favor of the Independents.

Following the reading of the district reports Mr. Frank L. Beam, president of the Ohio Independent Telephone Association, was introduced and addressed the convention briefly.

The banquet given at the Claypool Wednesday night by the Indianapolis Telephone Company and the New Long Distance Telephone Company was one of the largest and most enjoyable occasions of the kind ever held in the State. After a seven course dinner, the Hon. Thos. E. Davidson acting as toastmaster introduced each speaker in a pleasing manner. Among those who spoke briefly were Col. J. D. Powers, of Louisville; James S. Brailey, Jr., of Toledo, O.; D. E. Sapp, of Mt. Vernon, O.; James P. Goodrich, of Winchester; A. L. Têtu, of Indianapolis, and A. J. Payton, of Rockport. Notwithstanding the various topics assigned to each speaker the burden of their remarks dwelt upon the alleged proposition to enter into a working coalition with the Bell company Each of the speakers registered a strenuous objection to such a plan and sounded a warning against a proposition to "tie up" in any manner with the Central Union lines. There was much interest shown and considerable encouragement derived from the speech of Mr. Brailey, president of the Indianapolis Telephone Company and the New Long Distance Telephone Company. Mr. Dwight E. Sapp, of Ohio, spoke with eloquence, and made a happy hit by witty references to Indiana authors, poets and presidential timber. At a late hour the company rose and sang "America."

At the opening of the Thursday morning session a telegram was read from B. G. Hubbel, of Buffalo, N. Y., expressing regrets because of his inability, by reason of illness, to be present and read a paper. Speeches by Theodore Gary and E. B. Fisher were received with enthusiasm.

At this point the convention went into executive session and for three hours a free and animated discussion was had of the alleged tentative proposition of the Bell company, looking to a coalition and division of the exchange and toll line business. The executive committee made a report to the effect that no official proposition had been made and, therefore, there was nothing before the convention for discussion. The discussion, however, arose over the adoption of the committee's report and President Lindemuth thought it advisable to let the members thresh it out. The argument was practically unanimous against considering such a proposition and the vote showed conclusively that the Independents are opposed to any plan or working agreement with the Bell company.

An important amendment was made to the by-laws, providing that hereafter any Independent company that has direct Bell connection shall not be eligible to membership in the Association. The constitution was also amended so that any company now a member of the Association that is found to have formed connections with the Bell system shall forfeit its membership. The election of officers resulted in the selection of the old officers for new terms, as follows: President, A. C. Lindemuth, Richmond; Secretary-treasurer, C. S. Norton, Indianapolis; Executive Committee, A. C. Lindemuth, C. S. Norton, Theodore Thorward, J. W. Weik, Thos. E. Davidson, C. D. Knoefel and W. L. Moellering.

The following delegates were elected to attend the convention of the International Independent Telephone Association in Chicago, June 4, 5 and 6:

W. J. Devol, Lebanon; Thos. E. Davidson, Greensburg; F. S. Shoemaker, Bloomington; A. J. Payton, Rockport; R. F. Faulkner, New Castle; George C. Hitt, C. S. Norton, Indianapolis; Jas. P. Goodrich, Winchester; F. O. Cuppy, Lafayette; Jesse W. Weik, Greencastle; J. E. Yarling, Peru; Theodore Thorwood, South Bend, and F. W. Shirmeyer, Decatur.

DIRECTORY OF EXHIBITORS AT THE INDEPENDENT TELEPHONE CONVENTION.

Room Numbers.	
642	American Electric Fuse Co., Muskegon, Mich.—Protective devices.
134	American Electric Telephone Co., Chicago, Ill.—Switchboards, telephones and parts.
618	American Steel and Wire Co., Chicago, Ill.—Wire and cable.
650	American Sewer Pipe Co., Pittsburgh, Pa.—Underground clay conduit.
601-2	Automatic Electric Co., Chicago, Ill.—Automatic telephones and systems.
610-2	Belden Manufacturing Co., Chicago, Ill.—Wires, cords, etc.
136	Carnahan-Sherwood Co., Indianapolis, Ind.—Accounting system, blank books and forms.
616	Central Telephone & Electric Co., St. Louis, Mo.—Telephone apparatus, protective devices and specialties.
658	Century Telephone Construction Co., Buffalo, N. Y.—Switchboards, telephones and parts.
648	Chance Manufacturing Co., Centralia, Mo.—Lightning arresters.
620-2-4	Chicago Telephone Supply Co., Elkhart, Ind.—Switchboards, telephones and parts.
604-6	Cook, Frank B., Chicago, Ill.—Terminals, protective devices and accessories.
On Parlor Floor	Dean Electric Co., Elyria, Ohio—Switchboards, telephones and parts.
638	Durant Electric Supplies Co., Chicago, Ill.—Telephone and electric material.
662-4	Electric Appliance Co., Chicago, Ill.—Switchboards, telephones and accessories.
608	Ericsson, L. M., Telephone Manufacturing Co., Buffalo, N. Y.—Switchboards, telephone parts and novelties.
656	Eureka Electric Co., Genoa, Ill.—Switchboards, telephones and parts.
610-2	Homer-Roberts Telephone Co., Chicago, Ill.—Party line lockout systems.

Room Numbers.	
613	Indiana Steel & Wire Co., Muncie, Ind.—Wire.
102	International Telephone Manufacturing Co., Chicago, Ill.—Switchboards, telephones and parts.
644	Matthews, W. N., & Brother, St. Louis, Mo.—Anchors, cable, stringing apparatus and specialties.
611	Miller Anchor Co., Norwalk, Ohio.—Anchors.
130-2	Monarch Telephone Manufacturing Co., Chicago, Ill.—Switchboards, telephones and parts.
104-6	National Pole Co., Escanaba, Mich.—Poles.
628	Nagel, W. G., Electric Co., Toledo, Ohio.—Telephone and electric supplies.
652	National Carbon Co., Cleveland, Ohio.—Batteries and carbon specialties.
640	North Electric Co., Cleveland, Ohio.—Switchboards, telephones and parts.
660	Nungesser Electric Battery Co., Cleveland, Ohio.—Batteries and specialties.
Writing Room.	Sterling Electric Co., Lafayette, Ind.—Reception room for entertainment of guests.
637	Select Telephone Manufacturing Co., Springfield, Ohio.—Telephones and lockout systems.
634-6	Stromberg-Carlson Telephone Manufacturing Co., Rochester, N. Y.—Switchboards, telephones and parts, wire and cable.
632	Swedish-American Telephone Co., Chicago, Ill.—Switchboards, telephones and parts.
609	Universal Pole & Post Preserving Co., Circleville, Ohio.—Pole preservative, specimen treatments.
614	Vote-Berger Co., La Crosse, Wis.—Anchors, switchboards, telephones and parts.
639	Western Telephone Manufacturing Co., Chicago, Ill.—Telephones, parts and accessories.
647	Wire & Telephone Co. of America, Rome, N. Y.—Long distance hand telephones and rubber covered wire.

NO LEVERS TO PUSH OR PULL

GRAY TEL. PAY STATION CO.

HARTFORD, CONN.

OUR '07 CATALOGUE SENT ON REQUEST

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE.—We offer for sale the following assortment of Stromberg-Carlson Central Energy telephones displaced by our installation of Automatic equipment:

250 Type E central energy desk telephones with stationary head, corrugated nickel-plated pedestal, black enamel metal base, bipolar receiver, gold electrode transmitter.

1,000 No. 204 desk telephones with adjustable transmitter, knuckle joint arm, nickel-plated pedestal and base, same transmitter and receiver as above.

100 Type C. E., latest style desk telephone with No. 4 transmitter, all rubber bipolar receiver, black rubber pedestal, nickel-plated base, induction coils at end of cord instead of in base. A modern instrument.

1,000 Former type ZZ, later known as No. 37, business style central energy wall telephones complete with triplet set consisting of combined switch-hook, transmitter with adjustable arm, bipolar receiver, etc. This instrument is provided with shelf.

100 Former type Z, later known as No. 35, residence style, central energy wall telephone without shelf, otherwise same as No. 37.

These instruments are in good condition and will be sold at a reasonable figure. Prices will be furnished upon application to W. F. LAUBACH, Manager, Akron People's Telephone Co., Akron, Ohio. 822

FOR SALE—Post hole digging, hoisting and cable pulling machine mounted on trucks. Also one No. 6 cube concrete mixer, and other construction apparatus. Above used four months. Address Quincy Home Telephone Co., Quincy, Ill. 839

FOR SALE—85 Kellogg 60-cycle party-line ringers complete; 100 Kellogg 20-cycle party-line ringers complete; 8 Kellogg 60-cycle single gong desk set boxes for two conductor cords; 8 Kellogg 20-cycle single gong desk set boxes for two conductor cords; 1 Holtzer-Cabot 24 volt direct current motor generator, 75 volt alternating and pulsating generator. Address Knox County Home Telephone Co., Vincennes, Ind. 842

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

POSITION WANTED—A first class man wants to make change. Would like position as Manager or Wire Chief. Twelve years' experience. A-1 reference. Address, Box 825, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 825

WANTED—Position by good troubleman experienced in line, office, and instrument trouble. In other respects am willing to render myself generally useful. Satisfactory testimonials. Address Box 828, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 828

WANTED—Back numbers of AMERICAN TELEPHONE JOURNAL for January, February and March, 1907. Address, stating lowest price, Box 840, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 840

WANTED—Position by married man of 24 as bookkeeper or collector, six years' office experience. Wishes to learn management of exchange. Address Box 65, Jonesboro, Ind. 835

WANTED—Position with telephone company on construction or instrument work. Five years' experience, best of references. Address Box 836, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 836

WANTED—Position as manager or superintendent of telephone exchange. Central energy or magneto. Can furnish best reference as to ability, habits, etc. Address Box 841, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 841

WANTED—Salesman for telephone instruments and supplies for New York State, Pennsylvania or the Middle West. An exceptional opportunity for the right man. Address Box 843, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York City. 843

IN THE OPERATING FIELD

A. L. TETU ASSUMES MANAGEMENT OF THE HOME TELEPHONE COMPANY AT PORTLAND, OREGON.

FOR more than a year past A. L. Têtu has been general manager of the New Long Distance Telephone Company and the Indianapolis Telephone Company, of Indianapolis, Ind. A few days ago he announced that he had resigned from both of these positions to take charge of the business and development of the Home Telephone Company, which has its headquarters at Portland, Oregon, and covers a considerable territory outside of the city, including a number of important exchanges in neighboring cities and towns.

Mr. Têtu, who will have the title of general manager, will be accompanied by A. Berridge, formerly auditor of the two Indianapolis companies, and by C. J. Langdon, superintendent of the Indianapolis Telephone Company, each of whom will take a similar position in Portland. For the present the duties which formerly devolved upon Mr. Têtu as general manager of the Indianapolis companies will be carried on by James E. Brailey, of Toledo, O.

OBITUARY.

MR. GEORGE H. COLE, supervising architect for the Southern Bell Telephone & Telegraph Company, died in Atlanta on May 10th of pneumonia. He was born in Westport, N. Y., on November 24, 1838, and was connected with the Southern Bell Telephone & Telegraph Company for a period of 22 years, and he was actively engaged at his usual vocation up to within one week of his death. Prior to his connection with the telephone company he was associated with the Western Electric Company, where he was engaged in the development of the earlier forms of telephone and telegraph apparatus. His long connection with the telephone business and the high esteem in which his personal qualities were held make his loss one which will be deeply felt by many telephone men.

CONVENTION PROGRAM

The International Independent Telephone Association, Auditorium Hotel, Chicago, June 3-6, 1907.

JUNE 3—MORNING.

Meeting of Committees on Physical Standards; Standard Forms of Accounting; Standard Operating Rules and Regulations.

JUNE 3—AFTERNOON.

Meeting of Executive Committee. Meeting of Advisory Board.

JUNE 4—MORNING.

Meeting of Committees in charge of details, as follows: arrangements, entertainment, reception, registration, sergeants-at-arms.

JUNE 4—AFTERNOON.

Convention called to order; address of welcome by Hon. F. A. Busse, Mayor of Chicago; response by H. D. Critchfield, Milwaukee, Wis.; president's annual address, Jas. B. Hoge, Cleveland, O.; officers' reports; appointment of committees; Short Talks on Practical Subjects: "Construction Problems," "Shield Advertising," "Collection Methods"; open discussion; question box.

JUNE 4—EVENING.

Outing at Sans Souci Park; free tickets at registration desk.

JUNE 5—MORNING.

Committee Report, entertainment; written reports of State, territorial and provincial associations; general discussion; The Long Distance Business: "How to Handle It," Frank Hart, Pittsburg, Pa.; "Independent Improvements and Possibilities," C. E. Tarte, Grand Rapids, Mich.; "Long Distance Advertising," W. J. Stadelman, Sioux City, Ia.; "The Toll Line Clearing House," J. M. Plaister, Ft. Dodge, Ia.

JUNE 5—AFTERNOON.

Committee Reports: Standard forms of accounting; Standard operating rules and regulations; "Lest We Forget," Col. J. D. Powers, Louisville, Ky.; "Compulsory Interconnection of Bell and Independents," J. B. Earle, Waco, Texas; J. Walter Barnes, Fairmont, W. Va.; O. C. Snider, Kansas City, Mo.; "Post Office Telephones and Washington Situation," Chas. E. Sumner, Portland, Ore.; "Telephone Securities as an Investment," W. L. Moellering, Ft. Wayne, Ind.; "Frenzied Finance in the Telephone Field," Dwight E. Sapp, Mt. Vernon, O.; "Where the Copper Comes From," J. S. Haley, Livingston, Mont.; question box.

JUNE 5—EVENING.

Informal Banquet, 7:30 P. M., in Banquet Hall, Auditorium Hotel, C. W. Kline, Hazleton, Pa., toastmaster.

JUNE 6—MORNING.

Committee Report: Physical standards; "Rural Telephony—Its Value to the Community and Relation to the Independent Movement," C. H. Schweitzer, La Crosse, Wis.; "Making History in the Canadian Northwest," Francis Dagger, Winnipeg, Man.; "The Strength of the Chain," James S. Brailey, Jr., Toledo, O.; "The Indiana Situation," Chas. S. Norton, Indianapolis, Ind.

JUNE 6—AFTERNOON.

Reports of outstanding committees; report of nominating committee; election and installation of officers; miscellaneous business.

QUERIES

INSTRUCTIONS FOR MAKING A WIPED JOINT.—(866.)

Please inform me as to the proper way to make a wiped joint in cable splicing.

What to use to clean sheath and prepare it for soldering, also what to use as a soldering flux and way to proceed to solder. F. R., Kansas.

The correct method of procedure in making these joints or splices is as follows:

When the cables are in position and ready for splicing, the ends should be marked at the point to which the lead is to be removed and scored or cut entirely around. This may be accomplished by a plumber's chipping knife and hammer, marking the lead, but being careful not to cut entirely through to the insulation, which might thus be damaged.

The lead is then cut lengthwise from the circular score to the end by the chipping knife and is removed with a pair of pliers. In making this longitudinal cut great care should be used not to injure the insulation. The knife should be held at such an angle as to pass between the lead and the insulation, but not cut the insulation.

When the lead has been removed the parts where it has been scored should be examined carefully and all rough or sharp edges removed. It will be well also to "bell" the lead slightly with the handles of the pliers or some other blunt instrument.

When the lead covers of the two sections of cable have been prepared, as described, the lead sleeve is slipped over the more convenient end and pushed back along the cable far enough to be out of the way. This lead sleeve should be at least as thick as the sheathing of the cable, and in view of its exposed condition may be somewhat heavier to give it greater mechanical strength. Before slipping it on the cable each end of the sleeve is thoroughly scraped with a shave hook or a knife for a length of about two inches, and the cleaned portion thoroughly smeared with some convenient flux, preferably a tallow candle, which, by preventing the formation of the usual film of lead salts, insures a close union of the lead and the wiping metal which is used to make the joint between the sleeve and the cable sheath.

The internal diameter of the sleeve should exceed the external diameter of the lead sheath of the cable by from 1" to 1½", so as to allow for the splicing and paper sleeves.

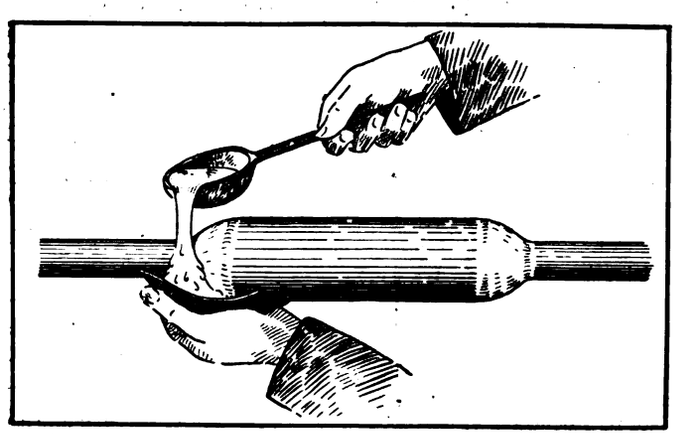

Fig. 866.

After the conductors have been properly spliced, the lead sleeve is brought into position so as to extend equally over the lead on each cable end, and the ends of the sleeve are dressed down close to the lead of the cable, care being exercised to have the lead sleeve concentric with the cable.

The sleeve and the lead of the cable are then joined together by molten solder, as shown in Fig. 866.

The solder is poured on the joint in the manner shown, and is wiped smooth with the cloth wiper, which is usually made of several layers of ticking sewed together in convenient size. The wipes must be absolutely watertight and should be carefully inspected, especially underneath the joint, which may be accomplished by means of a small mirror to insure smoothness, solidity and absence of air-holes, as the presence of small blow-holes in wiped joints causes more trouble than any other feature in cable splicing.

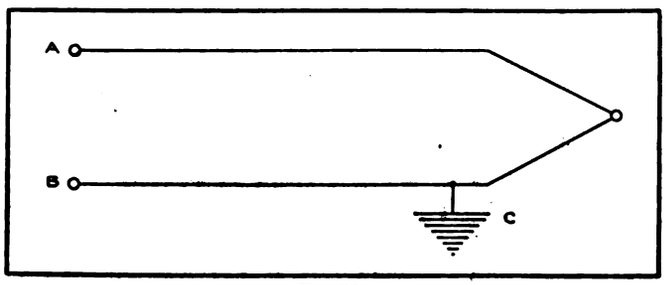

Fig. 867.

TESTING CABLE WIRES.—(867.)

We have a cable in which one wire of a pair is grounded. We have tested for it in the following manner, but have been unable to locate the fault: We measured the resistance of the wire A to ground, having previously connected the two wires at the cable box, and then the resistance of the wire B to ground, thereby expecting to be able to determine the distance by the ratio of the resistance from B to ground, as compared with the resistance of the entire circuit A to B through the cable box.

We find, however, that the resistance of A to ground plus the resistance of B to ground more than equals the resistance of the circuit A to B. We have always been of the opinion that the resistance of the earth is practically nothing and cannot account for the readings we get.

We wish to thank you in advance for the information, which we are sure will set us right. We have been depending upon the JOURNAL for some time now for information which ofttimes we have been unable to secure elsewhere, and wish to thank you for the courteous treatment we have always received at your hands. A. B. I., New York.

If the grounded fault were of practically zero resistance and the connection between the fault and the battery also of zero resistance then your method would apply and the location of the fault would be easy. However, ground connections and faults usually vary, so some method must be used in which the resistance of the fault may be disregarded.

Laving your connections as shown in Fig. 867, we will measure the resistance of the loop A. B. We will then measure the resistances A. C. and B. C., one terminal of your testing instrument being grounded. It is evident that these include the resistance of the fault to ground.

The resistances A. C. and B. C. being added together, subtracting the resistance A. B. will leave twice the resistance of C. Twice the resistance because it has been added in both A. C. and B. C. If now the resistance of C. be subtracted from B. C. it will give the resistance of B. to C. Knowing the resistance of the cable per foot the distance can be determined.

Or we can express it in the following manner:

Take resistance A B = R′
" " A C = R″
" " B C = R‴
B to fault = x ohms.
Then

$$R'' - \frac{R'' + R''' - R'}{2} = x \text{ ohms.}$$

from which the distance may be computed.

TELEPHONE PATENTS

PHANTOM CIRCUIT SYSTEM.

Jacob W. Lattig, Wyncote, and Charles Lane Goodrum, Philadelphia, Pa., patent (No. 845,796, dated March 5, 1907; filed March 3, 1904; serial No. 196,279) a system of multiplex telephony.

This patent covers a phantom circuit system in which a third circuit is created in two trunk circuits by means of balancing the lines inductively with suitable impedance coils and condensers, each trunk circuit being used as one side of the phantom. There are bridged across each trunk at each end and connected in series two condensers and an impedance coil. The coil is cut in between the condensers and a tap taken from the center of its winding to the coil to give one side of the third line.

RECEIVER HOLDER.

Mortimer H. Black, Pittsburg, Pa., patents (No. 850,558, dated April 16, 1907; filed March 6, 1907; serial No. 360,876) an attachment for telephones.

This patent covers an arrangement which may be attached to the transmitter of a telephone by being clamped around the outer edge of the face plate. A tubular arm attached to the clamp by pivots upon which it may swing has placed at its other end, at right angles to it, a resilient clasp adapted to embrace a telephone receiver. The apparatus is for the purpose of relieving the subscriber of the necessity of using one hand to support the instrument during conversation.

INTERCOMMUNICATING TELEPHONE.

Stanislaw A. Koltonski, Boston, Mass., patents (No. 846,479; dated March 12, 1907; filed December 9, 1904; renewed March 7, 1906; serial No. 304,781) and assigns to Electric Gas Lighting Co., Boston, Mass., a telephone.

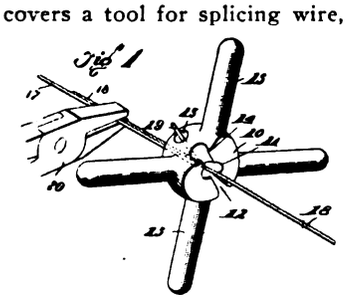
This invention relates to a form of intercommunicating telephone provided with any number of selector buttons, so arranged that when depressed a sliding plate drops over a collar and retains the button in position to connect the telephone with the line desired.

Means are provided whereupon the receiver being placed upon its retaining hook causes an actuation of the locking plate in such a manner as to release the selector buttons.

SPLICING TOOL.

Eli Bowman, Arlington, Ohio, patents (No. 852,216; dated April 30, 1907; filed May 25, 1906; serial No. 318,719) a wire splicer.

This patent covers a tool for splicing wire, and is so con-



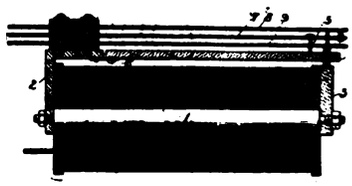
structed as to permit the end 19 of one of the wires 17, 18 to enter into a suitable groove 13, and by revolving the tool thus cause the wire end 19 to form a close fitting coil around the other wire 18. The same operation is applied to each end in turn.

During the first operation the wires 17 and 18 are kept from revolving with the tool by grasping them securely with some suitable device, as the pliers 20.

RELAY.

Harry G. Webster, Chicago, Ill., patents (No. 849,443; dated April 9, 1907; filed January 3, 1905; serial No. 239,486) and assigns to Milo G. Kellogg, Chicago, Ill., a circuit changing mechanism.

This patent covers a form of relay, to the core 1 of which is attached extensions 2 and 3. Switch springs 7, 8, 9 are



mounted upon the core extension 2 and attached to the extension by means of a steel spring 6 in the armature 4. The armature 4 is physically connected to spring 7 by the insulating bushing 5. The action of the switch lies in the movement of the armature 4 which is attracted toward the pole piece 3 upon the energization of the electro magnet, thus opening or closing the point of contact between the switch springs.

A. C. EFFICIENCY BOOSTER.

Isidore Kitsee, Philadelphia, Pa., patents (No. 844,810; dated February 19, 1907; filed July 11, 1903; serial No. 165,155) a method of increasing the efficiency of alternating currents.

This invention relates to an arrangement of a source of alternating current, suitable inductoriums, revolving commutators, and asymmetrical resistances, together in such a manner as to cause one-half of each cycle to flow through one branch of a circuit and the other half of each cycle to flow through a second branch of the circuit, the object being to combine the waning cycle's inductive effect in the transformer with the inductive effect of the cycle in the ascendency so as to produce an induced current of uniform efficiency.

METAL CROSS ARM PIN.

David Weaver, Paterson, New Jersey, patents (No. 851,577, dated April 23, 1907; filed July 7, 1906; serial No. 325,070) a cross arm pin.

This patent covers a metal pin arranged with clips so arranged as to spread below the cross arm when the pin has been driven through so as to guard against unintentional upward movement of the pin, after the wires have been attached, without resorting to the use of nuts and washers, as is the common practice. The entire patent is covered in one claim which is shown in the following:

"A cross arm pin having a shoulder and below said shoulder and spaced therefrom, curved diametrically opposite longitudinal grooves, yielding clips each having both ends in said grooves, and the intermediate portion projecting therefrom so acting with the shoulder to limit the vertical movement of the pin in its cross arm and a rivet extending through said pin and the clips."

CYCLOPEDIA OF APPLIED ELECTRICITY

Invaluable to Telephone Men.

Every duty connected with both the construction and operation of a telephone system thoroughly explained in this great work—nothing omitted. Best work published for managers, linemen, switchboard and trouble-men. Treats fully on the Automatic Telephone and Wireless Telephony. Everything explained in such a way that anyone can master it—a quick and easy short cut to more money and a better position.

LARGEST—NEWEST—HANDSOMEST

Handsomely bound in red morocco. Gold stamped. Marbled edges. Large type—easy to read. De Luxe books in every respect. Fully indexed. Contains 2000 full-page Plates, Diagrams, Descriptions, Formulae, Sections, Tables---supplemented by practical questions---especially prepared for practical men who have no knowledge of advanced mathematics by such noted authorities as F. B. Crocker of Columbia University and the Crocker-Wheeler Company, Prof. Esty, Head of the Department of Electricity, Lehigh University, and others.

Brief List of Contents

Telephone Instruments, Telephone Lines, Telephone Exchange, Telephone Operation, Automatic Telephone, Wireless Telephony, Magnetism, Measurements, Wiring, Telegraphy, Direct Current Dynamos and Motors, Electric Lighting, Railway Power and Lighting, Arc Lamp Development, Electrical Construction, Management of Dynamos and Motors, Power Station, Alternating Current Machinery, Power Transmission.

REGULAR PRICE, $30.00. **SPECIAL PRICE, $19.80.**

Sent express prepaid for one week's free examination.

If the books meet your needs, pay $2.00 within one week and $2.00 a month thereafter, until you have paid $19.80, the special price. Return, at our expense, if you do not care to keep them.

We make this greatly reduced price for 30 days to interest the public in the superior character of the instruction of the American School of Correspondence—these books being compiled from the relative instruction papers of the school. A 200-page handbook fully describing 60 courses in Electricity and Engineering sent FREE on request if you mention American Telephone Journal, 5-25-07.

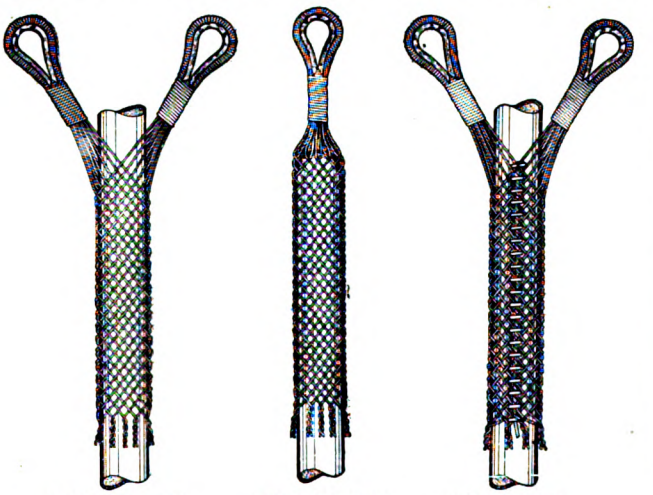
UNIVERSAL CABLE GRIPS



DOUBLE EYE. SINGLE EYE. SPLIT GRIP.

In pulling in underground cables, if there is any water in the duct and the "sling" is fastened to the cable in the customary manner of driving nails through the sheathing, the moisture sometimes enters into the cable so far that it is impossible to "cut back" beyond the trouble.

The use of UNIVERSAL CABLE GRIPS saves the cable that usually is cut off.

And they Everlastingly Hold On. Find out more about them. Write to-day.

UNIVERSAL CABLE GRIP CO., Syracuse, N. Y.

IN THE MANUFACTURING FIELD

"SUCCESS LIES IN THE KNOWLEDGE OF OUR TOOLS"

KEYBOARD WIRING FOR DEAN SELECTIVE PARTY LINE RINGING.

AN interesting arrangement of a magnet four-party Harmonic selective ringing key shelf is shown in the accompanying illustration. This key shelf possesses many unique features, the most important being the simplicity in wiring and the use of a complete iron frame construction, the hinges being fastened to the metal work, and the woodwork simply serving to cover the space not occupied by the keys. The latter are attached to this metal framework by machine screws. The simplifying of the wiring is made possible by the use of the Dean selective ringing key, which has its contacts arranged as shown in Fig 1. The plunger springs of these keys, marked 1, 2, 3 and 4, operate the contacts marked 16, 33, 50 and 66. The latter, being the same for each cord circuit, are strapped straight across the key shelf connecting the like springs of all keys. This is a newly developed method of wiring the generator to the cord circuit ringing keys, which the Dean Company has found to prevent generator inductive noise which exists, to a certain extent, where the generator leads are looped from key to key in the same cable with the talking circuits.

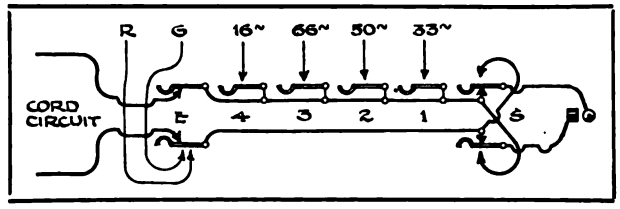

Fig. 1. Simple Dean circuit arrangement used for selective ringing.

The Dean key, used on the key shelf shown in the illustration, has but one spring contact for each plunger, and only two series contacts in the talking circuit, due to the entire four-party key. These two series contacts are located at the front end of the key structure, in plain view when the key shelf is raised, and are therefore completely accessible without removing the key from the shelf.

In the Dean switchboards the generator leads, up to the key wiring, are run with extra heavy insulated wires twisted into a special cable, which is provided with a heavy outer braiding. The generator wires are thus isolated from the talking circuit wires, and all chances for inductive disturbances are minimized.

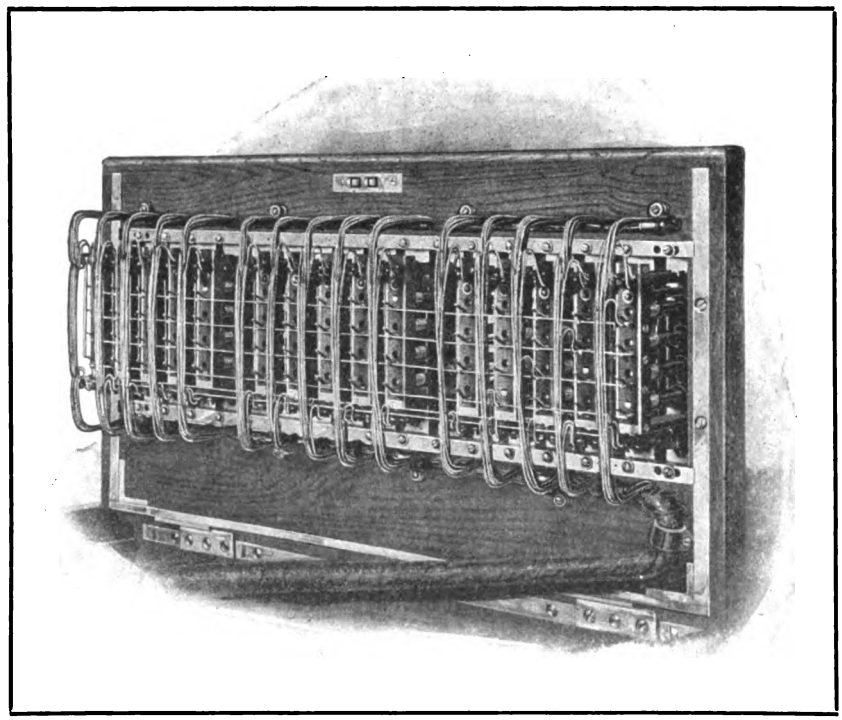

Fig. 2. Keyboard as wired by the Dean company for selective party line ringing.

The party line keys made by the Dean Electric Company are self-contained, each being arranged with four plungers for four-party selective ringing, and when so ordered contain a reversing key, "s," Fig. 1, for eight-party selective ringing.

The escutcheons, which are of genuine Bower-Barff finish, are mounted so that their upper surfaces are flush with the surface of the key shelf, thereby giving a neat and substantial construction without crevices for the collection of dirt and dust.

CHARLES W. FARR, founder and president of Farr Telephone & Construction Supply Company, of Chicago, has resigned the presidency and managership of that company to become the president and manager of a new company, Farr Electric Equipment Co., 170-172 West Adams street, Chicago. The new company will do a general electric supply business, having already secured some good agencies for different lines of electrical goods. This company will manufacture and put on the market the Farr electric deep sea sounding apparatus. The above companies are entirely separate and not connected in any way.

THE CONNECTICUT TELEPHONE ELECTRIC COMPANY, Meriden, Conn., is to break ground within a few days for a new building which will double its capacity. This company has been for a long time engaged in the manufacture of telephones and switches for intercommunicating systems, etc., and is making this addition to take care of the increased demand for its products in this and other lines.

THE CENTURY TELEPHONE CONSTRUCTION Co., Buffalo, N. Y., has just received a contract for furnishing supplies for the system of the Milwaukee Independent Company, at Milwaukee, Wis. Under the terms of the contract a plant operating 15,000 telephones is to be installed by June 1, 1908.

C. H. MACKLIN BECOMES CENTURY SALES MANAGER.

MR. C. H. MACKLIN has associated himself with the Century Telephone Construction Co., in its new plant at Buffalo in the position of sales manager.

Mr. Macklin has a very wide telephone experience, having been in the Independent field for the past twelve years, the last eight years with the Swedish-American Telephone Co.

His wide knowledge of telephone manufacturing and operating especially fit him for his new position. His many friends wish him unlimited success in his new location.

THE WEEK'S MESSAGES

NEW COMPANIES.

MOUNT PULASKI, ILL.—The Mount Pulaski Independent Telephone Company has filed articles of incorporation. It has an authorized capital stock of $5,000 and the incorporators are Herman Rentmeister, S. C. Lawson and William Baumann.

GRAYFORD, IND.—The Grayford & San Jacinto Telephone Company has been incorporated with a capital stock of $300, and the following directors elected: A. E. Grimes, D. H. Ziegler and Joseph Rogers.

McCALLSBURG, IA.—The Short Line Telephone Company, McCallsburg, with a capital stock of $5,000 has been incorporated.

READLYN, IA.—Articles of incorporation have been filed by the Readlyn Telephone Company, the incorporators being Wm. Schanewise, Henry Shutte, Fred Diekman, Fred Schoof, H. H. Meyer, Henry Westendorf, Carl Bruns and J. J. Schumacher. The following have been elected as directors of the new company: Fred Schoof, Herman H. Meyer, Henry Westendorf, Carl Bruns and J. J. Schumacher.

REMSEN, IA.—An Independent telephone company, to be known as the Remsen & Meadow Township Telephone Company, has been organized at this city, and is soon to file articles of incorporation. Temporary officers have been elected as follows: August Haack, president; Nic Land, treasurer; J. H. Ahmann, secretary, and these three, with J. A. Johnson and Peter Tjaden, constitute the board of directors.

LAKEVIEW STATION, DULUTH, MINN.—The Lake View Farmers' Mutual Telephone Company has been organized by the farmers of Lakeview.

LIBERAL, MO.—Articles of incorporation have been filed by the Liberal Mutual Telephone Company. It has an authorized capital stock of $2,000, and the incorporators are C. Lipscomb, C. A. Smith, J. G. Todd, A. S. Harvey, J. O. Pinkerton and others.

WESTPLAINS, MO.—An Independent telephone company has been organized whose intention it is to build a line from Siloam to Westplains. The officers of the new company are W. H. Brazier, president; A. J. Noel, secretary and E. A. Wiggs, treasurer.

SHERWOOD, N. D.—The Farmers' Pioneer Telephone Company, of Sherwood, has been incorporated with a capital stock of $25,000. Among the incorporators are E. M. Olson, W. S. Teters, F. J. Meekma, J. H. McFarland, Alex. Schousby and S. Fuller, of Sherwood, and Peter Schiffman of Pleasant, N. D.

PEKIN, N. D.—The Sheyenne Telephone Company, of Pekin, N. D., has been incorporated with a capital stock of $50,000. Among the incorporators are F. W. McDougall, E. A. Olsgard, McVille, N. D.; H. H. Knifel, G. T. Mark.

SILVER CITY, N. M.—The Silver City, El Paso & Southwestern Telephone Company has been incorporated and will at once commence the construction of 325 miles of telephone line, which will connect Silver City with El Paso and a large number of the leading towns in southwestern New Mexico. The organizers of the new company are J. H. Morgan of El Paso; C. B. W. D. Murray, of Central; William Bosworth, of Deming; Clyde Smith, Silver City; W. E. Baker, Las Cruces.

BELMORE, O.—The Belmore Mutual Telephone Company, with a capital stock of $2,500, has been incorporated by G. H. Bach, William Glaser, J. T. Bach, John Myers and John Busheim.

MIDDLETOWN, O.—Articles of incorporation have been filed by the Midldetown Telephone Company. The capital stock is placed at $10,000, and the incorporators are Walter S. Harlan, David B. Bundy Jr., L. T. Palmer, Allen Andrews and L. C. Harlan.

CASHION, OKLA.—An Independent telephone company, to be known as the Spring Creek Telephone, has been organized with a capital stock of $5,000, and the following directors named: A. Cornworth, Geo. W. Segbert and C. C. Cornworth, all of Cashion.

CESTOS, OKLA.—The Independent Telephone Company, of Cestos, with a capital stock of $25,000, has filed articles of incorporation. The incorporators are H. A. Seaton, Moorland, and J. W. Kerns and F. C. Hoyt, of Cestos.

MERIDIAN, OKLA.—The Meridian Rural Telephone Company has been incorporated with a capital stock of $3,000. Among the incorporators are W. M. Allen, W. W. Wickstrew and J. M. Heath.

TIVOLI, OKLA.—Articles of incorporation have been filed by the D. B. Mutual Telephone Company of Tivoli. It has an authorized capital stock of $2,000, and the directors are Alfred Dorsett, of Tivoli; J. L. Porter and J. A. Jones, of Orion.

WATERLOO, OKLA.—The Waterloo Telephone Company, Waterloo, has been incorporated with a capital stock of $500. Among the incorporators are A. S. Reed, A. Maker, J. M. George, A. L. Lynn and others.

PRINEVILLE, OREGON.—The Pioneer Telephone & Telegraph Company has been organized at Prineville and will incorporate with a capital stock of $150,000. The new company is the result of a merger between the Deschutes Telephone Company, of Bend, and the telephone interests of Jack Summers, of Prineville, and has at present about 300 miles of line in Crook county, including lines from Prineville to Madras, Bend, Laidlaw and Lesters, as well as lines up the Ochoco east of Prineville. It is the intention of the Pioneer Telephone & Telegraph Company to build 149 miles of line to Burns, and also to extend a line from Bend south through Silver Lake to a California connection.

STARRUCCA, PA.—The Starrucca Rural Telephone Company has filed articles of incorporation and has elected the following directors: W. H. Travis, of Hale Eddy; George F. Brooker, A. W. Larrabee, E. L. Wagner and S. T. Smith of Starrucca. The new company has an authorized capital stock of $4,500 and it expects to build a line from Deposit, N. Y., to Starrucca, Pa., with connecting lines to places in Broome and Delaware counties, New York State, and Wayne and Susquehanna counties, Pennsylvania.

BENAVIDES, TEXAS.—The Benavides Telephone Company, whose intention it is to construct and operate telephone lines in Nueces, Duval, Webb, Zapata, Starr, Hidalgo and Cameron counties, has filed articles of incorporation. It has an authorized capital stock of $5,000 and the incorporators are Oscar Thompson, Hebbronville; B. B. Wright, Benavides; Frank Clark, Realitos; Milton Dubost, Realitos; John Ball, San Diego; Jose A. Angel, Hebbronville.

LEWISBURG, W. VA.—The Limestone Telephone Company is the name of the new corporation which has recently taken over the plant of the Greenbrier & Organ Cave Telephone Company. The capital stock is given at $25,000, of which $11,000 has been subscribed and $3,666 paid in, and the incorporators are James Laing, E. L. Bell, W. M. Bell, Mason Bell and R. M. Bell, of Lewisburg. The new company intends to construct and operate telephone lines.

HAMBURG, WIS.—The Hamburg Telephone Company, with a capital stock of $3,000, has been organized and the following officers elected: President, Charles Emmerich; vice president, Edward Niemann; secretary, Herman Kreutz; treasurer, Henri Wiedenhoeft. Directors, Anton Emmerich, Gust. Kleinschmidt and Ernst Zielsdorf and the officers.

COQUITLAM, B. C., CAN.—Messrs. Hines and Austin are organizing a new telephone company, which proposes to build a long distance line to connect Chilliwack and Vancouver, B. C.

FRANCHISES.

HELENA, ARK.—Application for a franchise to construct and operate a telephone system in this city has been made by Messrs. Merrifield.

FULTON, KY.—The franchise for the Rural Telephone Company has been purchased by J. D. Kennedy.

ST CLAIR, MO.—The St. Clair & Eastern Telephone Company has been granted permission to build lines in Marine, Alhambra and Pin Oak townships.

FESSENDEN, N. D.—The James River Farmers' Telephone Company has been given permission to erect and maintain a telephone line in this city.

FESSENDEN, N. D.—The petition of the German-Oshkosh Telephone Company to build and maintain a telephone system in Fessenden has been granted.

ELECTIONS.

COMPTON, CAL.—The following officers have been elected by the

NEWS—WANTED

THE matter contained upon the Message and Operating Field pages of this paper is contributed largely by our special correspondents. We believe, however, that there are many valuable items of telephonic interest which are never brought to the attention of the public. There is no reason why this condition should exist, and the Editor, therefore, invites all telephone companies and the officials of such companies, to furnish any information that they can consistently make public relative to financial statistics, new construction, elections, franchises and personal items.

Bridged

Modern Engineering Practice —12 vol.—½ red morocco FREE to students enrolling now for regular course.

¶ There is no haphazard guess-work about the building of railroads—the bridging of yawning chasms. Every detail of construction—every little problem has been solved—every move has been carefully planned and written down on paper before a stroke of work is done. Success or failure does not lie in SOME ONE'S ABILITY TO REMEMBER.
¶ Have you planned your life's work with like care? Are you holding your present position by accident or by choice? Will you be holding a better position five years hence, earning more money BECAUSE you are planning step by step to reach such a position, or are you merely hoping and wishing that something will "turn up" to help you?
¶ If you are a young man without a profession or trade, an older man dissatisfied with poorly paid, uncongenial work, you can better yourself by studying in your spare hours. Send for our FREE hand-book to-day, describing over Sixty Engineering and Technical Courses. Mark the subject and let us help you plan a paying career. Mention American Telephone Journal, 5-25-'07.

THE WEEK'S MESSAGES

Compton Home Telephone Company: President, W. L. Frew; vice president, A. W. Miller; secretary, A. J. Shepard; terasurer, W. G. Legg; manager, C. E. Wood.

LOUISVILLE, KY.—The Kentucky Independent Telephone Association at its annual meeting at Louisville elected the following officers: President, M. B. Overly, Louisville; secretary, W. G. Turpin, Henderson; treasurer, J. W. Chambers, Winchester.

JACKSON, MINN.—The new officers of the Jackson Telephone Company are T. H. Stall, president; Noah Ramey, vice president; A. O. Nasby, secretary and treasurer.

NEW ULM, MINN.—The following officers and directors have been elected by the New Ulm Telephone Company: Fred Pfaender, president; Alex. Russell, vice president; F. H. Retzlaff, secretary; H. P. Bastian, treasurer; directors, F. H. Retzlaff, Otto Schell, P. Liesch, J. P. Graff, Fred Pfaender and H. P. Bastian, New Ulm; Martin Schnoberich, Jos. Wiesner, Cottonwood; Fred Rolleff, Herman Pfaender, J. A. Seilner, Alex. Waibel, Fred. Wellner, H. F. Schrader, Julius Schroeder, Fred. Foss, Alex. Russell and John Durbahn.

ALBANY, N. Y.—The Home Telephone Company has elected the following directors: James Moore, T. Henry Dumary, William H. Keeler, Albert Hessberg, E. R. Todt, Howard Hendrickson, Eli M. Woodard, Richard Stephens, S. B. Rawson, I. H. Griswold, T. M. Brush, F. H. Sudro, E. F. Allen, E. E. Williams, H. H. Bender.

AMSTERDAM, N Y.—The following officers and directors were elected by the Amsterdam Automatic Telephone Company: President, Willis Wendell; vice president, W. B. Charles; treasurer, Geo. McClumpha; secretary, Burton Fisher. Directors: Willis Wendell, J. K. Stewart, Geo. McClumpha, W. B. Charles, A. W. Breedon, L. B. Harrower, D. Ostrom, J. T. Sudgen, Burton Fisher, A. R. Conover and Samuel Wallin.

FOND DU LAC, WIS.—The Woodhull Telephone Company has named as its president O. S. Fenner; vice president, R. Porter; secretary, M. B. Stratz; treasurer, Frank Schaefer. Directors: O. S. Fenner, Ralph Porter, M. B. Stratz, Frank Schaefer, C. H. Estabrooks, A. Rausch and J. A. Stratz.

FINANCIAL.

EARL, ARK.—The Earl & Tyronza Telephone & Telegraph Company, of Earl, has increased its capital stock from $5,000 to $10,000.

LA PORTE, IND.—To take care of its new construction work the La Porte Telephone Company has decided to increase its capital stock from $60,000 to $100,000.

GRATIOT, O.—The Gratiot & Brownsville Telephone Company has increased its capital stock from $10,000 to $15,000.

PAYNE, O.—The capital stock of the Payne Home Telephone Company, Payne, has been increased from $15,000 to $25,000.

FARGO, OKLA.—The Blue Ridge Telephone Company, of Fargo, has increased its capital stock from $1,000 to $5,000.

MANKATO, MINN.—The capital stock of the Mankato Telephone Company is to be increased from $100,000 to $150,000.

NEW YORK, N. Y.—The shareholders of the Central & South American Telephone Company, with offices at 66 Broadway, New York, have decided to increase the capital stock from $8,000,000 to $12,000,000. Of the $4,000,000 of new stock, $2,000,000 is to be distributed to stockholders as a 25 per cent. dividend. The remaining $2,000,000 will be issued whenever the directors deem it advisable. It is expected that about $2,000,000 will be expended in the construction of a new cable line to Colon.

PERSONAL.

J. P. BOYLAN has recently accepted the position of superintendent of service with the Home Telephone Company, of Detroit, Mich., having left Cleveland to take up his new duties on May 15th.

HARRY W. JOHNSON has recently been promoted from the position of superintendent of the Indiana division of the Huntingdon & Clearfield Telephone Company to a similar position at Phillipsburg, Pa., which carries greater responsibilities.

C. W. SNOW, electrical engineer, Montreal, Que., has been appointed superintendent of the telephone system at Kenora, Ont.

W. J. STANTON has resigned his position as general superintendent of the Corn Belt Telephone Company, at Waterloo, Ia., to accept the position of sales engineer with the American Electric Telephone Company, of Chicago, Ill. He will, however, continue to act as consulting engineer for the Corn Belt Telephone Company.

W. T. STROMEYER, of Dallas, has accepted the position of manager of the West Texas Telephone Company at Brownwood, Texas.

A. HUGH WHITE has recently been appointed manager of the exchange of the Chicago Telephone Company at Joliet, Ill.

New Construction in the Field

LOS ANGELES, CAL.—The Home Telephone Company is preparing to expend $1,000,000 in improvements in this city. Its entire plant is to be made an all cable distribution system and a great amount of conduit work is planned.

WILDOMAR, CAL.—Lines from Elsinor to Wildomar are to be built by the Home Telephone Company.

BLUFFTON, IND.—It is the intention of the United Telephone Company to make extensive improvements in its system this summer.

FORT WAYNE, IND.—The Home Telephone Company is arranging to make a great many extensions of its rural lines in Allen County.

LAFAYETTE, IND.—The Lafayette Telephone Company has commenced the installation of its new exchange, and the work of placing the cables in conduits will be started at an early date.

COUNCIL BLUFFS, IA.—At a meeting of the directors of the Independent Telephone Company it was resolved to expend $42,000 in new construction work this year.

WASHINGTON, IA.—The plant of the Washington Telephone Company is to be reconstructed, and it is estimated that about $10,000 will be spent in this work.

NEW ORLEANS, LA.—The Independent Telephone Company, which expects to enter Nashville, is soon to commence the construction of its line from Birmingham to New Orleans.

BENZONIA, MICH.—The lines of the Benzie County Telephone Company are being extended throughout Benzie county, and its system otherwise improved.

GRAWN, MICH.—Lines are being constructed in South Grant by the Grawn Rural Telephone Company.

SEBEWAING, MICH.—It is the intention of the Valley Telephone Company to improve its system at this place very materially, making the plant up-to-date in every particular.

ST. PAUL, MINN.—The Tri-State Telephone Company expects to install a new branch exchange in the building for which it recently paid $17,000.

EXCELSIOR SPRINGS, MO.—Many improvements in its plant are being made by the Home Telephone Company.

PALMYRA, MO.—Extensions and improvements are being made by the Palmyra Telephone Company and upon their completion the plant will be up-to-date in every particular.

GIBBON, NEB.—A new switchboard is to be installed by the Home Telephone Company, and its system otherwise improved.

APALACHIN, N. Y.—New lines are being construsted by the Little Meadows Telephone Company in this city.

CLIFTON SPRINGS, N. Y.—The Clifton Springs Rural Telephone Company contemplates the extension of its lines north of the city.

NAPOLEON, O.—The Henry County Mutual Telephone Company, recently organized, expects to build and operate lines in Henry, Lucas, Fulton, Williams, Defiance, Paulding, Putnam, Hancock and Wood counties.

SPRINGTOWN, TEX.—The lines of the Farmers' Telephone Company are to be extended.

SWANTON, VT.—The lines of the Northern Telephone Company are to be extended to West Swanton.

SPOKANE, WASH.—It is the intention of the Northern Pacific Railroad Company to install a private telephone exchange, doing away with the service of the Pacific States Telephone & Telegraph Company. About fourteen lines are to be installed and connections effected with the dispatchers' offices at Pasco, Wash., and Trout Creek, Mont.

GLENWOOD, WIS.—The Glenwood Telephone Company is preparing to build new lines to Forest and Emerald. A number of farmers' lines are to be built and the plant generally improved.

HAMIOTA, MAN., CAN.—The municipality is making arrangements for the construction of a rural telephone system. Address J. H. Houch, Hamiota, Man., Canada.

UNDERGROUND.

MATTOON, ILL.—The Coles County Telephone & Telegraph Company has been given permission to place its wires and cables in conduits in this city.

ROCKWELL CITY, IA.—The wires of the Central Mutual Telephone Company are to be placed underground in the business portion of this city.

LOUISVILLE, KY.—The Home Telephone Company expects to place its wires in conduits in the central portion of Louisville.

DETROIT, MICH.—The Home Telephone Company has applied for permits to lay sixty-six miles of underground wires.

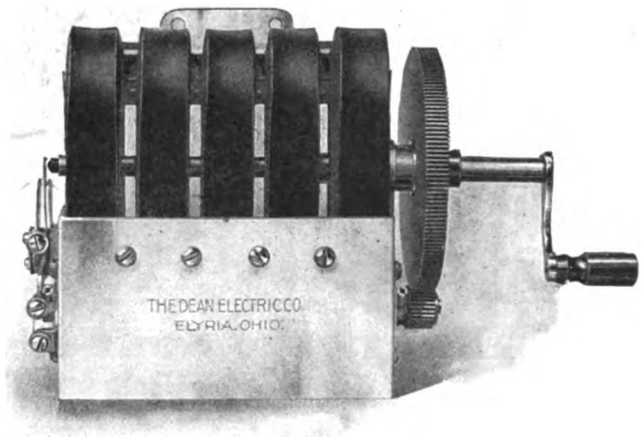
DEAN TELEPHONE APPARATUS

DEAN GENERATORS

BEST DESIGN——CONSTRUCTION——WORKMANSHIP



The best design, selected material and skilled workmanship make our three, four and five bar Dean generators the best on the market. The gear wheels in our machines are stamped and cut out of cold metal thereby avoiding casting defects. Any piece of defective metal is bound to show up during the stamping out and cutting process. We make the gear wheels of brass to prevent rusting and cut each tooth separately making every tooth perfect. The armature framework is built in a very substantial manner and we call especial attention to the very accurate magnetic air gap and the uniform output of our machines. All shunting contacts are platinum pointed, and we furnish, when so ordered, pulsating and direct current generators. We make our own generators and will cheerfully furnish special information regarding them at any time.

TROUBLE!!

When you have found that the trouble in your telephone cable is in a certain joint, it is not necessary to blow the joint or cut the sleeve when you use HARGIS CABLE SPLICING JOINTS. Just take your pair of spanners, unscrew the pot from the ring, unlace the pairs and spread them out like a fan. You can then test the pairs with greater ease than you can with a horizontal wiped joint, on account of the ease in getting at the inside pairs. You don't have to go all over the work again of soldering a seam in your sleeve and wiping the ends of a joint when the repair is made; just screw the pot on the ring and tighten with spanners and you have a perfect joint.

Absolutely moisture proof. Made in three sizes. Costs less on first installation. Saves money while in use. Send in your order to-day.

THE IRON WIRE BALLAST

AND ITS APPLICATIONS

TO SUBSCRIBER'S LINE CIRCUIT

In this application the ballast is placed directly in series with the subscriber's line lamp, central battery and the subscriber's line sub-station set. The ballast protects the line lamp from an over voltage and acts as a self adjusting automatic resistance to maintain constant potential across the lamp terminals. The result is that the line lamp gets the same voltage on a short line that it does on a long line. The ballast line lamp replaces the line circuit relay in common battery switchboards.

TO OPERATOR'S RINGING LEADS

This application of the ballast protects the voltage of the operators when one of them is ringing upon a line that is short circuited. The ballasts for this work are supplied with Edison bases, so that they can replace carbon lamps already in use. Under normal conditions these ballasts will measure about 25 Ohms. However, when the operator rings upon a short circuited line, the resistance of the ballast increases instantaneously to approximately 400 Ohms. The action is as instantaneous as a carbon lamp, and there is no possibility of failure in action.

TO REGULATE CURRENT RECEIVED IN SUBSCRIBERS' TRANSMITTERS

By placing the ballast in the transmitter feed in the exchange and increasing central battery voltage, practically the same transmission qualities are given to telephones located at a distance from the exchange as are given to the transmitters near the exchange. When placed in series with these lines, the ballast regulates the current so that the transmitters will always receive their full amount of current, and none of them can receive current enough to injure them. Hence, the transmitters will talk to their fullest efficiency, irrespective of the distance they are located from the central exchange.

THE VOTE-BERGER COMPANY, La Crosse, Wisconsin, sole owners of The V-B Iron Wire Ballast Patents, are now prepared to make immediate deliveries on ballasts equipped with Edison bases for operator's ringing leads.

A line from you, addressed to Department C, THE VOTE-BERGER COMPANY, La Crosse, Wisconsin, will bring you complete and interesting information regarding this and other applications of the iron wire ballast.

If you are contemplating purchasing a common battery switchboard, do not delay sending in your plans or specifications. Sales engineers of THE VOTE-BERGER COMPANY will call upon you if you desire.

A COMPLETE SECTION OF THE BALLAST MULTIPLE BOARD WILL BE EXHIBITED AT THE ANNUAL CONVENTION, AUDITORIUM HOTEL, CHICAGO. CALL AT PARLOR NO. 614 AND SEE IT.

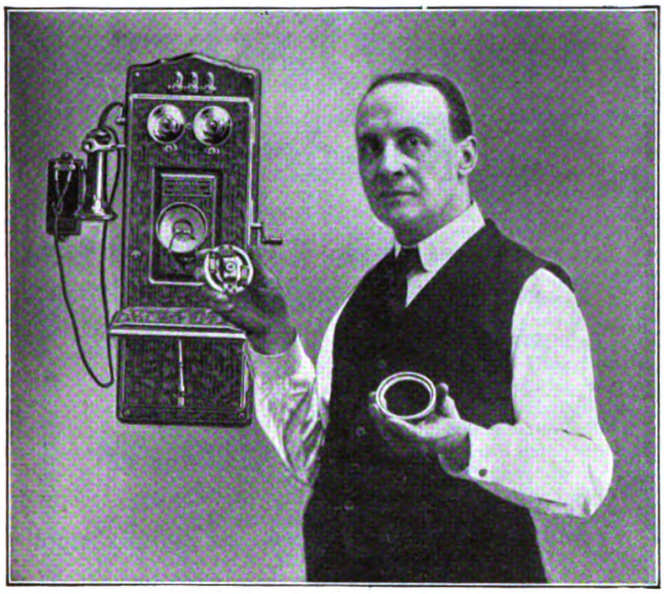
ANDRAE



No Trick at All.

Talks With the Trouble Man

Did you ever take the little screws out of the case of your transmitter and have them drop on the floor, then spend an hour trying to find them and finally give it up in disgust? This never happens with the ANDRAE TRANSMITTER. There are no screws in the case. It is clamped together by a large threaded ring, easily removed and yet firm and positive in its grip. Our transmitter never gets loose or vibrates and its mechanical construction is the best yet produced.

When it comes to talking, this transmitter can't be beat. There is no rattle or jar to it, but just a clear, positive reproduction of the voice. It is made up of imported French carbon granules that never pack.

One of the best illustrations of the workmanship in this transmitter is the fact that it has now been on the market for six (6) years, backed by an unlimited guarantee and the number replaced has not been worth mentioning.

It is like all the rest of the Special Heavy GIANT Bridging Telephone. It is built for business and the harder you work it the better it works. You may try them at our expense.

CONDENSERS

We have been shipping condensers to London and Honolulu since I talked to you last month. This shows that their popularity is spreading in all directions.

Whenever you hear complaints that the bells ring only part of the time, you can make up your mind that the line needs condensers. They will cure this trouble every time. They are so inexpensive and so practical that it is no wonder up-to-date Telephone Systems are adopting them everywhere.

IF YOU HAVE RINGING TROUBLES, TRY CONDENSERS

Don't waste time and money repairing ringers. Don't put it off. DO IT NOW.
You can have one line completely equipped on trial and return them at the end of 30 days at our expense.
WRITE US ABOUT IT TO-DAY!

Actual Size of Instrument. Three in One—Ammeter, High and Low Reading Voltmeter.

Every Exchange Needs One

If you use one of our voltmeters once, you will acquire the voltmeter habit and never give it up.

Do You Know

that the instrument shown on the right gives both volt and ampere readings?

That you can use it for the measurement of resistances?

That it is low in price?

That it is accurate?

New Switchboard Instrument.

That our triple scale instruments will measure the voltage of a single cell or that of an electric light main?

That you can measure the resistance of your lines with it?

That you can measure the resistance of your ringers and induction coils with it?

That you can test insulation up to 100,000 ohms with it?

Yet the cost is low and if you write us we will make a price that you can afford to pay.

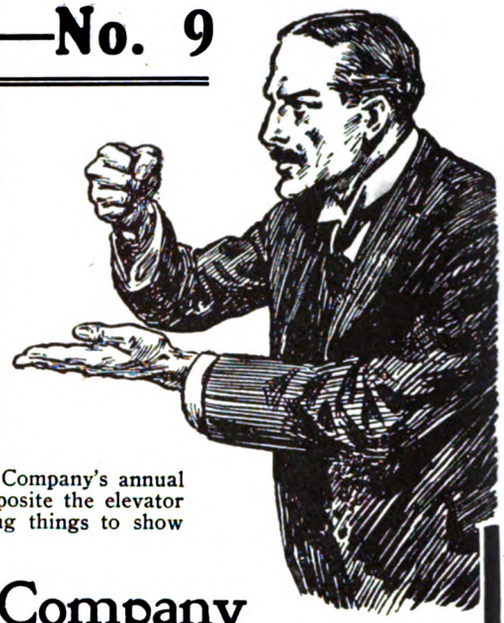
Talks With The Buyer—No. 9



When you have not met a person, you form your ideas of them, which are sometimes changed when you meet them face to face.

Collectively I think you are the most interesting set of men I have ever talked to. Individually, I have met many of you and have not been disappointed. Is there not also curiosity upon your part, to a certain extent? Now, I want you to merge my individuality into that of the house.

Every business concern has its own individuality. They say a corporation has no soul, but it has a heart which beats light or strong with the desires and ambitions of the men who control the destinies of that corporation. If its purposes are right, that corporation may become as good and true a friend of yours as though it were a real person.

Of course, you are going to attend the International Telephone Convention to be held at the Auditorium Hotel, Chicago, June 4th to 6th. I want to have a chance to meet you and have a little heart-to-heart talk with you. I want you to meet, if you have not already done so, the gentlemen who are at the head of this concern, and let us tell you personally some of the reasons why this Company is occupying a unique position in the telephone field, and should bear a peculiarly intimate relation to your Company's annual dividends. I shall expect to see you then in Room 616, which is right opposite the elevator as you reach the Convention Hall Floor. We will have many interesting things to show you.

The Long Hoped-For One Slot Pay Station

IT IS THE LIVERMORE

Tested in the laboratories of leading telephone companies and not a single mechanical or operating defect found.

Only one slot removes all possibility of coins being dropped in the wrong slots. The public is relieved of mental responsibility and physical also because

THE LIVERMORE IS AUTOMATIC

There are no levers to pull or push. Objections to old forms of automatics are overcome by perfected signalling method. Signals are not directly in the path of the coins, but are sounded by the rebound of the coin.

The transmitter is not in metallic contact with the coin chutes. Consequently the rattling of the coins in the chutes does not confuse the operator.

A bell metal resonator is used as a support for the signal gongs, and to this resonator the transmitter is also affixed in metallic contact. Thus loud, clear and distinguishable signals are always given the operator.

Complete description and prices will be furnished every telephone company on application.

"It might interest you

to know that the total maintenance expense of parts for our entire plant of 3,000 switches for the past eighteen months has been $10.24," writes Supt. J. A. Duncan, of the Sioux City Telephone Company, Sioux City, Iowa. (This company operates our AUTOMATIC TELEPHONE SYSTEM.)

"A like sum

would perhaps take care of the repair cost on operators' chairs in a manual exchange of the same size," adds Mr. Duncan. (We'll be glad to send you a copy of his letter if you'd like to see it.)

It occurs to us

that the one item of switchboard cords alone for a manual exchange of 3,000 lines would amount to at least $150 in eighteen months. That is fifteen times the cost of all repair parts on the Sioux City automatic exchange.

That is only one

of the many economies of the AUTOMATIC SYSTEM. These economies all help to swell the profits. And—the AUTOMATIC, being the best service, commands the highest rates. Low production cost plus high selling price equals big dividends. That is what led to the adoption of the AUTOMATIC TELEPHONE SYSTEM in the following cities:

Aberdeen, S. D.
Akron, Ohio.

CONVENTION PROGRAM

The International Independent Telephone Association, Auditorium Hotel, Chicago, June 3-6, 1907.

JUNE 3—MORNING.

Meeting of Committees on Physical Standards; Standard Forms of Accounting; Standard Operating Rules and Regulations.

JUNE 3—AFTERNOON.

Meeting of Executive Committee. Meeting of Advisory Board.

JUNE 4—MORNING.

Meeting of Committees in charge of details, as follows: arrangements, entertainment, reception, registration, sergeant-at-arms.

JUNE 4—AFTERNOON.

Convention called to order; address of welcome by Hon. F. A. Busse, Mayor of Chicago; response by H. D. Critchfield, Milwaukee, Wis.; president's annual address, Jas. B. Hoge, Cleveland, O.; officers' reports; appointment of committees; Short Talks on Practical Subjects: "Construction Problems," "Shield Advertising," "Collection Methods"; open discussion; question box.

JUNE 4—EVENING.

Outing at Sans Souci Park; free tickets at registration desk.

JUNE 5—MORNING.

Committee Report, Entertainment; written reports of State, Territorial and Provincial associations; general discussion; The Long Distance Business: "How to Handle It," Frank Hart, Pittsburg, Pa.; "Independent Improvements and Possibilities," C. E. Tarte, Grand Rapids, Mich.; "Long Distance Advertising," W. J. Stadelman, Sioux City, Ia.; "The Toll Line Clearing House," J. M. Plaister, Ft. Dodge, Ia.

JUNE 5—AFTERNOON.

Committee Reports: Standard forms of accounting; standard operating rules and regulations; "Lest We Forget," Col. J. D. Powers, Louisville, Ky.; "Compulsory Interconnection of Bell and Independents," J. B. Earle, Waco, Texas; J. Walter Barnes, Fairmont, W. Va.; O. C. Snider, Kansas City, Mo.; "Post Office Telephones and Washington Situation," Chas. E. Sumner, Portland, Ore.; "Telephone Securities as an Investment," W. L. Moellering, Ft. Wayne, Ind.; "Frenzied Finance in the Telephone Field," Dwight E. Sapp, Mt. Vernon, O.; "Where the Copper Comes From," J. S. Haley, Livingston, Mont.

JUNE 5—EVENING.

Informal Banquet, 7:30 P. M., in Banquet Hall, Auditorium Hotel, C. W. Kline, Hazleton, Pa., toastmaster.

JUNE 6—MORNING.

Committee Report: Physical standards; "Rural Telephony—Its Value to the Community and Relation to the Independent Movement," C. H. Schweitzer, La Crosse, Wis.; "Making History in the Canadian Northwest," Francis Dagger, Winnipeg, Man.; "The Strength of the Chain," James S. Brailey, Jr., Toledo, O.; "The Indiana Situation," Chas. S. Norton, Indianapolis, Ind.

JUNE 6—AFTERNOON.

Reports of outstanding committees; report of nominating committee; election and installation of officers; miscellaneous business.

The Era of Solidification

HAVING passed the formative period, the Independent telephone industry has within a comparatively few months begun to assume almost a new character. In the early days the energies of the pioneers were taxed to the utmost to find out how to handle an infinite number of details, and develop their business in the face of strenuous competition.

Now the business is established in hundreds of important centres, and well trained men are available for it.

What remains to be done beyond the upbuilding of the units is to link them together in a firm system of national—yes, and now of international—extent. The determination of standards for construction, getting all companies to adopt uniform methods of operating and accounting, and the development of toll business, are now the principal matters before the Independent telephone men. By their very nature these subjects demand the consideration of an all-including body. They at once represent the coming work of the Association, and show the powerful position attained by Independent companies.

Managing a Telephone Company's Supply Department

By M. R. Tracy, Storekeeper for the Toledo Home Tel. Co., Toledo, O.

THE storekeeper as a member of the organization of a modern telephone company performs two-fold duties, and he of all others has a right to rebel because he was not born twins. He is, under one head, a warehouse foreman and in addition to his manifold cares coming under this classification must from time to time turn about and become a bookkeeper. As a warehouse foreman he knows his stock, how and where it is procured, how much to carry, the use of each article and where it is kept. As the stock which he must constantly carry in his warehouse frequently includes two or three thousand "samples" and the separate classes of supplies differ greatly in size, shape, material and the amount to be kept on hand, this last is no small task.

Fig. 1. Mr. Tracy at his desk, which is surrounded by neatly arranged cabinets for miscellaneous material.

To get supplies, he issues a requisition upon the Purchasing Department for whatever his judgment tells him he will need for a definite period. The quantity to be carried depends so much upon local conditions that no definite rule could be laid down, or followed. His storeroom capacity may be unreasonably limited so that he could not, if he would, carry an adequate supply of certain articles. Then the work on hand or to be done in the near future must be considered, although the material for any special work is usually provided for in advance by the Engineering Department at the time the job is planned. The records of his office should show him how much of each line of standard material is used in a given period, and then his knowledge of his available space ought to enable him to decide how much to order. Usually he should order at least three months' supply at a time in order that there may be no chance of a slip-up owing to some unexpected demand from one of the departments, or some unanticipated slowness in delivery of a future order, but even this rule must be taken with allowances. Where shipments are known to be quick and the goods are bulky, perishable, or involve a large cash outlay, ordering once a month is allowable. Then in the case of small items of infrequent use and costing but little, a year's supply may well be ordered, as the extra convenience and elimination of work in his department more than make up for the interest on the money thus tied up in idle stock.

The practical work of placing the material in the warehouse where room is limited is a very vexing one, and unless some forethought is used, is never settled. For small articles there is very little doubt that the most convenient arrangement is a series of well designed and neatly arranged cabinets, having drawers which may be subdivided, if necessary for economy of space and making small quantities of various supplies more accessible. The cabinet shown at the left of the writer's desk is the most satisfactory he has found, but even this method of storing must not be carried too far. This cabinet has about seventy drawers, each 8"x10"x24", labeled, numbered and indexed. There is also another smaller cabinet, and another still smaller, shown in Fig. 2, consisting of small tin boxes, 2"x2"x 3½" in size. This latter is used almost exclusively for screws, of which, as is well known, a well assorted stock must be kept on hand by every telephone company.

On the face of each box appears a neat label which indicates the nature of the contents, giving only as much information as is required for identification. The boxes are also numbered and indexed. The indexing is very important as it saves time, and enables the storekeeper to keep track of his stock in a convenient manner. Many of the drawers are subdivided and a convenient way of arranging the practical details of this subdivision is shown in Fig. 3. There one may observe the appearance of one of the learge drawers when opened. Supports are provided on the inside of the drawer for four trays which are so placed that any one of them can be slid out by itself. When slid out it rests upon a support as shown in the illustration, so that there is no necessity for removing the tray from the drawer, nor is there any danger of mixing up the contents by an accident due to careless handling. These trays contain one hundred and thirty-two small tin boxes, each tray being for a separate line of material. One is for insulating bushings only, and contains all the bushings the storekeeper carries in stock, so that a glance will show him where any one article is. Another is for special screws; a third is given up exclusively to small parts for repairing telephones and the fourth is for small private branch exchange and central office switchboard parts. It is very convenient and when closed can not be distinguished from the other drawers. In addition to the cabinets mentioned it has been found desirable to keep a stock of the screws most frequently called for by instrument installers in a special, conveniently located place. In Fig. 7 is shown the

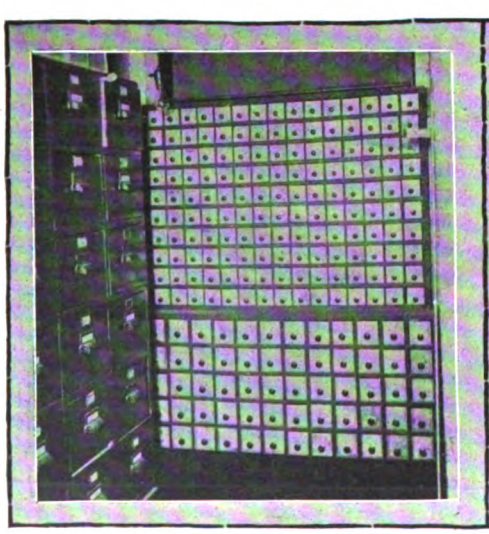

Fig. 2. Cabinet in front is used almost exclusively for small screws. Each box labeled, "¾-8, F. H."; "⅞-4 R. H. Brass," etc.

Digitized by Google

case provided for this purpose, which is located near the door where material is issued. It swings out from beneath the writing shelf. The paper file hanging on the wall above carries records of tools charged to the men.

For telephones and similar material, the writer likes a system of cupboards with doors constructed in the manner shown in Fig. 5.

Coming to that part of the storekeeper's work which may be called bookkeeping it is found that he issues a requisition on the purchasing department for all material needed for his stock. If the order is for material to be used on any especially important piece of work it is well for the storekeeper to keep a carbon copy, but as his original is filed in the office of the purchasing department, where it is accessible to him without difficulty, the decision in each case may properly be left to his option. As soon as the requisition is made out, if it calls for standard material, it should go to the manager for his O. K., and then to the purchasing department. If the material is to be used for some special work the requisition should go first to the superintendent of the department in which it is to be used, and then to the manager. This is a needed safeguard against getting wrong material, through improper description or naming of the apparatus wanted.

Right here is a good place to emphasize the fact that records are for the purpose of *recording* and must be connected, linked like a chain, so that any article that they

show to have been bought or used can be traced from the time it was ordered to the man who used it. Moreover, the records themselves should show what it was used for, and when it was used. All intermediate records, from the time of the purchase of the article to that of putting it in service should be so arranged as to show what person is responsible for the goods at each stage of their passage, and when this responsibility is transferred.

When the purchaser places his orders he sends carbon copies of them to the storekeeper, who files them in numerical order. Using this in its original form as the beginning of his record, the storekeeper notes on it the details of this transaction which relate to this department, from start to finish.

The very simple system for keeping track of the goods will be clear to one who examines the order reproduced in Fig. 6. As each shipment comes in it is checked, and the date and amount of goods filled in on the blank lines marked by a rubber stamp. The amount of freight on each delivery is written beside the stamp mark, so that all information appears on one paper and no tedious cross-references to records kept in different places are required.

THE AMERICAN TELEPHONE JOURNAL said in May, 1906, that the order reproduced in Fig. 6 was the "largest for cable placed by an Independent telephone company in 1906." It involved a sum of over forty thousand dollars. The Toledo Home Telephone Company generally places an order for five hundred dry batteries or a thousand cross arms at a

time to get "quantity price," but has them delivered in small lots. Orders for other material are placed in accordance with the requirements of the department using the goods, and, as previously mentioned, local conditions vary so greatly that it is hardly practical to lay down any general rules as to the amount to be purchased at a time.

It has happened in this office that some of the small lots have been billed when delivered and then, when the order

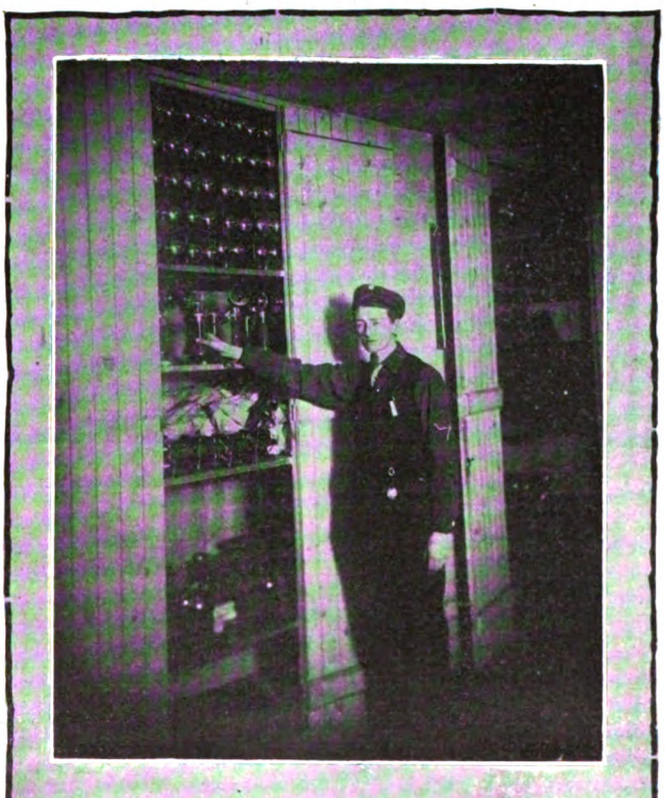

Fig. 5.. Helper A. B. Perman removing telephone from an instrument cupboard in the Toledo storeroom.

was completed, a blanket bill has been sent for the whole amount, thus showing a lack of system on the part of the shipper by billing twice for the same goods. To prevent accidents of this kind, when the writer "O. K.'s" a bill he

Digitized by Google

at the same time stamps his name across the proper place on the order, showing the goods have been received. This is then very clearly shown, for each of the separate shipments on the cable order reproduced in Fig. 6, except the last. The stamp is omitted in this item because the invoice was not received with the goods, and had therefore not been passed. Then the auditor's office, by means of a rubber stamp, shows a place on the bill where the storekeeper records the order number, the account to which the material is to be charged, and also a place for the storekeeper to sign as to quantity. These data (Fig. 8), filed in his office, show that the goods are actually in stock, the transaction being thus complete, and his records of it also complete on one paper.

After the bill has been to the storekeeper and received his O. K. in proper form it is incorporated in a voucher by the auditor and filed; later the storekeeper enters upon his "permanent record" card, which will be shown and explained later on in this article, the date, quantity, price, amount of goods and voucher number. With these data the storekeeper can trace any article from the time it was ordered to the time it reached the storeroom. Later on will be

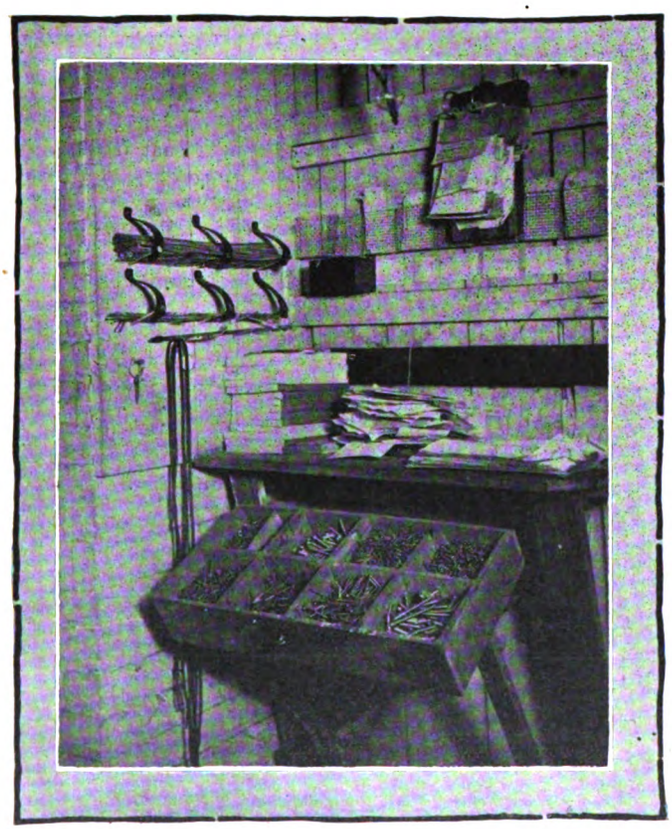

Fig. 7. Swinging case for screws used by installers, and other conveniences in a corner of the Toledo store room.

shown the chain of records for tracing this material to the man who used it and where it was used. At present this article is treating *incoming* material only.

Before dismissing the subject of approving bills, it is well to consider the subject of freight allowance on goods that are supposed to be delivered prepaid. Everyone knows that many firms sell goods "freight prepaid," but ship them "freight collect," and then deduct a "freight allowance" from the invoice. This is all proper if the freight allowance is correct, but does one know that it is, and how is one to make sure of this? A good plan is to note on the carbon copy the amount of freight paid and then compare; or the arrival notice can be filed for reference. The writer prefers the former plan. The record of the amounts of freight on each shipment, it will be noticed, is placed immediately beside the statement of the receipt of the goods on the form shown in Fig. 6. Keep all carbon copies, they never grow old. An instance is recalled where a carbon copy of the purchasing order nearly a year old was very useful.

A very troublesome subject is that of buying tools for

employees to be paid for by the men on "next pay day." An effective and safe way for the company to handle this is for the storekeeper to issue a requisition on the purchasing department the same as for material for the company, excepting that the requisition reads "For Mr. O. C. Jones," or whoever the man is. Mr. Jones is given the purchasing order and selects the tools, being his own judge of quality and price. As in other cases, the storekeeper receives a carbon copy of the order and it reads "For Mr. Jones." When the invoice comes through the storekeeper, checking it with the carbon copy, notes on the carbon the name of "Mr. Jones." Now, having the invoice and the carbon copy as reminders, he knows how much to charge Mr. Jones, and leaves a bill with the paymaster to put in Mr. Jones's envelope. There is no guessing or depending upon memory.

The regular invoice is then passed to the auditor to be paid along with other bills from the same firm. But the company has to provide some tools for men to use in their work, and a proper, permanent record of this material, which is the company's own property, must be kept by the storekeeper.

(*To be continued in issue of June* 18.)

PREVENTING ATTACKS OF CABLE BORING INSECTS.

INTEREST in the subject of damage to telephone cables from the attacks of insects has recently been revived by reports of their appearance in certain sections of California, and in the Chicago stockyards. John Hesketh, electrical engineer in charge of the government telephone system in Australia, who is regarded as an authority on this subject, in a recent letter to AMERICAN TELEPHONE JOURNAL writes as follows:

"Since the date of the article read by me before the St. Louis

Electrical Convention, our experience with the borers has continued pretty much as it was before. We have had trouble in the same districts, although not to the same extent. We have found that when the cables were brushed over with crude vaseline, the insects did not attack the cables. We have, however, found it advisable in the district in which the trouble was most marked to place the cables underground, so that the consideration of the aerial trouble, so far as this place is concerned, has practically disappeared. Of course, it is reasonable to expect that the efficacy of a coating of vaseline as a preventive against the attacks of these insects is determined by the length of time between the renewals of the vaseline. One of this department's officers who has had most experience in connection with this matter, considers that to coat the cables once a year would be sufficient.

"It is to be remembered that insects are most prevalent with us about the beginning of the wet season.

"It is further to be remembered that, as pointed out in my paper referred to, there are several kinds of insects which have a partiality for lead cables, and it is quite possible that the cure in one case would not be efficacious in another."

Developing the Iron Wire Ballast Switchboard

By C. D. Enochs.

ALTHOUGH telephone men have undoubtedly heard considerable in the last year regarding the use of iron wire ballasts in telephone circuits, it is doubtful if many realize that there have been private branch exchange boards of this type in operation for over a year, and that there has also been a main exchange switchboard of this type in operation for about thirteen months.

The village of New Brighton, situated about twelve miles northeast of Minneapolis, consists of approximately three or four hundred inhabitants, and is a busy center for the farming communities in the vicinity. In the last few years it has shown a very commendable spirit of growth, and both in business transacted and in point of inhabitance has proved to be a lively and energetic little city. With the prospect of the stockyards, which for a time have done little business, being revived, it is picking up to even a greater extent, and the telephone business in conjunction with the other business of the city looks promising.

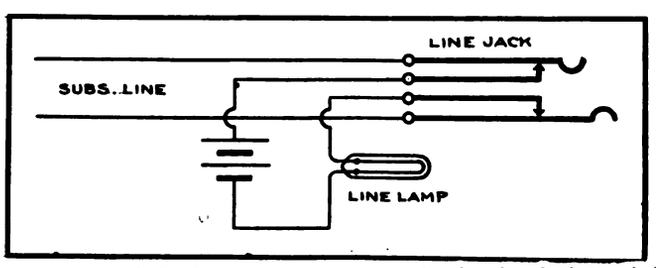

Fig. 1. Type of circuit for common battery calling found to be impractical on account of destruction of lamps.

The first telephone system was installed in New Brighton about six years ago, and consisted of the old magneto type manual restoring drops. About two years ago the manager, Mr. James, rewired his switchboard and telephones, so that the subscribers would get central office signalling and local battery talking service. This was accomplished by means of a passing contact in the telephones and a central battery common to the drops at the exchange. Last spring Mr. James decided that to keep up with the spirit of his village he must give the subscribers full common battery service. With the ordinary common battery systems known to the public this was impracticable, as an exchange with a present capacity of not more than forty lines could not afford the services of a repair man to take care of relay trouble. After considerable time was spent in investigating various types of switchboards, Mr. James found that with the iron wire ballast type of common battery board he could operate a common battery exchange under the conditions existing at New Brighton. The board was put in operation in April, 1906, with a set of dry batteries for power. It has been fully demonstrated to Mr. James's satisfaction that this type of board gives practically no trouble and can be operated economically on dry batteries. In fact, it will be shown in the following discussion of circuits that it is practically impossible for a board of this type to give trouble except from the ordinary wear on the switchboard cords.

In the ordinary common battery switchboard it has been found necessary to employ one or two relays to operate a small signal lamp that indicates to the operator a call is desired. It is self-evident that with all of the battery power located at the exchange, the simplest way to signal the operator would be to have his lamp in series with the exchange battery and subscribers' line. The operation of the subscriber's switch hook would control the opening and closing of this circuit and hence give the subscriber the means of signalling to the operator when a call was desired. The practical objection to this, which is one that until recently was impossible to overcome, was that if the battery voltage was sufficient to send current over a line situated several miles from the office to illuminate the line lamp, this same battery would burn out the line lamps on the subscribers' lines near the exchange. There were attempts at one time to overcome this difficulty by measuring the ohmic resistance of all the subscribers' lines and placing in series with the lamp resistances which would vary for the different lines, and which would make the resistance of all of the lines equal to that of the longest line. If everything worked properly on a system of this kind, it would be operative. However, it was found impracticable for the reason that the lines, which had in themselves a high ohmic resistance, would have no extra resistance added in series. If such a line should be short circuited through any cause near the exchange, or if the "live" (ungrounded) side of this line should be grounded near the exchange, the line lamp would be immediately burned out. An exchange of this type was actually tried by the Bell people in the city of St. Louis, and the result was that lamps were burned out each day, not by the dozen, but by the quart. The way in which the engineers finally overcame this defect in common battery systems was very ingenious and complicated. Instead of placing the line lamps in series with the line, as shown in sketches one and two, they placed the winding of a relay in the line circuit. When the subscriber removed his telephone, current was passed through the winding of this relay, causing it to operate. The operation of the relay would close its contact, thus illuminating the line lamp through the local circuit. Relays could be built which would operate over the lines of various lengths, and as the line lamps were all in local circuits, each received the same amount of current.

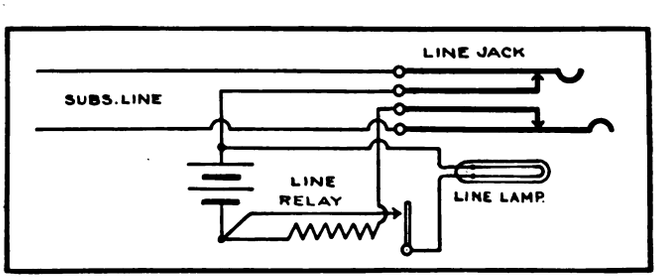

Fig. 2. Early type of line circuit showing method of protecting calling lamp by introducing a relay.

Digitized by Google

This, while a great improvement over the first attempts, necessarily introduced a new source of trouble in telephone exchanges; that is, relay adjustments. With the best type of relays possible to build, adjustment trouble is found to be a considerable part of maintenance expense. There are

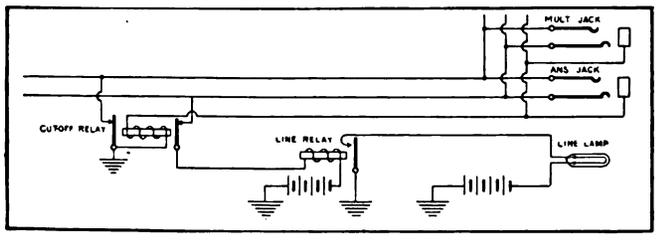

Fig. 3. Common battery circuit for multiple board, with line and cut-off relays.

hundreds of different causes which keep relays from operating, or which cause them to "freeze" when once operated. A relay must of necessity have at least one contact, and this contact becomes dirty from dust, and as the pressure produced by the armature on lines of extreme length is necessarily very light, an extremely small amount of dust will prevent the illumination of the line lamp even though the relay has operated.

Some designers of systems of the common battery type having become used to relays and considering relay trouble an unavoidable part of maintenance expense, added a second relay whose function was to remove the first relay from the line when the operator plugged into the subscriber's line jack. This second relay, which is termed the cut-off relay, brought in itself an increase of relay trouble, and hence maintenance expense. The system, however, was very ingenious, and with the aid of high priced help gave excellent satisfaction. Fig. 3 shows one of the well known circuits of this type, and aside from the maintenance expense it is found quite satisfactory. About a year and a half ago a new system was devised, which refused to consider any of the complications introduced in recent years and went straight back to primary principles. It started on the assumption that the ideal way of having and arranging a line circuit was to place the line lamp in series with the subscribers' lines. As this had been found impracticable only on account of the burning out of line lamps, the question was to protect in a positive manner the line lamp. The solution of this problem was found in the use of iron wire ballast. Iron wire ballast had been used for years in power work and in conjunction with the Nernst lamp. The action in conjunction with the Nernst lamp came the nearest to fulfilling telephone conditions, and deserves some little consideration. An iron wire of .002 inch in diameter is placed in series with the filament of a salt of a rare metal used in the Nernst lamp to protect this filament from fluctuations in voltage. The filament which is used is extremely sensitive to slight

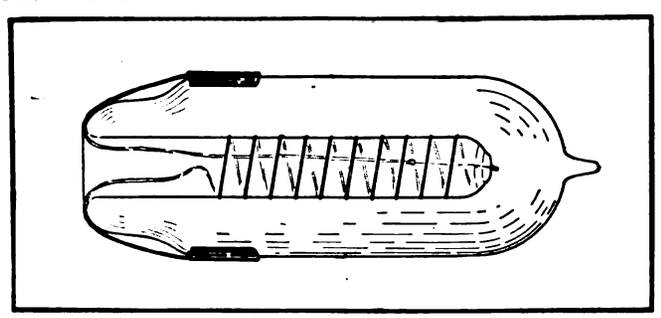

Fig. 4. Arrangement for mounting and protecting iron wire used to ballast telephone line.

variations in current. It has a negative co-efficient which has an extremely sharp curve at the point of best illumination. If placed on a power circuit without precaution a slight increase of voltage will cause an increment of current to be forced through the filament. This reduces the resistance of the filament, which will again allow more current to pass through. The result is that a variation of one and a half volts on a one hundred and ten volt circuit will burn out a Nernst lamp instantaneously unless the filament is protected. After a great deal of experimenting, the ballast already mentioned was designed and found to protect absolutely this extremely sensitive filament. As used by the Nernst Lamp Company, the iron wire is spiraled and held between porcelain discs, the whole being sealed in a glass bulb filled with hydrogen gas. For the purposes of the Nernst lamps, this ballast seems to leave nothing to be desired. With a variation of less than 10 per cent in current, the resistance of the ballast is increased or decreased 100 per cent, which will fully protect the illuminating filament.

When it was attempted to apply this same ballast to a telephone line, it was found that it failed for two reasons. First, the iron wire, on account of the presence of the hydrogen gas, radiated the heat so quickly that a current of .4 of an ampere was needed to heat it to a sufficient temperature for illumination. It is, of course, impracticable to send such a current out over a subscriber's line and impracticable to use such a current in a subscriber's lamp. The second reason for failure of this type of ballast was that a variation of 100 per cent was found to be insufficient to take care of the varying lengths of subscribers' lines. It was thought at first that this 100 per cent range could be easily increased by heating the wire to a higher temperature if the first objection could be overcome. Experiment proved, however, that when a ballast of this type was heated to a higher

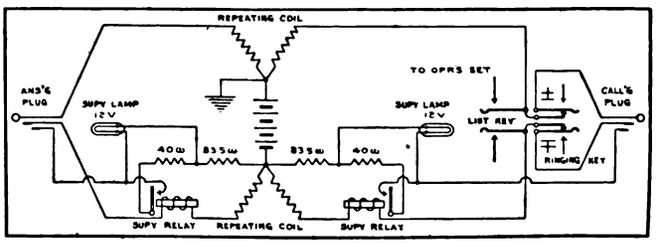

Fig. 5. One of the well-known types of cord circuits used with common battery relay line circuits.

temperature than it was designed to withstand, the wire became soft and the light spiral coils would collapse and pull apart from their own weight.

After considerable time was spent in both theoretical and practical investigation, it was found that if a wire .001 of an inch in diameter were sealed in a vacuum, it could be brought to the operating point by .07 of an ampere, which is normal current for a telephone signal lamp. Also, it was established that this current is easily sent over subscribers' lines of any practical length.

The next question to be solved was a means of mounting this wire so as to allow it to be heated to a high temperature, thus giving a greater range of variation of resistance. This was the hardest part of the problem, and was finally solved by the design of a ballast mount, as illustrated in Fig. 4. The inner tube of the ballast has a deep thread cut into the glass. The bottom and sides of this thread are purposely roughened. The fine iron wire is then wound in the thread and the whole sealed in the outer bulb, in which a vacuum is maintained. With a ballast of this style the wire is supported throughout its whole length, but on account of the roughness of the thread does not lie in intimate contact with the glass. In such a ballast the wire may be heated to so high a temperature that it becomes red and soft. The only result is that it droops down against the sides of the thread and remains thus supported. It is impossible for it to break of its own weight, as is the case with the Nernst type of ballast. After the perfecting of this piece of apparatus, it was found that a ballast was obtained that would give a variation of 1,000 per cent in its resistance with very slight increase of current. This, of course, is more than is needed

Digitized by Google

to offset the variation between the resistance of any practical telephone lines to subscribers' stations. With the question of the ballast solved, the line circuit was complete. The ballast line lamp, subscriber's line and power are all placed in series, as shown in Fig. 6. The ballasts for all subscribers' lines are exactly alike, no difference being made in long or short lines. The voltage of the battery is such that on a long line the current sent over the subscriber's line is sufficient to illuminate the line lamp. In this instance the ballast remains cold. When the ballast is in a subscriber's line of zero, or approximately zero resistance, the increment of current that is added on account of the difference in resistance of the lines is sufficient to increase the resistance of the line ballast approximately 700 per cent. On all commercial lengths of lines this means that the line lamp gets practically the same current, whether the subscriber's telephone is located in the exchange building or several miles distant.

With a line circuit thus doing away with all relays, it was decided that if the relays ordinarily used in the cord circuits were still employed, the battle would be only half won. One of the simplest cord circuits in operation up to this time is shown in Fig. 5. This contains only one relay, whose operation shunts out the operator's disconnect signal when a subscriber is talking. This relay, however, is subject to the same adjustment trouble as are the line and cut-off relays.

It took considerable time and trouble to design a supervisory circuit without a relay. The final design, however, was so absurdly simple that it appears as though it would have been the first idea to have been thought of. When an

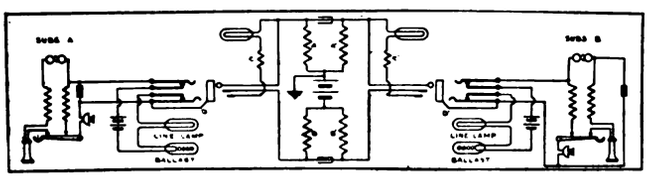

Fig. 6. Arrangement of circuits for connecting two subscribers through the board using iron wire ballasted signalling circuits.

operator's plug is inserted in a line jack, and the subscriber's telephone is removed from the hook, we have battery flowing through the cord to the subscriber's telephone and jack. If we place across this cord a signal lamp and an impedance coil to prevent the loss of voice currents, and design the resistance of the battery feed coils, the resistance of the lamp, and impedance correctly, it is evident that the subscriber's line loop will form a shunt on the supervisory lamp. If this supervisory lamp circuit is of sufficiently high resistance, it is evident that the resistance of the longest subscriber's line in practical use will be low enough to shunt out the supervisory lamp. When the subscriber's telephone is hung upon the hook the shunt is removed and the lamp receives its full current, giving the disconnect signal.

A combination of this circuit with the line circuit already described gives a switchboard of great simplicity. It will be seen that there are not only no moving parts anywhere in the system, but there are no contacts except where the signal lamp is cut off at the jack by the insertion of the plug. Moreover, for large exchange work, where a multiple is desired, the line circuit has been so modified in conjunction with the cord circuit that these contacts are done away with. In the larger boards there are absolutely no contacts whatever, except between the tip and ring of the plug and tip spring and ring spring of the jack. Any exchange man will realize the full significance of these simple facts. There can be no maintenance expense where there is nothing to adjust and no contacts to take care of.

In the case of the New Brighton exchange, where the power comes from dry cells, contacts in the keys are utilized to control the battery to the operator's transmitter, so that unless a connection is up and the subscriber is using the battery, or the operator's key is thrown to a listening position, no current whatever can be wasted. The result, as indicated by Mr. James's experience, is that for small exchanges that are not too busy, dry batteries, in conjunction with this type of board, are perfectly satisfactory. For the easier understanding of the combination of the line and cord circuits, they are printed together in Fig. 6, and the operation

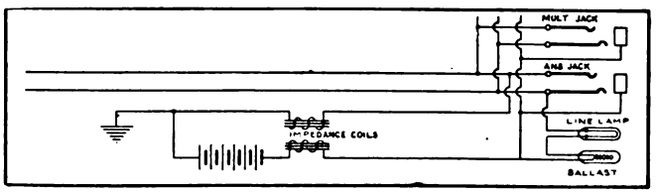

Fig. 7. Line circuit for multiple board, iron wire ballast type, without cut-off jacks.

is as follows: Subscriber A desires to talk with subscriber B. A removes his telephone and battery flows through the following circuit: Positive side of battery flows through the tact of jack to subscriber's line, through subscriber's instrument back on the second side of line to the second cut-off contact of jack through line signal lamp, through line ballast to battery.

Now the operator, seeing the illumination of the line lamp, places the answering plug in the jack corresponding to subscriber A's line. The insertion of the plug lifts the tip and ring spring from the cut-off contacts, hence removes battery lamp and ballast from the line. Battery for the subscriber's transmitter then flows from grounded side of battery through impedance coil A, through the key contacts, through the tip of the plug, tip spring of jack, subscriber's line, subscriber's instrument, second side of subscriber's line, to ring spring of jack, ring of plug, contact of key and impedance coil B to battery. The supervisory lamp, which is permanently attached to the tip of the plug, is connected through the impedance coil C to the sleeve of the plug. When the plug is inserted in the jack the sleeve of the plug is connected to the ring by the wire D in the line jack. As a subscriber's instrument shunts this supervisory lamp and impedance coil, the lamp is dark. The operator learns by inquiry that subscriber A desires to communicate with subscriber B and inserts the connecting plug into the line jack corresponding to the line of subscriber B and rings. Until B answers, we have battery flowing from grounded battery through impedance coil A', through key contact, tip of plug, through supervisory lamp, impedance coil C', sleeve of plug, sleeve of jack, ring spring of jack to ring of plug through contact of key impedance coil B' to battery. As this supervisory lamp has no shunt, it is illuminated, and when subscriber B takes his telephone from the hook and answers to the ring, the resistance of his line, including his set, shunts out the supervisory lamp. Both lamps then remain dark until the subscribers are through talking, when

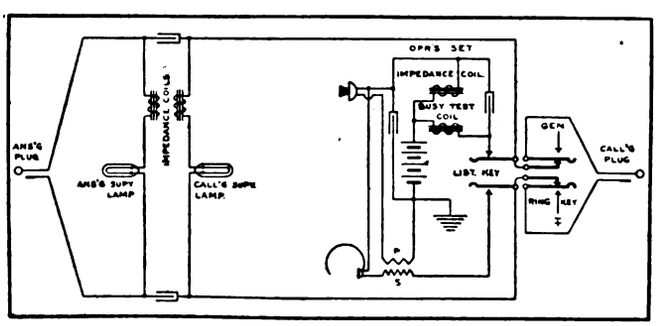

Fig. 8. Cord circuit for multiple board used with line circuit having no cut-off jacks, showing wiring of operator's set.

each lamp will be illuminated by the act of the subscribers hanging up their telephones, which removes the shunts from the corresponding supervisory signals, giving a disconnect signal to the operator.

As Things Look to the Editor

SETTING THE PACE.

ASK any Independent telephone man you please, on his return from a state convention, what subject came in for the greatest share of real attention, and you will probably get just one answer. That will be: "Building up the toll business." It is only within a comparatively short time that these men have come to realize that there was any chance to enter this field. There has been enough building from town to town to make a series of short trunk lines that, end to end, would stretch far enough to delight any person who can get a little pleasure from reeling off statistics. These statistical connections, however, never produce very heavy dividends. It is the kind of toll lines that people can talk over, and hear over, that pay. Having watched for some time the few thousand miles of such lines which are now at their disposal, and seen what good things they are to have, everyone has begun to feel a very urgent and lively desire for more and the best men in the field are now working diligently to get them built.

Before the companies were cemented together in firmly organized state associations, anything like a definite general movement in the line of improving long distance facilities seems to have been impossible. If it were desirable to do so, it would not be difficult to trace the reasons for this condition—such as the lack of that personal acquaintance which would inspire the necessary business confidence between possible associates, great lack of uniformity in equipment and methods of operating, lack of men sufficiently trained and experienced to view a whole field and determine its needs, lack of knowledge of proper mthods of handling interchanged business, and many other things.

As far as personal difficulties are concerned, the value of the work of state associations has by this time, in nearly all important sections of the country, made the men in charge of the affairs of the different companies familiar, in a general way, with the entire situation in a considerable territory surrounding the places in which they operate. They are thus in a position to judge of the needs of their subscribers, and to estimate the amount of communication which their business transactions would lead them to conduct by telephone with the places which may be put at their disposal. In other words, these telephone men know where toll lines should be built to be profitable, so far as conditions in other businesses than their own are concerned, and they know where local telephone systems have been sufficiently developed to furnish adequate connections to make them profitable feeders to a toll system. Of course, it has taken time to reach this condition, but even in the states which received a comparatively slow start in the upbuilding of Independent local systems, and telephone organization, this point seems at present to have been reached. They are in a position to profit by the knowledge gained in a few States which already have comprehensive toll systems.

With the needs of their territories, and prospects of a better paying business than exists under present conditions settled in their minds, it is only natural that they should be anxious to proceed to actual building at the earliest possible date. The principal obstructions in the way now, aside from the financial requirements, are lack of physical harmony which exists among the plants, and the lack of harmony in ideas as to standards of construction. In other words, it has come down to a simple engineering proposition.

It would be impracticable, and a very slow process, for a state association, for example, to engage an engineer to make a preliminary study of local conditions in each plant of the state, and plan for putting each system in the best possible position to co-operate with toll lines when they are finally built. He could only assume advisory duties, and his recommendations would not be backed by authority to carry any proposed changes into effect. It is for the managers themselves to take up the local questions which such a man would naturally consider, and see that by the time the long distance lines are built their exchanges are ready to handle calls with a minimum amount of trouble.

When modern standard switchboards and telephones are in use, the outside plant will require the most attention, and maintenance and construction factors become of the highest importance. Wire and cable for distribution need to be chosen and placed with the greatest care, in order that insulation may be kept up without effort on the part of the exchange forces after the lines have been built for some time, and a proper standard of transmission maintained. Methods of construction and instrument installation deserve also special care. When the toll lines are built, the companies with their plants in best condition from these standpoints of construction and maintenance will be in a good position to reap the reward from the start, while others will suffer a handicap which will be difficult to overcome, and may produce an undesirable effect upon the popular reputation of the entire toll service.

SPECIAL DIRECTORY SERVICE.

CARRYING out the idea of making the telephone directory a saver of time and effort to subscribers is in line with the whole purpose of telephone service. It therefore seems to be a highly legitimate field for the careful attention of the manager desirous of making his service of the highest value to the public. In cities where telephone development is high it is seldom indeed that a business man refers to a general directory, such as was formerly to be found in the office of every important firm. If a directory is kept at all, it is a classified directory of business houses; but for looking up addresses of known houses the telephone directory has come to be the natural book of reference. With a classified list of business firms included in this book as a supplement, the usefulness of any other directory seems almost to have passed away, and as telephone development becomes greater this will be more and more noticeable.

Of course, a natural question which will be asked is, "How is it to the advantage of a telephone company to furnish an amplified directory service when it is only paid for the use of its lines?" Probably several answers might be given to this. If figures could be obtained they would be likely to show that for every ten times a man looks up a name in the telephone book he substitutes one or two telephone messages for the letter he intended to send, the book thus tending to make him a more continuous user of the telephone lines. To the solicitor of contracts for telephone service who wants to show just what the telephone company is doing to make itself useful to the person he wishes to interest, the classified lists cannot fail to be helpful, and at all times the extra service may be considered a means of adding to the company's reputation for putting conveniences in the hands of its subscribers. This is always useful to the company when its affairs come up for general consideration by its patrons.

The principal objections raised against the classified directory relate to the questions of expense, and the possibility of the book becoming too cumbersome for convenience. Those in favor of the plan will point out that the insertion of proper advertising matter can undoubtedly be made to offset the additional cost, while if the classified lists eventually make the book too cumbersome for convenience, the subscribers will readily consent to their omission.

The plans worked out by Mr. Johnston, and described in this issue, offer some very interesting suggestions as to the actual methods to be pursued in making a good directory along these lines. Putting the rural lines under a printed notice which practically puts them in a separate business classification, in accordance with a general plan which was explained at considerable length in an article we published some time ago, seems to be a wholly new idea, and one worthy of considerable attention.

Legal Snares Untangled

CONDUCTED BY A. H. McMILLAN.

TRIMMING TREES ALONG MARGIN OF HIGHWAYS.

In a recent issue of your valued paper, the writer noticed a decision through which the court held that trees located on curbstones, or on the edge of public roads, could be trimmed by telephone and telegraph companies to clear their wires, as they were public service corporations, and damages could not be recovered for such trimming.

Will you kindly advise through your paper what decision this was?

The writer would also like to know of any decision in Tennessee or Kentucky in reference to the right of telephone companies to trim trees on the streets or public highways in the State. Also what rights we have to trim trees on private property, projecting over the street or roads.—R. H. P.

THE decision above referred to is that of Hobbs vs. Long Distance Telephone and Telegraph Company, 4 S. 1003, in which it was held that the telephone company in Alabama might lawfully trim trees "along the margin of the public highway."

A Tennessee case upon the subject is Memphis Telephone Company vs. Hunt, 16 Lea, 456, 457 Am. Rep. 237. In that case suit was brought to recover damages from the telephone company for entering upon the premises of the plaintiff at 12 or 1 o'clock at night and cutting certain limbs of trees growing in her yard in the City of Memphis. She had refused to give the employees of the company permission to cut the limbs specified, so the act was done in this unusual manner. The company had been given authority by public officials to construct its line over the street and also to cut away limbs overhanging the streets and sidewalks that might interfere with the construction and operation of its line. The company was to pay any damage incurred, and the permission obtained from the public officials gave only the right of way on the street and not over private property. The court held that the company had no right to enter on the property to trim the trees, although the limbs of the trees projected over the sidewalk.

A RISK NOT ASSUMED BY EMPLOYEE.

THE crossing of wires outside of a building in which a man was working as engineer in charge of a machine, causing a powerful current of electricity to be diverted and brought into the building on wires not intended to carry such a current is not one of the ordinary and usual incidents connected with the engineer's employment, and is, therefore, not assumed by him. This was the ruling of the Illinois Court of Appeals in a case brought by the representatives of an engineer who was killed by the heavy current of electricity. Belvedere Gas & Electric Co. vs. Boyer, 122 Ill. App., 262.

TRIMMING TREES IN INDIANA.

Please let us know through "The Telephone in the Courts" what the law is in this State in regard to telephone companies trimming trees over which its wires pass. This is a special case. This company built a forty foot pole line along a street, going above all trees, and now one party's trees are just to our wires, we using two arms. He says that we can't cut his trees. The trees are on the curb line. This company is operating under a franchise. There is no alley to run our lead on. K. B. D.

IT is the law in Indiana that poles may be erected in the public streets for the purpose of operating a general telephone system without the consent of the adjacent property holders, and without making compensation to them. Magee vs. Overshirer, 150 Ind., 127; 49 N. E., 951. From this it follows that property owners cannot object to telephone companies trimming trees that stand in the highway, as we understand is the situation in the case above referred to.

DAMAGES TO WHICH ABUTTING OWNER IS ENTITLED.

ACTION was brought against the Bell Telephone Company of Philadelphia by the owner of abutting property to recover damages for interference with the light, air, access to and drainage of his property. The court held that where telephone poles and wires erected in streets under charter rights with municipal consent appreciably interfere with light, air, access and drainage, such interference is an additional burden to which the land of the abutting owner cannot be subjected without rendering to him just compensation. The pole to which the property owner particularly objected was a distributing pole six inches in diameter, and planted opposite an alley at a point between nine and ten feet distant from the house line. By reason of the pole, it was impossible for the owner to take long pieces of timber and lumber from the alley for the purpose of making repairs and alterations, and for this injury the owner was allowed damages. As to the specific amount of loss caused by injury to drainage there was held to be no evidence other than that the water backed into the plaintiff's cellar and the pole was erected within about eight inches of the drain, without anything to show the connection between the two conditions. The court held that the erection of the poles in the streets in conformity to municipal regulations was not in itself an additional burden upon the property. Shinzell vs. Bell Telephone Company of Philadelphia, 31 Pa. Super. Ct., 221.

A TRESSPASSER ON STREETS OF OWENSBORO, KY.

IN the case of the Kentucky and Indiana Telephone and Telegraph Company against the Rural Home Telephone Company, an amended answer was filed by the Rural Home Company in which it sets out that the Kentucky and Indiana company has never been granted any franchise by the city of Owensboro, Ky., and it is, therefore, alleged that "plaintiff did not have, at the time of the filing of its petition herein, and never has had any right, power or authority to do business as a telephone company in Owensboro, or own or operate a telephone plant or exchange in said city or to contract to furnish telephone connections or service to persons in Owensboro."

It is further stated that it had no power to enter into any contract with defendant company for telephone service between subscribers to the two systems of these companies.

It is claimed that ordinances purporting to give a franchise to the Owensboro Harrison Telephone Company, the assignor of the Kentucky and Indiana company, are void because violating that section of the constitution which provides that a city shall not be authorized to grant a telephone company any franchise for a longer term than twenty years and providing that all franchises must be sold by all cities, after due advertisement of the intended sale thereof, to the highest and best bidder.

VERBAL CONTRACT FOR TELEPHONE SERVICE WILL NOT BE SPECIFICALLY ENFORCED.

SPECIFIC enforcement of a contract is a remedy granted by courts of equity by which they make an order that a party to a contract must carry out its provisions under penalty of being considered in contempt of court. It will be seen that this is in many cases a much more comprehensive and satisfactory remedy than a mere suit for damages for the breach of a contract. It has recently been held that a verbal contract to furnish telephone service at a specified rate will not be specifically enforced notwithstanding the fact that, in consideration of such agreement, the plaintiff had rendered services and made a contribution in connection with the establishment of a telephone system.

The ground on which the above decision rests is that the contract is not within the Statute of Frauds, which is a law requiring every contract that, by its terms, is not to be performed within a year from the making of it, to be in writing. It was contended by the complainant that the rendering of services and making of a contribution constituted a part performance of the contract that rendered it unnecessary to have it in writing, but with this contention the court did not agree. Quinn vs. Stark County Telephone Co., 122 Ill., App., 133.

The How and Why

LOCATING A CROSS WITH OHMMETER.—(868.)

We have an ohmmeter similar to the one described in the JOURNAL some time ago and would like very much to have you describe to us the method of locating the distance of a cross away from the exchange when no other wires than those crossed are available for testing. A. H. J., Missouri.

Providing that the cross is between wires that run parallel in the same direction from the exchange and are of the same size, all that is necessary to determine the distance of the cross from the exchange is to determine the resistance of the circuit formed by the line wires to the cross and back to the exchange. To do this you will attach your line wires to the binding posts A and B on your ohmmeter and test for the resistance. This is

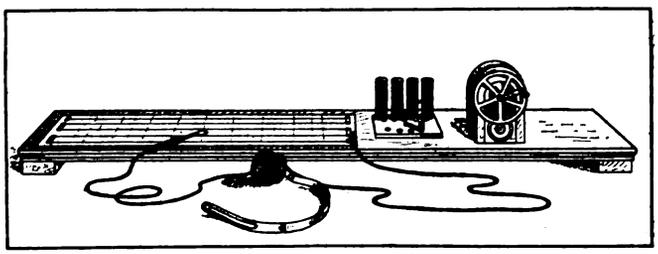

Fig. 868a.

accomplished by first placing the receiver to the ear, turn the crank of the generator, take the free terminal of the receiver which has the knife edged feeler, and pass it to and fro over the resistance wire until a point on the resistance wire is found at which the receiver becomes quiet and the throbbing of the generator cannot be heard. Having the ohmmeter scales as shown in Figure 868*b*, and as a concrete example assume that the switch lever is on the one hundred ohm coil, and that the receiver terminal stands at 300 upon the resistance scale, the total length of the scale is 500 divisions, the standard coil is 100 ohms. Then the resistance of the circuit formed by your two wires to the cross and back we will designate by X. Then the following equation holds true:

$$X = \frac{300}{200} \times 100 = 150 \text{ ohms}$$

In other words, divide the number on the scale opposite which the receiver contact stands, by the difference between this number and the full reading of the scale. Thus, the neutral point was 300, the whole length of the scale being 500, 500—300=200; then 300÷200=1½, which multiplied by the resistance of the standard coil, 100, gives as a result 150 ohms. This test gives you the resistance of the wires to and from the cross, which, divided by two, will give the resistance to the cross. Then knowing the resistance in ohms and the size of your wire the distance in feet may be readily ascertained by reference to the accompanying tables, which show the approximate resistance of iron and copper wires.

LIMIT FOR FREE SERVICE ON RURAL LINES.—(869.)

We have rural lines radiating from our central to a distance of 20 miles or more. Town business subscribers as well as rural subscribers have at present the free use of all our lines; others pay toll while using our rural lines.

We are about to still further extend our lines. Now, regarding distance, etc., a line has to be drawn somewhere as to what free service may properly be granted the different subscribers. We should like very much to hear from telephone men who have worked out of this difficulty in a satisfactory way. UNINITIATED, Canada.

This question of the limits for free service has probably received as much thought and discussion at meetings of telephone men as any problem confronting operators of rural lines. The Editor would like to see the men who have come to some conclusion which appears satisfactory to them send in their experiences for the benefit of the present inquirer and others.

CAPACITY OF SWITCHBOARDS.—(870.)

We have been having an argument as to the size possible to construct common battery multiple switchboards and would very much appreciate having you inform us as to the largest possible board of this size. Also kindly explain what is meant by the term "divided multiple." F. F., Michigan.

By the use of the smallest jacks at present manufactured it is possible to construct an ordinary multiple switchboard of the common battery type which will be able to accommodate up to twenty thousand lines in extreme cases. A board of greater capacity than this would be very unwieldy, owing to the size and the distances the operators would have to reach in making connections. In exchanges where boards of a greater capacity than this are necessary, other arrangements are adopted. However, under the best of these arrangements, the chief of which are the divided multiple and transfer systems, the system suffers many disadvantages over the straight multiple.

AVERAGE WEIGHT AND RESISTANCE OF IRON WIRE.

14	96	48.96	57.29	67.71

Table 868d.

The "divided multiple," or "divided board" system, as it is more often termed, is one in which each subscriber is provided with two or more distinct means of signaling the exchange.

At the exchange the lines are divided into a corresponding number of sets to form separate boards or sections—lines of numbers up to, say, 20,000 being allotted to an *A* division, those from 20,000 to 40,000 to a *B* division, etc., according to the number of divisions.

Each of these sections is provided with a calling signal and answering jack for every line in the exchange, but only those allotted to a division are multiplied on that division. Any subscriber can thus call on any one of the divisions of the board, but

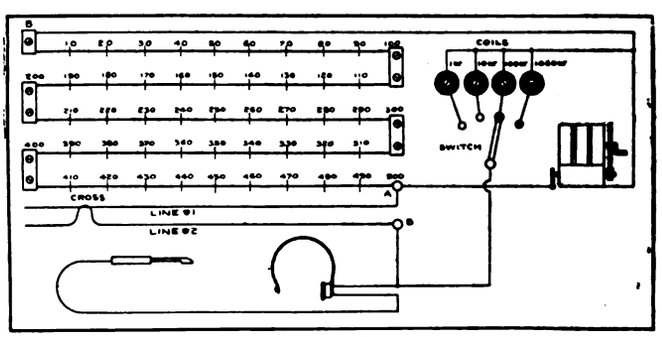

Fig. 868b.

is only called up on some one division depending upon his number. When he wishes to call a subscriber he looks up the number and then makes the proper adjustment of his instrument, so as to give the signal on the special section of the exchange to which the number he desires is allotted.

Making a Telephone Directory for Business Men

The Story of a Directory Arranged to Make Its List of Names Emphasize the Time-Saving, Business-Aiding Value of the Telephone Service

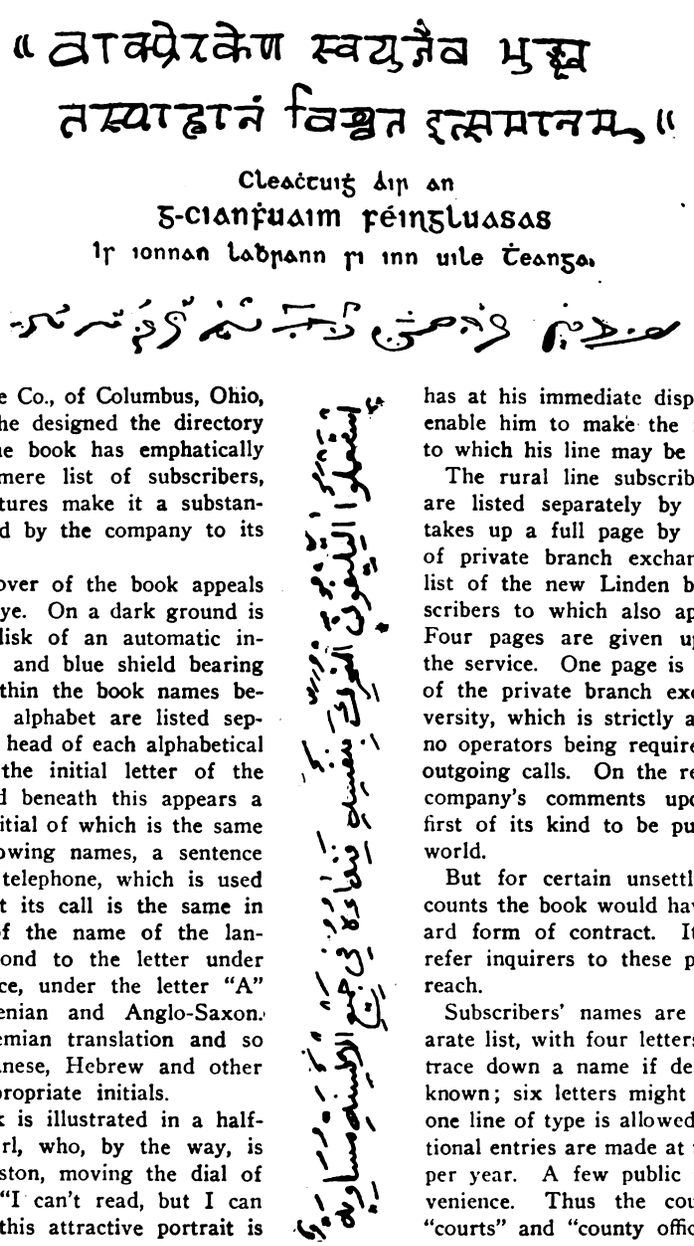
By L. A. Parrish.

SAVING time and effort to its patrons is the reason for a telephone company's existence. Its service is one which embodies in a pre-eminent degree the qualities of speed and convenience for the user. If the instruments and the central office are designed to cut down waste of effort by the patron to a minimum, why not go a step further and save his time when looking up a number in the directory? If he uses the telephone to get in touch with different people for transacting business speedily, why not let the directory, as well as the line, help him attain his object? Gansey R. Johnston, general manager of the Columbus Citizens' Telephone Co., of Columbus, Ohio, had these ideas in mind when he designed the directory used by his subscribers, and the book has emphatically "made good." More than a mere list of subscribers, its novel and useful special features make it a substantial part of the service rendered by the company to its patrons.

Striking in appearance, the cover of the book appeals forcefully yet pleasantly to the eye. On a dark ground is printed in bronze the calling disk of an automatic instrument, encircling a red, gray and blue shield bearing the name of the company. Within the book names beginning with each letter of the alphabet are listed separately, as is customary. At the head of each alphabetical division appears in bold type the initial letter of the names in the following list, and beneath this appears a sentence in some language the initial of which is the same as the initial letter of the following names, a sentence that recommends the automatic telephone, which is used by the company, and states that its call is the same in every language. The initials of the name of the languages in other words correspond to the letter under which they appear. For instance, under the letter "A" appears the sentence in Armenian and Anglo-Saxon. Under the letter "B" the Bohemian translation and so on. Sentences in Chinese, Japanese, Hebrew and other languages appear under the appropriate initials.

A related feature of the work is illustrated in a half-tone print of a five-year-old girl, who, by the way, is the little daughter of Mr. Johnston, moving the dial of a desk set which is labeled, "I can't read, but I can count." As a decorative piece this attractive portrait is balanced by a view of a smaller child holding a receiver and saying, "I can't count, but I can talk."

In the opening and closing pages of the book the company has taken unusual pains to explain and comment upon its service, giving a page to instructions relating to the automatic telephone, one to general rules and courtesies, one to the information bureau and the trouble department, one regarding the directory and its methods of compilation, with suggestions as to its use; pages relating to the United States Telephone Company's long distance service and to the county service which is handled through the long distance department. In the Franklin county department the business telephones and the toll stations on the fourteen county exchanges are given, but not the farmer lines and residence telephones. With this is a conventionalized map of the county toll lines. Under this plan each subscriber has at his immediate disposal all information required to enable him to make the fullest use of the entire system to which his line may be connected.



Sentences in Vedic, Gaelic, Persian, Arabic, Esperanto, Turkish and Bohemian Appearing Beneath Alphabetical Index Letters in the Directory.

The rural line subscribers on the Columbus exchange are listed separately by lines and the pay station list takes up a full page by itself. There is a separate list of private branch exchange subscribers and a separate list of the new Linden branch exchange, names of subscribers to which also appear in the body of the book. Four pages are given up to pictures and remarks on the service. One page is required to show the telephones of the private branch exchange of the Ohio State University, which is strictly automatic in its entire operation, no operators being required either for its incoming or its outgoing calls. On the reverse side of this page are the company's comments upon this service, which is the first of its kind to be put in operation anywhere in the world.

But for certain unsettled questions in rates and discounts the book would have had a rate sheet and a standard form of contract. It is frequently advantageous to refer inquirers to these pages, which are always in easy reach.

Subscribers' names are numerically arranged in a separate list, with four letters of the name given sufficient to trace down a name if desired, when only the number is known; six letters might be better. In the classified list one line of type is allowed each business main line. Additional entries are made at the extra name service rate of $6 per year. A few public places are listed twice for convenience. Thus the county courts are classed under "courts" and "county offices." Churches, charitable institutions and lodges are given business classification, but pay only residence rates, and ministers' residences are classified. Physicians' residences are also classified when they have both business and residence telephones.

The classified list is as concise as possible, with two columns to

Digitized by Google

the page. Practically all addresses are omitted, but those subscribers having two or more trunk lines are offered the benefit of a distinction between their different numbers, as by different addresses, or by "office" or "factory" and the like. The cost of including the classified list is comparatively low, and is largely paid by the extra name service charges it influences.

After the private branch exchange names in the classified list appears the designation "P. B. Ex." To indicate more than one line in the rotary group, in which the switch on a single call automatically selects the first trunk not busy, the lowest number is followed by a "+" sign, as 8144+, for the subscriber who is connected to the lines 8144-45-46-47. In the alphabetical list a single one line entry is allowed for each main line telephone; nothing for extension telephones. The type is set solid across the page. The only specially distinguishing type used except for the fire and police calls and information and trouble numbers, is reserved for the private branch exchanges, which are given a heading in capitals and as a rule have their stations listed. With 55 such exchanges scattered through its pages there is almost an even chance of finding one at any opening of the book. Interior or intercommunicating sets are not dignified as private branch exchanges.

In this book for the first time is introduced an "extra number" service. This consists of inserting "Office No. —" on the same line with the residence listing, or vice versa, at $3 per year.

One of the Illustrations of a Youthful Telephone User.

The paper in the book is of first quality 60-pound litho-super; the type and the press work are of the best. The telephone numbers are in extra legible heavy faced type. The preceding directory was so expensive that it became necessary to reduce the cost either by the use of cheaper press work and poorer paper, or the omission of one or more of the special lists, or the introduction of advertisements.

While there is some sentiment against advertisements in a telephone directory, it was reasoned that the public would pre-

LONG DISTANCE SERVICE

Columbus has the largest toll board in the independent telephone field. Franklin County business alone employs seven operators; other long-distance business forty operators. Nearly eighty thousand messages a month are now handled from, to and through Columbus, or almost double the number possible to handle with the old equipment. More than two hundred and fifty thousand telephones are reached in Ohio alone. To Franklin County points radiate twenty-four toll lines with twenty four additional branches. A network of independent lines covers Ohio almost as thoroughly. One movement of the automatic dial puts a signal before a long-distance operator.

Company's Advertisement of Long Distance Service at Foot of Directory Page.

fer a first quality book with advertisements to a second quality book without advertisements. The advertisements have been confined to the lower quarter of the right hand pages, nothing appearing as top, bottom or margin lines. No heavy faced type is permitted in the body of the book to give one subscriber

Rural Lines

Most of the persons named in this list are farmers, and most of these farmers have produce to sell to dealers or consumers in Columbus—potatoes, apples, berries, poultry, eggs, butter, hay, grain, live stock, and so on. Many of them also have stands in Columbus markets. Many buy and sell horses and take them for pasture. Altogether they serve the residents of Columbus in more ways than we can here enumerate. At this time the telephone company has no list of those prepared to fill telephone orders, but there seems to be no reason why trade may not be greatly facilitated between producers and consumers of farm produce in Franklin County by the more frequent use of the telephone.

NOTE.—The heavy number (as 99103) refers to the automatic call, and the smaller figures the number of rings on the line.

being distributed. Each quarter page of advertisement was charged at $12.50. When the company's officers were planning the issue numerous directory and other canvassers tried to control it. They made all sorts of offers for the privilege of

Digitized by Google

publishing it. Some offered to print and publish it without expense to the company; others offered to take it on commission, while a few even offered a bonus. The officers did not wish to have subscribers persistently solicited for advertising matter and accordingly one of the company's employes simply presented the opportunity to take the space if desired. No objection was raised to the insertion of Bell telephone numbers in advertisements. Advertisements were accepted only from subscribers for business telephones. Under this plan only about 75 advertisers were found for this first edition to fill the 150 spaces reserved for advertising, care being taken to eliminate all objectionable matter. To fill the remaining space some advertisers were given as a premium two spaces for the price of one and with that several advertisements of the Columbus Citizens' Telephone Company itself were inserted. There is

that can be reached. Particularly on long distance calls, don't refrain from trying because the person or business you seek is not listed when you look. Ask, and in asking give all the information you can—name, business, street location and all."

Companion Illustration—Calling a Number.

Except as they are given in courtesy, it is the practice to sell the directories at cost to county exchange subscribers and to non-subscribers generally. The Columbus company will be pleased to exchange directories with other telephone companies of corresponding size.

Digitized by Google

The manager's office has a file of all the essential parts of other directories, retaining the pages which have striking ideas or new forms for future study and reference. The advertisements and covers are also filed.

The present directory is regarded as a model book by all telephone men to whom it has been referred, and is an extremely valuable ready reference directory to the business men of Columbus.

Flat Rates vs. Measured Service*

ABSTRACT FROM THE REPORT OF THE SPECIAL COMMITTEE OF TELEPHONE EXPERTS APPOINTED BY THE CITY COUNCIL OF CHICAGO.

WE think the Chicago Telephone Company has involved itself in considerable unnecessary expense by apparently encouraging subscribers to make calls upon operators for various items of information. The record of a count made in November, 1906, shows that more than 42,000 requests for the "time of day" were made of the operators on that day. The expense of this service would go far toward keeping the subscribers who asked the time of day supplied with clocks; and various other much repeated enquiries apparently aggregate an equal expense.

In further illustration of the relation of the number of calls made per telephone by different users, we have had some additional charts made from the data which we have gathered together.

Chart No. 7 shows the number of flat rate lines and the number of measured rate lines in the Chicago exchange district. The flat rate lines include what are known as commutation trunk lines, namely, lines from private branch exchanges which are used for outgoing messages only; and the measured rate lines do not include the ten-party lines, which we have put upon a separate chart (No. 10). It will be observed that the number of measured rate lines is rapidly increasing compared with the number of flat rate lines.

Chart No. 8 shows the total number of calls per day originating from the flat rate telephones and from the measured rate telephones connected with the lines illustrated in chart No. 7.

Chart No. 9 shows the average numbers of daily calls per line and per telephone on the flat rate lines and on the measured rate lines which are illustrated in chart No. 7; and this chart indicates the large difference which exists between the two kinds of service now current in Chicago in respect to the number of calls per line or per telephone per day. The average number of calls per line on the flat rate lines is steadily increasing, thus increasing the annual expense to the telephone company per line, though the price charged to the flat rate subscribers remains independent of the use of the telephones. The numbers of calls per line and per telephone on the measured rate lines show different characteristics. The number of calls per telephone per day is steadily decreasing toward an apparent minimum limit of approximately six calls per telephone per day, thus decreasing the cost to the telephone company and making it possible to make marked reductions in the average price per telephone.

Chart No. 10 shows the number of ten-party telephones, the

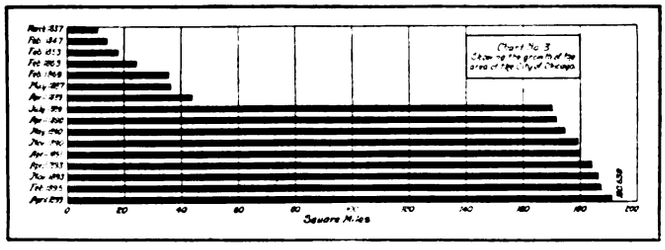

Chart No. 3.

total number of calls per day originating from these ten-party telephones, and the average number of calls made daily per telephone. This shows that in this service the number of calls made daily per telephone is remarkably low, and the price of this service may properly be made correspondingly low.

There is another feature which relates to the question of relative use by flat rate and measured rate users of telephones. It is impracticable to connect all telephone subscribers in a great exchange system, such as is found in Chicago, with a

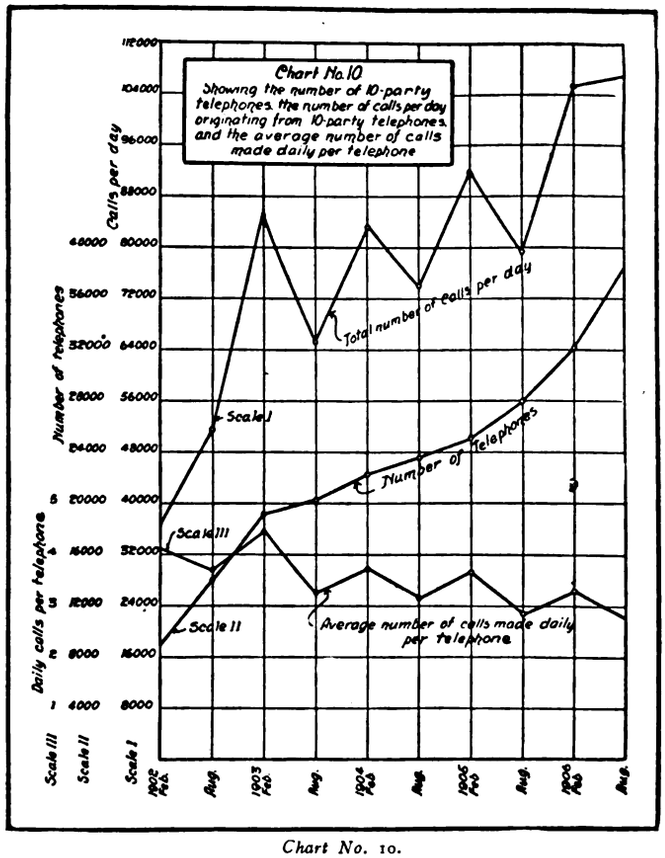

Chart No. 10.

single office, and it becomes necessary to arrange means for transferring calls made by lines in one office to the called-for subscribers' lines in other offices. This is ordinarily denominated "trunking" the calls between the offices, and it involves a double expense for operators, since one operator is required to receive the call of the subscriber at the originating office and another operator is required to complete the connection to the called subscriber's line in the second office. As the system increases in number of telephones, the proportion of "trunked" calls is likely to increase. We have illustrated this in connection with our Chart No. 15, which shows the way in which the "trunked" calls, marked "B calls" on the chart, increase as the service extends. This chart No. 15 shows the daily number of "B calls" according to the "peg counts" of February and August for a number of years back, and it will be observed that the number of "B calls" consistently increased during this period. This chart also shows the number of measured rate calls originating from subscribers' lines and the number of flat rate calls originating from subscribers' lines, and it will be observed that the number of flat rate calls has increased year by year at a rate approximately equal to the increase of calls from measured lines, although our chart No. 7 shows that the number of flat rate lines has not been increasing as rapidly as the measured rate lines. Chart No. 15 also shows that the rate at which "B calls" or "trunked" calls increase corresponds more nearly to the rate at which the flat rate calls increase in number than to the rate at which the measured rate calls increase.

*Continued from the issues of May 11 and 18, in which a number of charts referred to for the second time in this issue will be found.

The indications that are afforded by chart No. 15 are likewise afforded by the series of load curves which we have given. We have plotted the load curves for the "peg count" taken on August 3, 1906, in all the telephone exchange offices of the city, giving separate curves representing the measured rate calls, the flat rate calls, and the incoming trunked or "B calls" for each exchange. We have also given a line showing the sum of

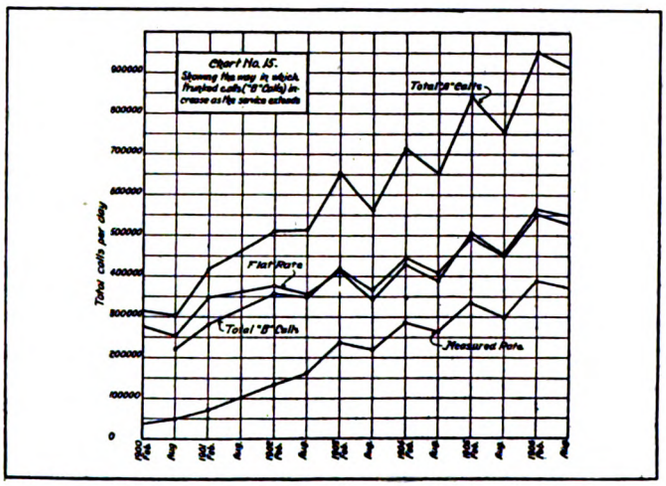

Chart No. 15.

the measured rate and flat rate calls for each exchange on that day. The Chicago Telephone Company makes a "peg count," as heretofore indicated, once a month, and we have given the load curves for the "peg count" for one month, taken at random.

Load curve No. 9 gives the sum of the calls obtained from the several exchange offices in the Chicago exchange district. The curves are shown as the total number of calls originating on all the subscribers' lines (marked "A" calls) on August 3, 1906, during each hour of the day, the total number of measured rate calls during each hour of the day, the total number of flat rate calls during each hour of the day, and the total number of "trunked" or "B" calls coming in to all of the exchange offices during each hour of the day. A point on each of these curves indicates the number of calls of the particular class during the corresponding hour of the day. The indication of "B" calls on the load curves for the several separate exchange offices does not afford any means of telling from what sort of a line the original calls emanated, because records of the trunked calls are only made at the receiving office, while the sending office (where the "B" call is not recorded) is the only one which could determine from what sort of a line a trunked call emanates. But the total load curve makes it possible to compare the total trunked calls with the total flat rate and the total message rate calls, and it will be observed that the number of trunked calls corresponds closely to the number of flat rate calls. This is probably an indication that the greater proportion of the trunked calls come from the flat rate lines, and that these lines are consequently causing more than a proportional share of the double expense of the trunked calls.

In passing, we will call attention to the complexity of the service indicated by these load curves. It will be noticed that the load curve for Harrison exchange, which is in the business portion of the city, and is typical of the load curves at Main, Central and Harrison exchanges, shows extended peaks of traffic; that is, it shows a very large number of calls at a particular hour, about 11 o'clock in the morning, and that business falls off rapidly on either side of the peak. There is another peak in the afternoon in each of these exchanges. In some exchanges there comes a relatively high peak between seven and nine o'clock in the evening, apparently due to the demands of social intercourse between the families of subscribers.

These great variations in the hourly use of the telephone increase in a marked degree the cost per message for operating, because the telephone company must always have sufficient operators on hand to meet the requirements of the hour, and must have a sufficiently large switchboard to enable it to handle all the calls which arrive at the busiest hour. Even with the best arranged schedule for the operators' work, it is impracticable to arrange for operators to be on hand for only one or two hours in the morning and one or two hours in the afternoon, but the operators must be put at work for a considerable number of hours at a time, so that the irregularities of the load curves which run up into high peaks increase the cost of operating on account of increasing the average number of operators that must be kept on duty in proportion to the total number of calls per day, and also increase the cost for interest and maintenance on account of the extra switchboard positions required to enable these extra operators to perform their work.

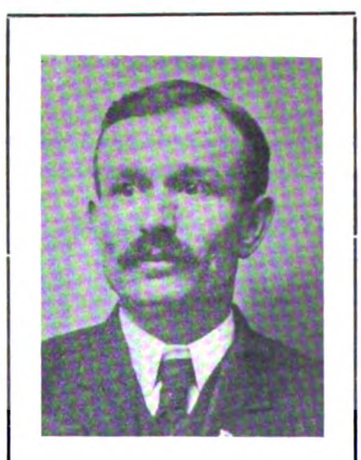
A scrutiny of the load curves of the various exchange offices and especially of the business offices, indicates that the greatest proportion of the peak of the load in each exchange office comes from the flat rate users, and that the measured rate curve is more uniform over the period of the day. This absence of peak makes it possible to perform the telephone service more economically, and the present measured rate users are therefore less expensive users to whom to supply service. A measure of the expense of the operating is to some degree indicated by the ratio of the maximum number of calls in the busy hour to the total number of calls per day in the exchange. This ratio is larger for the flat rate calls than for the measured rate calls in the Chicago exchange district. As shown by the twelve "peg counts" for 1906, the average ratio for the total number of originating calls is .1072, the ratio for the flat rate calls is .1185, and the ratio for all measured rate calls, including ten-party lines, is .0991, which indicates that the cost of operating for the measured rate calls is less than the cost of operating for the flat rate calls. Other peg counts show similar results.

Service inspection tests from the New York city exchanges, which are operated almost entirely on the measured service basis, show that the proportion of unavailing calls there is only about one-sixth of the total calls, and that the proportion of calls receiving busy reports is one-twelfth of the total calls. A comparison of peg counts for these two exchange systems indicates that the expense for traffic employes per station is lower in New York than in Chicago, and we conclude that this difference must be due to the measured rate method of charging.

(To be concluded.)

THE VIRGINIA CONVENTION.

COMPANIES from all over the State of Virginia were represented at the recent convention of the Virginia Independent Telephone Association, held at Norfolk, on May 21. Matters of general interest to operating men were taken up, and much benefit was derived from their discussion in detail. Papers were read by a number of prominent members dealing with the question of rates, franchises and various other matters of general or special interest at this time.



B. L. Fisher, Re-elected Secretary and Treasurer.

The matter of developing the long distance business of the State, and arranging for the putting up of toll circuits to connect the exchanges of the different companies, with lines built according to the best modern standards, was given lengthy consideration. A committee appointed by the president will take this matter up in detail, and work out plans for the building of such lines as will best meet the needs of the several operators. A report of this committee will be presented at the second meeting, which is to be held in Norfolk within the next few months.

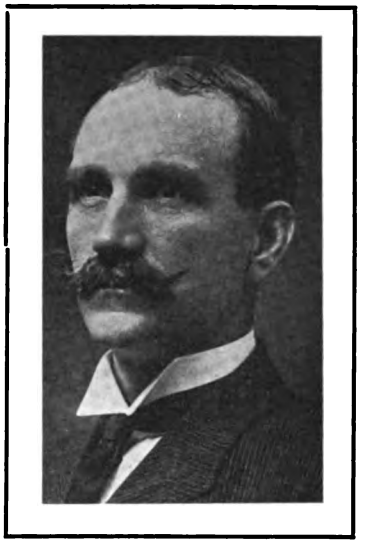
One of the minor matters discussed related to the stationery to be used by members. It was decided that in connection with the use of the shield on letterheads and envelopes, it should also be stated that the companies which belong to the Association should print a line stating that they are members. After the presentation of papers, and a discussion of the various business matters mentioned, the Association proceeded to the election of officers, and those who have served during the past year were chosen without exception to carry on their duties through new terms. The officers of the Association are: President, Albert Parlett, Bristol; first vice-president, F. F. Marbury, Alexandria; second vice-president, W. N. McAnge, Suffolk; secretary and treasurer, B. L. Fisher, Rocky Mount; executive committee, C. Fred Bonney, Norfolk; Geo. B. Keezel, Keezeltown; Albert Parlett, Bristol; W. N. McAnge, Suffolk; F. W. Davie, Lawrenceville. Mr. W. N. McAnge was appointed delegate, and F. W. Davie, of Lawrenceville, alternate, to the convention at Chicago.



W. N. McAnge, 2d Vice-President, Who Took a Leading Part in Toll Line Discussion.

Members from various parts of the State reported very satisfactory conditions of growth and development, and a number of telephone men who have not heretofore co-operated officially with the Association were elected to membership.

CONVENTION OF MICHIGAN INDEPENDENT TELEPHONE MANAGERS' ASSOCIATION.

ON May 8-9 the second semi-annual convention of the Independent Telephone Managers' Association of Michigan, in Owosso, was attended by one hundred and three ladies and gentlemen from operating departments of telephone companies in various parts of the State.

The following program was carried out as outlined, with the exception of the paper, "Through Business," by Mr. B. L. Carson, of Bay City, who was unable to be present.

Address of welcome, Hon. D. H. Lamb, Mayor of Owosso; opening address, Mr. F. V. Newman, President of the Association.

THE OPERATING ROOM.

"The Chief Operator," Miss Margaret Heney, chief operator, Owosso; Discipline and deportment of operators, Miss Fannie Hiddie, chief operator, Grand Rapids; Information department, Miss Amelia Kowlski, chief operator, Ann Arbor; the merit system with operators, Mr. C. E. Smith, manager, Cadillac; Service reports, Mr. H. W. Sexton, wire chief, Owosso.

EVENING SESSION.

Dinner at hall for delegates and invited guests; dinner followed by social hour; address, Hon. S. E. Parkill, Owosso; Mr. Charles E. Tarte, Toastmaster.

SECOND DAY—TOLL WORK.

Through business, Mr. B. L. Carson, manager, Bay City; General handling of toll business, Miss Inez E. Close, manager, Pontiac; Following up unfinished toll tickets, Mrs. Florence R. Gould, chief operator, Battle Creek; Co-operation between toll operators, Miss Jessie D. Presley, manager, Belding; Information on toll tickets, Mr. Geo. F. Stratemeyer, traffic manager, Grand Rapids.

All of the papers were good and provoked very profitable discussion. The paper on "The Chief Operator" by Miss Heney, the one on the "General Handling of Toll Business" by Miss Close, and "Co-operation Between Toll Operators" by Miss Presley, were accredited special attention as possessing exceptional merit. All present expressed themselves as not only having a very delightful but very profitable two days.

Quite unusual at a convention of this character, the entire delegation sat down to a fine banquet prepared by the ladies of the city, under the management of Secretary H. T. Clough, in the dining-room adjacent to the Foresters' Hall, where the convention was held.

Invitations to hold the next meeting, which will probably be sometime in December, were received from Detroit, Battle Creek, Muskegon, Grand Rapids and one or two other places.

A HOME-MADE LINE LIGHTNING ARRESTER.

By R. B. Fegan.

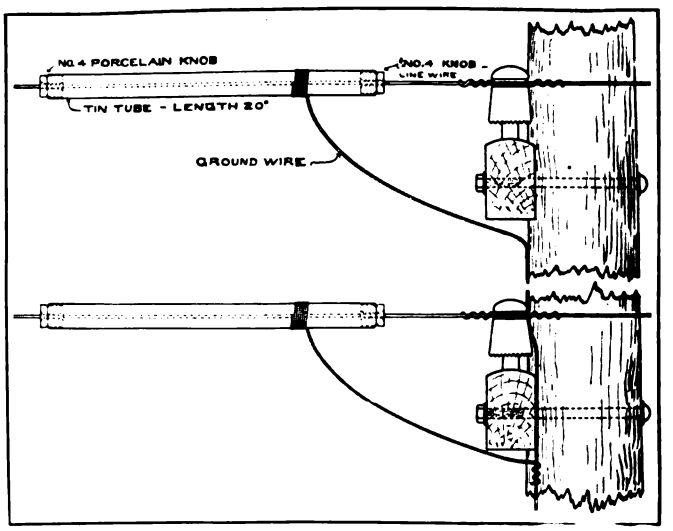
ON long rural telephone lines, where the best protecting devices are not employed in the exchange, the item of repairs in the course of a year occasioned by lightning entering the exchange and burning out the switchboard drops is one that is very likely to cause the manager some little concern. Not only does the lightning cause trouble in this manner, but often a much greater loss of time and material results from a stroke which enters a subscriber's station, or follows a pole from the line wire to the ground, perhaps shattering the pole.

A large portion of this danger may, in the writer's opinion, be obviated by the use of a cheap, yet efficient, line lightning arrester, arranged as shown in the diagram. It is simple in construction, easily applied and can be made by any village tinsmith. All the material necessary is a tin tube twenty inches in length, two No. 4 porcelain knobs and a ground wire.

The tube should be fastened in the same manner as a stove pipe and just large enough to admit the porcelain knobs. Insert a knob in each end of the tube and with a pair of pliers or a hammer gently force the tin down into the grooves of the knobs at each end. This will secure the knobs in position.

The completed arrester is then placed on the line wire, one section from the head, by slipping the line wire through the screw holes of the porcelain knobs, in the manner shown. The ground wire should be wrapped around the tube tightly for about six times and soldered. It is then run down the pole to a well made ground. A number twelve galvanized iron wire serves this purpose the best. All of the arresters on the pole may be connected to the one ground wire.

This comparatively crude arrester, while not making an extraordinarily handsome appearance, serves the purpose of



Lightning Arresters, Each Made of Porcelain Knobs and a Tin Tube, Set Up on Rural Telephone Line.

keeping the line discharge below the striking point and of diverting the major portion of any such discharges away from the exchange arresters and the arresters on the telephones.

The writer has personally used arresters made in the above described manner for the past year and has found them very satisfactory. There is every reason to believe that they have saved their cost, which is about twenty cents a pair, many times over in that time. One particularly commendable feature about them is that they require no renewing or new fuses at any time.

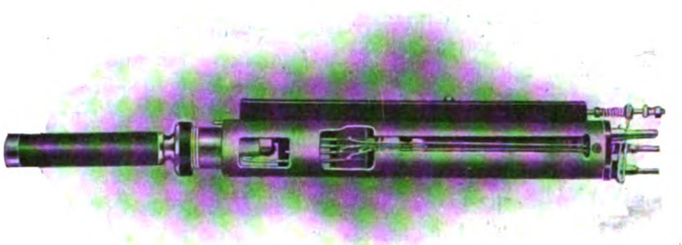
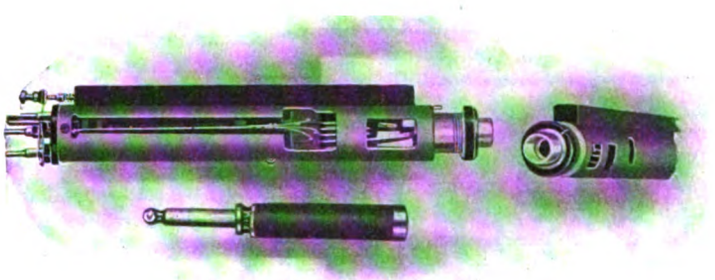
ERICSSON AUTOMATIC DROP FOR MAGNETO SWITCHBOARD





The easier you make it for your operator to handle calls the more efficient your service will be.

The smaller the automatic drop is the smaller the board.

The smaller the range of reach for connections the more subscribers one operator can handle.

Two hundred indicator jacks, as shown by cuts, can comfortably be fitted in a panel measuring 11¼" x 21⅝" and easily handled from one position.

Incased in a soft iron shell, making it practically indestructible, the indicator jack embodies drop, jack and night contact.

It is self-contained and fastens in the panel from the front by a single nut.

The number of drops may be increased one at a time.

The operator cannot replace the signal without inserting the plug fully.

It is patented in all telephone using countries.

The Ericsson workmanship accounts for the successful operation of over 50,000 of these indicator jacks.

Investigate this before you place orders for new switchboards.

From Here and There

NEBRASKA RAILWAY COMMISSION WILL TRY TO STOP DISCRIMINATION AGAINST INDEPENDENT TELEPHONE COMPANIES BY RAILROADS.

STATEMENTS that railroads in Nebraska are discriminating against Independent telephone companies by refusing to allow their instruments to be placed in railroad stations and freight offices, are expected to call forth vigorous action from the State Railroad Commission. Protests from subscribers to Independent telephone systems have been received, and the Railway Commission is now investigating the matter. It is said that in many of the Nebraska towns there are quite a large number of users of telephones who have occasion to speak with the railway officials who are on Independent lines only, and if only the Bell telephones were installed their interests would be seriously damaged. It is said that the comimssion seriously contemplates issuing an order requiring the use of Independent telephones in all railway stations where there is a demand for such instruments.

IDAHO STATE TAX LISTS SHOW MANY NEW TELEPHONE COMPANIES.

STATE AUDITOR BRAGAW announces that a much larger number of telephone and telegraph companies will pay taxes in Idaho this year than ever before. He has 53 companies on his list, a gain of more than 50 per cent over 1906. Under the Idaho law, the county assessors are not charged with the duty of assessing or collecting taxes on the property of railroads, telegraph or telephone companies. This duty falls to the state auditor or the State board of equalization, but with this delegation of authority the law bequeaths no method of ferreting out the companies. He may send notices to the company listed in the office of the secretary of the state, but unless they respond readily, or he goes out in person and hunts them down, he may not know whether they are real or fictitious organizations, or whether they have one mile or 1,000 miles of line in operation. Mr. Bragaw advised the county assessors to look up such corporations in order that his figures for this year might be accurate.

INDEPENDENT COMPANY AT GARRETT, IND., HAS MADE RAPID GROWTH.

A PUBLICATION devoted to the interests of the town of Garrett, a busy Indiana city of about five thousand population, speaks in the highest terms of the Garrett Telephone Company. This was organized in 1903 with the purpose of giving Independent telephone service, six of the local business men being at that time interested.

The exchange was opened with ten subscribers, six of whom were the organizers of the company. Although this start was not very encouraging, the merit of the company's service soon became appreciated, and the list of the subscribers has been steadily increasing. Rural lines have been built, new cable installed in the business district and every effort made to keep the company's plant in first-class condition.

From the very small beginning in 1903 the company has grown until it now has 32,000 feet of cable, 200 miles of aerial wire and 25 miles of rural lines in its plant. The number of stockholders has increased from the original six to the present number of fifty-three, and in the four years since its organization the number of subscribers has grown to fifty-four times the original ten. The success of the company is due in large measure to the confidence of the community in the Board of Directors, as well as to the efficiency of the management, and the interested co-operation of the employees. The board of directors is at present made up of J. B. Mager, L. D. Mager, C. N. McCully, J. Breckbill, S. B. McCullough, J. R. Lantz, Emil Hill, I. D. Moore, H. W. Mountz, W. W. Sharpless and W. H. Coffinberry. The plant is under the management of D. B. Van Fleit.

NEW INDEPENDENT EXCHANGE AT SPOKANE, WASH., NOW BEING CONSTRUCTED.

A CONTRACT for its new $60,000 building was awarded by the Home Telephone Company, of Spokane, Wash., a few days ago. This calls for the construction of the building proper, which must be completed by November 1. Excavation for the building was completed several weeks ago. The company has also put up poles in the city and laid underground conduits to be in readiness to put its plant in operation as soon as the exchange is completed. Cyrus Happy, vice-president of the Home Telephone Company, of Spokane, declares there is no truth in the recently circulated reports that the corporation will be bought out or absorbed by the Pacific States Telephone Company. He added: "The ordinance covering the granting of a franchise to the company by the city council provides that it cannot be sold to any corporation, company or individual. The franchise even prevents us from combining with any other company regarding rental and toll prices."

TELEPHONE COMPANY INDICTED FOR SELLING LIQUOR.

AT Jackson, Mississippi, the federal grand jury has returned indictments against the Cumberland Telephone Company and its manager, charging them with taking orders for whiskey to be shipped from Vicksburg, and receiving pay for the liquor. It is alleged that the company afterward transmitted the money to liquor houses. This placed the company in the position of selling liquor without a license.

TELEPHONE SYSTEMS BEING EXTENDED IN SOUTH AFRICA.

JOHANNESBURG and Durban have recently been connected up by a telephone trunk line, forming an extension to the South African telephone system which promises to considerably increase the interest in this means of communication in that section of the world. The London *Electrical Engineer* recently mentioned projects for further extensions, which will involve considerable outlays for supplies, and result in the building up of a system which will cover a considerable area, thus giving more adequate communication facilities than have heretofore been enjoyed.

Following the local development will naturally result in the establishment of connections between Johannesburg and Cape Town, which are not at present joined by a long distance telephone line. It is said that at last the farmers in South Africa are beginning to realize the benefits which they will derive from telephone service, and are thinking of taking more vigorous action to get in touch with one another. At the recent Cape Farmers' Congress at Oudtshoorn a resolution was passed requesting the government to permit farmers to run wires along existing fences at their own expense, and to connect them with the nearest post office free of charge, which, if granted, will do much toward telephone development on the Cape.

BELL RATE-RAISING OPPOSED IN LOUISIANA.

THE State Railroad Commission of Louisiana, which now has control of the telephone and telegraph lines as well as the railroads, is receiving numerous complaints against the Cumberland Telephone and Telegraph Company for advancing rates. The company has advanced rates in a dozen Louisiana towns within a month and the patrons do not propose to stand for it without a contest. The commission has summoned the officials of the telephone company to appear before it and give reasons why rates should be advanced and the outcome is being watched with much interest.

CYCLOPEDIA OF APPLIED ELECTRICITY

5 Volumes--Each Nearly One Foot High--2,500 Pages

Bound in red morocco, fully indexed. Contains 2,000 full page plates. Diagrams, Descriptions, Formulæ, Sections, Tables—supplemented by practical test questions—prepared especially for practical men who have no knowledge of advanced mathematics by such noted authorities as F. B. Crocker of Columbia University and the Crocker-Wheeler Company, Prof. Esty, Head of the Department of Electricity, Lehigh University, and others.

FOR THE TELEPHONE MAN

Undoubtedly the best set of books published for the manager, lineman, switchboard and troubleman. Every subject in connection with telephone work thoroughly explained in such a plain and easy manner that any one can master it. Treats fully on the Automatic Telephone and Wireless Telephony. Written by **practical** men for practical men. A short cut to a larger salary and better position.

CONTENTS

Telephony, including Common Battery System and Automatic Telephone; Magnetism--Electric Current---Measurements--Wiring--Telegraph, including Wireless and Telautograph--Alternating-Current Machinery--Direct Current Dynamos and Motors, including Types--Motor Drives--Westinghouse Three-Wire System, Storage Batteries; Electric Lighting--Railways--Management of Dynamos and Motors, Power Stations; Power Transmission--Testing of Insulators.

REGULAR PRICE, $30.00. SPECIAL PRICE, $19.80

Sent, express prepaid, for One Week's FREE examination. If the books meet your needs, pay $2.00 cash and $2.00 a month thereafter, until you have paid $19.80, the special price. Return at our expense, if you do not care to keep them.

We make this greatly reduced price for 30 days to interest the public in the superior character of the instruction of the American School of Correspondence, these books being compiled from the representative instruction papers of the school. A 200-page handbook fully describing 60 Electrical and Engineering Courses sent FREE on request if you mention Amer. Tel. Jour. 6-1-'07.

In the Field of Invention

TELEPHONE RECEIVER.

Louis Steinberger, New York, N. Y., patents (No. 847,842; dated March 19, 1907; filed August 4, 1904; serial No. 219,452) a telephone receiver.

This patent covers a form of telephone receiver in which the permanent magnet, the connecting wires and the binding posts are embedded in an insulating composition, the whole mass having an outside casing of metal. The cap is made in the form of a polygon, the flat sides of which make it impossible for the receiver to roll if laid on an incline. The ear piece is convex so that it projects partly into the ear of the user.

TRANSMITTER.

Fred W. Fahrenfeld, Rochester, N. Y., patents (No. 837,457, dated December 4, 1906; filed August 31, 1905; serial No. 276,495) and assigns to the Simplex Telephone Equipment Co., Rochester, N. Y., a telephone transmitter.

This invention comprises a form of telephone transmitter having a convex perforated cap in lieu of the customary mouthpiece; two electrodes retained in a metallic case, one attached to a resilient diaphragm, the other attached to a solid plate, extending across the interior of the retaining shell, which holds it rigidly in position. The electrodes are provided with numerous projections in order to have large contact surfaces. There is provided, in the retaining shell a vent for the escape of air, so that the air within the shell may not by compression form a cushion, and thus retard the vibrations of the diaphragm.

MOUTHPIECE DISINFECTOR.

Robert R. Macgill, Baltimore, Maryland, patents (No. 844,949; dated Feb. 19, 1907; filed April 26, 1906; serial No. 313,838) a sanitary mouthpiece guard.

This invention provides an attachment for a telephone transmitter mouthpiece containing a roll of tissue, impregnated with a disinfectant, which may be pulled taut over the mouthpiece face. The attachment is secured to the mouthpiece by means of two projecting lugs and a thumbscrew.

TELEPHONE METER.

Newman H. Holland, Brookline, Mass., patents (No. 851,090, dated April 23, 1907; filed July 8, 1903; serial No. 160,608) and assigns to Charles Bate, Boston, Mass., a telephone meter.

This patent covers an arrangement at the subscriber's station, comprising an electro magnet, a polarized relay, a quick and a slow moving pawl, together with various cogged wheels and registering devices. It is the intention of the inventor to have this, together with a pole changing switch at the central office, so operate as to register a call in the calling subscriber's apparatus only upon the completion of a satisfactory conversation.

TELEPHONE SWITCH-BOX.

S. C. Houghton, Rome, N. Y., patent 849,615, April 9, 1907.

This patent covers a combination jack and hook switch box

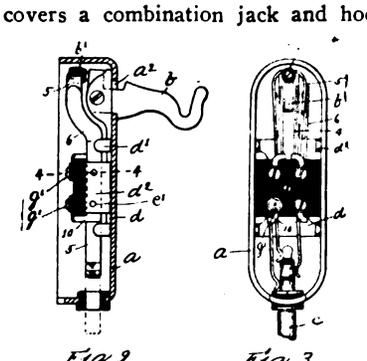

Fig 2. Fig 3.

particularly adapted for use as an extension switch-box in conjunction with a telephone of the hand micro type.

The jack springs, 5, 10, are arranged to make contact with the plug *C* when it is inserted through the jack opening in the bottom of the retaining case. The hand microphone is connected to this plug *C* by a flexible conducting cord, and is cut into circuit with the telephone line upon removal of the telephone from the hook *b* which causes a downward movement of the insulating knob *b'*, thus allowing springs 5 to make contact with springs 4.

TELEPHONE REPEATER.

N. G. Warth, Columbus, Ohio., patent 850,079, April 9, 1907.

This patent describes improvements in telephone repeating apparatus over patent No. 845,282, dated Feb. 26, 1907, granted to Mr. Warth and means whereby the inventor purposes to over-

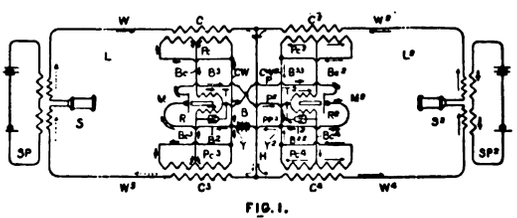

FIG. 1.

come the "howling" or "singing" that occurred in the systems described in the above patent and patents No. 791,655 and No. 791,656, granted to Mr. Herbert E. Shreeve, June 6, 1905, and November 6, 1906, respectively.

As shown in Figure 1, *S* and S^2 are the telephones at opposite ends of a long line with the repeating apparatus inserted in the line at a point of electrical balance.

C, C^2, C^3 and C^4 are repeating coils, *M* and M^2 the variable resistances of the repeating relays *T*, T^2.

AUTOMATIC CALLING DEVICE.

Frank A. Lundquist, Chicago, Ill., patents (No. 846,327, dated March 5, 1907; filed June 13, 1904; serial No. 212,325) a calling device for telephone exchanges.

This patent relates to a calling device for use in connection with an automatic system of subscriber selector-connecting arrangement at a central office.

Impulses of current are conveyed to the central office selecting device over wires in the usual manner and are set up by a rotating commutator in the instrument which is caused to revolve the desired number of times by an arrangement of gears and springs in coactance with an indicating device mounted on the face of the instrument. After the connection with the line desired has been secured the subscriber wanted is signalled by the calling subscriber by means of a hand magneto generator located in the instrument.

A switch is also provided for the purpose of allowing a subscriber on a party line to "listen in" on the line in order to ascertain as to whether the line is "busy" or not, and to allow the replacing of his receiver upon its hook without disturbing the connections of the persons already using the line.

INTER-COMMUNICATING SELECTOR.

Franz Wallock, Berlin, Germany, patents (No. 851,266, dated April 23, 1907; filed November 22, 1904; serial No. 233,866) a line selector for inter-communicating apparatus.

The feature of this invention is that the selector spring is not obliged to travel over the contact points of other lines on its return to the home point.

The switch arrangement is of the circular shape commonly used on inter-communicating instruments and the contact spring is so mounted on a retaining case, together with a hook for the hand microphone, as to be pressed away from the face of the switch contacts a sufficient distance as to escape all of them on its homeward journey, which is accelerated by the medium of a coiled spring contained within the case.

PROFESSOR CARPENTER

of Cornell University, Ithaca, N. Y.

showed conclusively back in 1900 that the Stombaugh Guy Anchor had an enormous holding power.

The seventy odd tests that he made with a dynamometer showed that the different size Stombaugh Guy Anchors would hold as follows:

Five-inch,	12,500 lbs.
Six-inch,	15,000 lbs.
Seven-inch,	17,500 lbs.
Eight-inch,	20,000 lbs.
Ten-inch,	25,000 lbs.
Twelve-inch,	30,000 lbs.

when bored five feet in clay ground.

These figures were obtained from a formula which he worked out as the result of his tests.

Stombaugh Guy Anchors

are used extensively by

The New Telephone Co., Indianapolis.

NEW APPARATUS FOR HOUSE SYSTEMS.

ASIDE from its regular line of long distance apparatus, the L. M. Ericsson Tel. Mfg. Co., Military Road, Buffalo, N. Y., is placing on the market a decidedly attractive private or house telephone, and a new battery bell to go with it.

Fig. 1 shows the house telephone. The back is made of drawn steel, finely japanned and of "Nouveau Art" design. On this is mounted the monitor bell, the terminals, push button and a suspension hook for the hand micro. The latter is attached to the instrument by a two-way plug and jack.

Only two wires are used between two stations, the third terminal being connected to the battery.

The apparatus is sold in pairs and is intended especially for private homes, and for easy communication between offices. It may also conveniently be used in hotels, large private residences, and apartment houses, in connection with an annunciator board.

The battery bell, Fig. 2, is extremely efficient and will ring loudly with only one dry cell. It has a drawn steel base, japanned black. A heavy nickeled gong covers the mechanism and makes it bug proof. From the start both of these novelties are said by the company to have taken the fancy of the customers and seem to be just what they have been looking for.

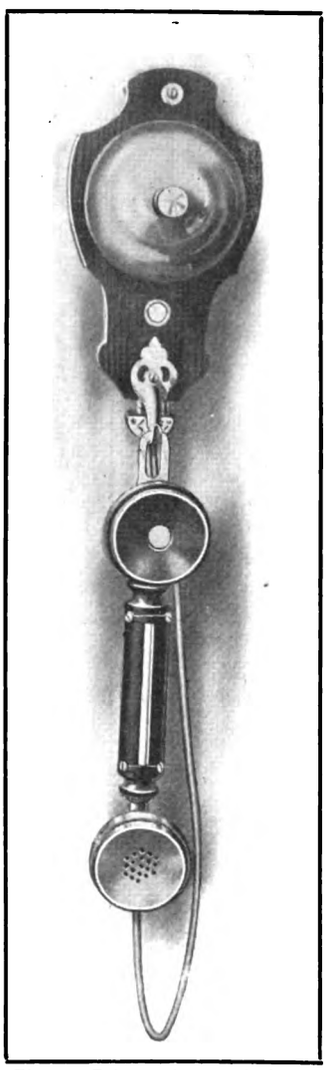

Fig. 1. Ericsson house telephone.

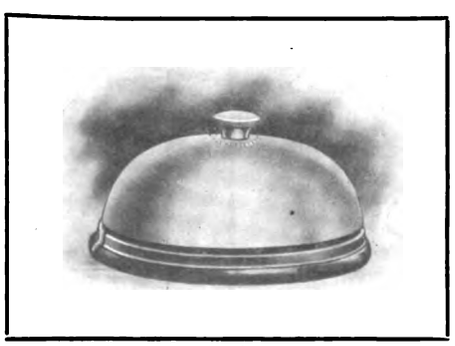

Fig. 2. Ericsson bell for intercommunicating sets.

W. N. MATTHEWS & BRO., 219 No. 2nd St., St. Louis, Mo., has secured for its exhibit at the Chicago Convention, Room 644 at the Auditorium Hotel. One of the exceptionally interesting features which will be shown will be a Stombaugh guy anchor embedded in clay, showing its appearance when set as in actual practice. Other features will be the Callahan cable roller, Hargis cable splicing joint and the Hold-fast lamp guard.

Those who are interested in the Hargis cable splicing joint will have an opportunity to see men put the joint together, and thus learn how the whole operation is performed from start to finish, seeing for themselves the saving in time which is effected by its use. To convince the doubtful that this joint is moisture proof, the company expects to show the fish tank tests which have been described in a previous issue of this journal. Souvenirs, which will be money savers, emphasizing the company's practice in dealing in money saving specialties, will be given out to visitors. The representatives chosen for this Convention are Messrs. Claude L. Matthews, O. R. Johann and Luther Hargis, the last being the inventor of the Hargis cable splicing joint.

THE UNITED STATES COIN REGISTER CO., Toledo, Ohio, will exhibit its well known Combined Cash Register and Pay Station, in Room 628, Auditorium Hotel, Chicago, during the International Convention.

THE CENTRAL TELEPHONE & ELECTRIC COMPANY, St. Louis, Mo., will have a nicely arranged exhibit in Room 616, at the Auditorium Hotel, directly across the hall from the elevator on the Convention Hall floor, at Chicago. A full line of telephone apparatus will be shown, and a number of the many specialties of its own manufacture, which are becoming so well known to the trade. The exhibit will be attended by Mr. J. S. Cuming, president; C. H. Wallis, vice-president; L. G. LeBourveau, sales manager, and several of his assistants.

THE GOULD STORAGE BATTERY COMPANY, formerly No. 1 West 34th St., New York City, has recently removed its offices to Nos. 341-347 Fifth Ave., at the corner of 34th St. This is a more convenient location, and will give the company better conveniences for meeting its customers and transacting its rapidly growing business.

STROMBERG-CARLSON TELEPHONE MFG. COMPANY, Rochester, N. Y., will have an attractive display at the Convention. Two large rooms have been reserved, one of which will be fitted up as a reception room, and the other for the display of apparatus. The company intends to pay particular attention to the comfort of its customers, and will make careful provision to secure this end. In the exhibition room there will be displayed a small assortment of standard apparatus. In addition to this exhibit an automobile service will carry telephone men at half hour intervals from the Auditorium to the company's offices on Jackson Boulevard, where a much larger exhibit has been arranged, illustrating various forms of apparatus in service.

H. C. Slemin, advertising manager, has procured a few attractive souvenir postal cards for distribution. J. P. Cracraft, sales manager, Mr. Slemin and other representatives will have charge of the exhibit.

THE MANDREL CONDUIT CLEANER.

Cable men who have met with difficulty in cleaning ducts properly before drawing in cable will be interested in the Mandrel conduit cleaner made by Colman J. Mullin Company, 430 Kent Ave., Brooklyn, N. Y. This is designed and manufactured under the direction of Mr. Mullin, who is an experienced and practical telephone man. All that is necessary to clean a duct is to pull through the cleaner, which carries at intervals a series of leather discs mounted upon a flexible shaft. The flexible shaft makes it possible to draw the cleaner around bends, and the plurality of leather discs, separated by considerable intervals, leaves room for all of the dirt which may be in the duct in the spaces between them, and there are

enough discs to insure perfect cleaning. Provision may be made to renew the leather washers, thus securing economy. Full information concerning this device may be obtained by writing to the manufacturers.

FEATURES OF THE EASOPHONE.

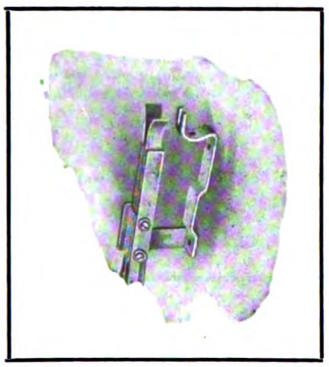

Fig. 1. Arrangement of switch springs in Easophone.

SINCE the placing upon the market of the Easophone, a new hand telephone, manufactured by The Wire & Telephone Company of America, Rome, N. Y., a great deal of interest has been shown in some of its decidedly novel features. Among these the construction and operation of the hook switch deserve especial attention. This is so arranged that the hook may be placed upon either side of the box by a very simple operation, which does not require the use of tools. The switch, made in the form of a key, has no rubbing contacts, which are now generally believed to be objectionable. It is controlled by a fibre cylinder carried upon a rotating shaft which extends across the box, as shown in Fig. 2.

When the telephone is upon the hook a stud upon the rear of the hook engages a pin upon the rotating shaft, and the weight of the hook, balancing the tension of the spiral spring attached to the shaft support and to the shaft itself, maintains the cylinder out of engagement with the switch. As soon as the hook is removed the tension of the spring causes the rotation of the shaft to bring the cylinder into the space between the movable springs, thus effecting the changes in the contacts to bring the receiver and transmitter into circuit.

In Fig. 2 it will be seen that the right hand support for the shaft has an opening to receive a pin which holds the hook. All that is necessary to replace the hook upon the opposite side of the shaft is to withdraw the pin from its position shown in illustration, insert the hook in the right hand support and replace the pin.

The single coil ringer used is so constructed as to occupy the minimum amount of space. There is no necessity for adjusting interior parts to secure the best ringing; only the gongs need be moved, and they may be set by a screw driver from the outside of the box.

Line connections are brought into binding posts of a new type. These Houghton binding posts are illustrated in Fig. 4. The opening for the wire is conical, and the point of the pin stud is also conical, making a contact which is firm, and at the same time designed so that there is no cutting or creeping of the wire. Connection to the interior of the instrument is made through the solid rubber block in which the posts are mounted by means of tubes, which permit of a firm soldered joint with interior wiring, and by the method of their attachment prevent any twisting of the binding posts.

At the Chicago Convention these instruments, and also rubber covered wire and magnet wire will be exhibited in Room 647, at the Auditorium Hotel.

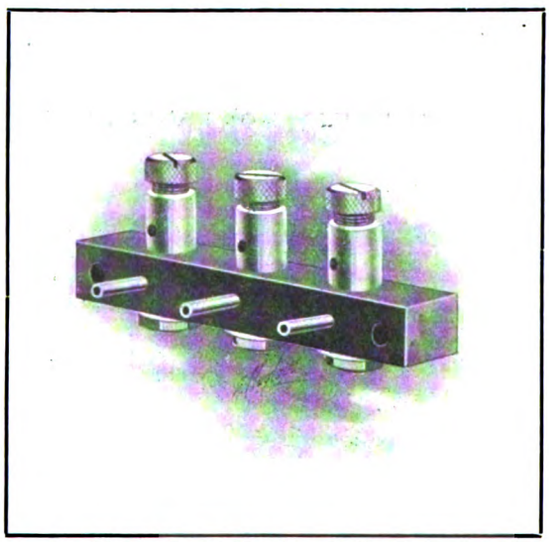

Fig. 4. Set of Houghton binding posts.

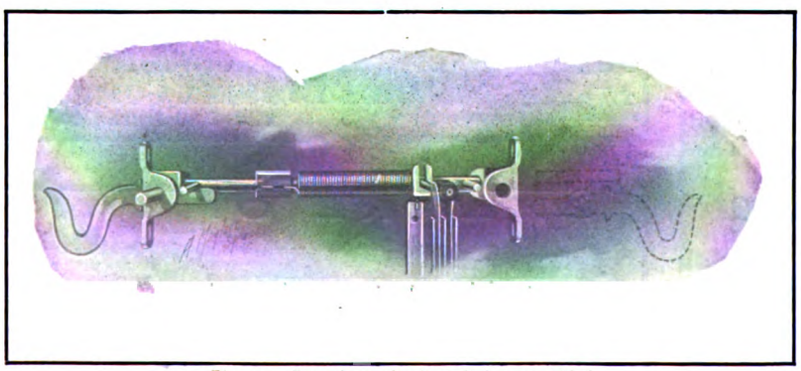

Fig. 2. Easophone hook switch, assembled.

RATE-MAKING FOR INDEPENDENT TELEPHONE COMPANIES.

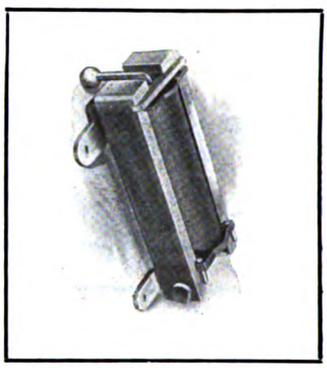

Fig. 3. Single coil ringer.

WHAT is agreed by many Independent telephone men to be a much needed organization has been perfected and has incorporated under the laws of Ohio in the name of The Davis Telephone Rate Adjusting Company, with offices in Cleveland.

Mr. H. L. Davis, from whom the company takes its name, and who has been made vice-president and general manager of the new company, is a man of long experience in the telephone field, having first worked for the Bell company as solicitor and special agent, entering into the Independent field some seven years ago.

All his men are chosen for their experience as solicitors and their ability to present an intelligent telephone talk. They are permanently employed and are drilled along lines intended to bring the best possible results.

A feature of the new company is to guarantee the class of business secured, thus saving any company the expense of paying for names of persons who have not subscribed at all, which often occurs with inexperienced or dishonest solicitors.

Prior to the organization of the new company Mr. Davis was unable to take more than two or three canvasses at one time, but he now states that he has perfected an organization which enables him to handle any number and give his personal attention to every one. The company is having printed a booklet which tells more fully about the object of its organization, and plans for conducting its work and which will be sent to any address upon application to the Cleveland office, 708 Electric Building, Cleveland, Ohio.

The officers of the new company are H. E. Scott, president; W. G. McCullough, sec. and treas., and H. L. Davis, vice-president and gen'l manager.

THE CENTURY TELEPHONE CONSTRUCTION Co. is now located in its new factories, 1738 Elmwood avenue, Buffalo, N. Y., where it has in operation one of the largest, most complete and up-to-date plants for the manufacture of telephone apparatus in the country.

THE MAN WHO PLANS

THERE is no haphazard guess-work about the building of railroads, or the bridging of yawning chasms; every detail of construction, every little problem has been solved. Every move has been carefully planned and written down on paper before a stroke of work is done. There is a reason for every spike, every switch, every twist and turn of the track. The safety of human life depends upon the accuracy with which every inch of rail is laid.

Your success in life depends upon the careful thought with which you have planned your career. Will you be holding a better position five years hence, earning more money, **because** you are planning step by step to reach such a position, or are you merely hoping and wishing that something will "turn up" to help you? Are you holding your **present** position by accident, or by choice? You cannot succeed unless you give at least as much careful thought to **planning** your journey through life as you would a fifty mile pleasure jaunt.

If you are a young man, without a profession or trade, an older man dissatisfied with poorly paid, uncongenial work, you can **better yourself** by studying in your spare hours. Send for our FREE handbook to-day describing over sixty Engineering and Technical Courses. Mark the subject on the coupon and let us help to **plan** a paying career.

We Employ No Agents to bother you with repeated calls at your home or place of business. We talk to you only by mail. The money you pay us is not used to maintain an expensive organization of high-priced agents, but is used to give you better instruction at a lower cost.

COUPON—Cut out and mail to-day

Please send me 200-page hand-book. I am interested in the course marked "X." Am. Tel. Jour., 6-1-07.

Good News—and It's All New

NEW COMPANIES.

NEW PRAGUE, MINN.—The Union Hill Telephone Company, Union Hill, P. O. address New Prague, Minn., has been incorporated with a capital stock of $8,000. The incorporators are C. A. Backman, Waterville; Joseph Widmer, E. M. Widmer, New Prague.

CRETE, NEB.—Articles of incorporation have been filed by the Crete Telephone Company, whose intention it is to build and operate a telephone system in this city. It has a capital stock of $100,000, and among those interested in the enterprise are F. H. Woods, C. W. Nunemaker, B. G. Miller and others.

COLEBROOK, N. H.—The Southern Coos Telephone Company, with a capital stock of $10,000, has filed articles of incorporation.

PALISADES PARK, N. J.—The Radio Telephone Company, with an authorized capital stock of $2,000,000, has been incorporated by Lee De Forest, Samuel E. Darby, Henry Froukel, Walter J. Scott and Fred W. Southemer.

HOWARD, N. Y.—An Independent telephone company, to be known as the Howard & Hornell Telephone Company, has been incorporated with a capital stock of $740, and the following directors elected: W. B. Alden, I. S. Goff, L. I. Sharp, Howard.

PRATTSVILLE, N. Y.—The Johnson Hollow Telephone Company, Prattsville, has filed articles of incorporation. The capital stock is placed at $500, and the directors are Jacob Latz, M. T. Speenburgh, S. P. Ives, Roxbury, Delaware county.

EDINBURG, N. D.—A new Independent telephone company has been organized at this city under the name of the Edinburg & Tiber Telephone Company, and the following officers elected: President, Henning Gunhus; secretary-treasurer, O. Fauskee; directors, Dan Halvorson, A. N. Brunsvold, Jorgen Nygaard. Construction on the company's system will be commenced at a very early date.

ALINE, OKLA.—Articles of incorporation have been filed by the Valley Green Telephone Company of Aline. It has an authorized capital stock of $1,000, and the incorporators are F. M. Piburn, J. H. Elkins and J. D. Durham.

BINGER, OKLA.—The White Bread Telephone Company, with a capital stock of $600, has been incorporated. Among the incorporators are C. T. McSpaerin, of Cox; O. E. Bare, H. L. Proteet, Gracemont; M. V. Stewart, C. S. Daugherty and D. C. Costello, of Binger.

QUINLAN, OKLA.—The Quinlan & Cedardale Free Exchange Telephone Company has filed articles of incorporation. It has a capital stock of $5,000, and the incorporators are Ben Huff, Henry Lamsey, John Johnson and Samuel Catlett.

REEDING, OKLA.—The Reeding Telephone Company, of Reeding, has been incorporated with a capital stock of $1,000, and among the incorporators are G. T. Dixon, of Okarche, G. B. Caron and B. F. Cole, of Reeding.

TEXHOMA, OKLA.—The Texhoma Telephone Company has been incorporated with a capital stock of $5,000, and the following directors elected: T. E. Osborne, J. F. Osborne and G. Osborne.

VERMILION, S. D.—On account of the poor service rendered by the Northwestern Telephone Company, the citizens of Vermilion are organizing an Independent telephone company, whose intention it is to construct a telephone system, which will eventually be turned over to the municipality. The chief worker in the new movement is ex-Governor Lee.

DALE, TEXAS.—An Independent telephone company has been organized at Dale, whose intention it is to erect a local exchange. Among those interested in the enterprise are J. A. Ward and others.

SPRINGTOWN, TEXAS.—The Springtown Telephone Company has been incorporated with a capital stock of $5,000. Among the incorporators are J. T. Roberain, W. A. White and C. Malone.

COLFAX, WASH.—Articles of incorporation have been filed by the Lone Pine Telephone Company, of Golden School House, near Colfax. It has a capital stock of $1,200, and the incorporators are William Richardson, E. L. Ross and H. E. Davis.

SCHLEISINGERVILLE, WIS.—The Washington County Telephone Company, with a capital stock of $1,500, has been incorporated by John F. Kramer, Charles D. Storck and M. Maxam.

FRANCHISES.

COFFEYVILLE, KAS.—The Kansas City Long Distance Telephone Company has applied for a franchise at this city.

THIEF RIVER FALLS, MINN.—A syndicate of business men, composed of T. P. Hamre, D. B. Bakke, C. M. Evenson, C. C. Jackson, Henry Grundy and George Stearns, has applied to the city council for a franchise to erect and operate a telephone exchange. The city is to have the privilege of buying the plant at the end of seven years by paying the cost of construction. The proposed plant is guaranteed to be in good working order by May 1, 1908.

WARREN, N. H.—The Baker's River Telephone Company, of Warren, has been granted a franchise at Littleton, where it will install a common battery system. It has also received a permit in Franconia, N. H., and will construct lines through that town and through Franconia Notch.

GALLATIN, TENN.—A franchise has been granted in Gallatin to the Home Telephone Company, and work is to commence at once on lines from Westmoreland, where the company has an exchange in operation, to Gallatin.

CASTLE DALE, UTAH.—The Green River Telephone Company has been granted a franchise to construct and operate a telephone system on the highways of Emery county.

FINANCIAL.

YELLVILLE, ARK.—The Yellville Telephone Company has declared a dividend of 10 per cent.

TAMPICO, ILL.—The Tampico Farmers' Mutual Telephone Company is considering the advisability of increasing its capital stock from $6,000 to $10,000.

CORINNA, ME.—The capital stock of the West Penobscot Telephone & Telegraph Company has been increased from $10,000 to $50,000.

JACKSON, MINN.—A dividend of 6 per cent. on its stock, payable July 1st, has been declared by the Jackson Telephone Company.

MINNEAPOLIS, MINN.—The directors of the Tri-State Telephone Company have declared the sixteenth quarterly dividend at the rate of six per cent. per annum, payable June 1st, 1907, to stockholders of record of May 20th, 1907. The company under its guarantee will also pay the twenty-first quarterly dividend of the Twin City Telephone Company at the stipulated rate.

DILLER, NEB.—At the annual meeting of the Diller Telephone Company a 15 per cent. dividend was declared, and the sum of $2,226 distributed among the stockholders.

WARREN, N. H.—The Baker's River Telephone Company has called a meeting of the stockholders to increase the capital stock to $20,000.

CHENANGO FORKS, N. Y.—The stockholders of the Chenango Valley Telephone Company, at a meeting recently held at Chenango Forks, voted to increase the capital stock from $7,000 to $10,000.

CHESTERHILL, O.—The capital stock of the People's Telephone Company has been increased from $20,000 to $50,000.

MECHANICSBURG, O.—The stock of the Mechanicsburg Telephone Company has been increased from $35,000 to $50,000.

NEW CASTLE, PA.—A $25,000,000 mortgage has been filed upon all of the properties of the American Union Telephone Company by the Fidelity Title & Trust Bank of Pittsburg. This money will be used by the Independent company in making improvements.

BELOIT, WIS.—The Beloit Telephone Company has declared a dividend of 6 per cent.

ELECTIONS.

MASON CITY, ILL.—The following officers have been elected by the Mason City Independent Telephone Company: C. A. Stone, president; H. F. Reason, vice-president; J. F. Culp, secretary; W. A. Grandy, treasurer.

NEWTON, IA.—The Murphy Mutual Telephone Company has elected Geo. W. Shelly, president; J. N. Livingston, treasurer; J. W. Murphy, secretary; J. H. Zink, C. C. Garver, E. L. Snyder, Bert Squires, J. F. Wheatcraft, directors.

IOWA, LA.—The following are the officers of the Iowa Telephone Company, Ltd.: J. F. Denison, president; Geo. Goodrich, vice-president; B. F. Waitt, secretary; A. N. Gibbs, treasurer; and these together with A. J. Findlay, H. L. Longenbach, A. T. Jones, S. Petticrew and F. G. Petticrew comprise the board of directors.

DETROIT, MICH.—The Home Telephone Company has elected the following directors: Henry Koehler, Hugo A. Koehler, Max Koehler, A. W. Lambert, C. Marquard Foster, Henry C. Stifel, S. B. Jeffrey, J. J. Goodyear and A. N. Edwards, of St. Louis; H. C. Potter, Jr., G. E. Lawson, W. T. Barbour, F. T. Moran, J. M. Dwyer and W. B. Woodbury, of Detroit.

UNIONVILLE, MO.—At a meeting of the Board of Directors of the Putnam County Telephone Company the following officers were elected: J. N. Comstock, president; H. L. Holman, vice-president; G. E. McCutchen, secretary; L. P. Roberts, treasurer; J. H. Holman, business manager.

MISCELLANEOUS.

GRISWOLD, IA.—The Farmers' Mutual Telephone Company, which has

WANTED—SPECIAL CORRESPONDENTS

OWING to the rapid growth of the Independent telephone movement in all sections of the country, we have openings for special correspondents in every State to work in conjunction with our already efficient corps. Matter similar to that in our Message and Operating Field pages is especially desired. For details address the Editor.

The Independent Telegraph

The Natural Ally of the Independent Telephone

To all Interested in the Independent Telephone Movement:

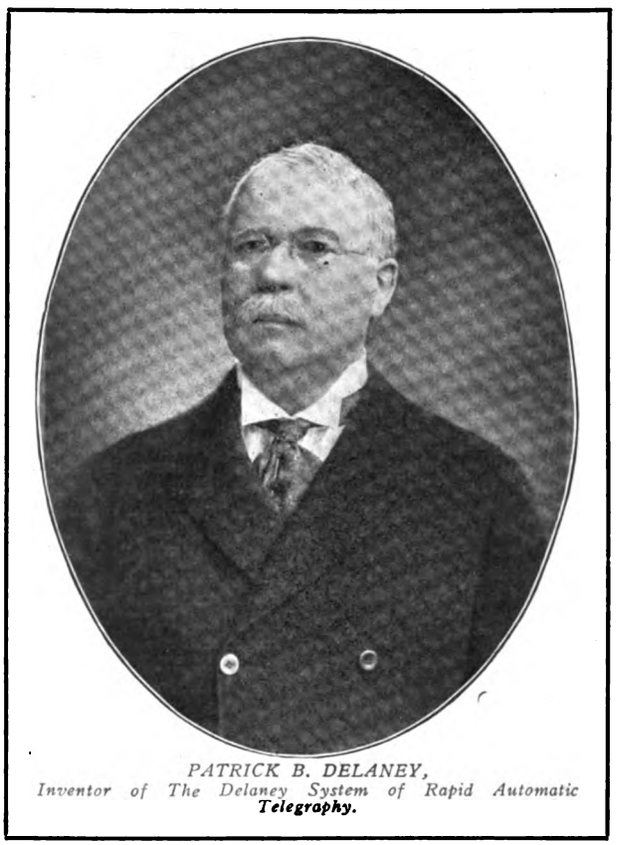
The Telepost Company, recently incorporated with a capital of $18,000,000, is rapidly organizing to give the American public what it sorely needs—cheap, quick telegraphy. By means of the only device that can utilize fully the carrying capacity of a wire—the Delany System of Rapid Automatic Telegraphy—the new and revolutionary telegraph will take its place with the telephone in the very forefront of public conveniences and necessities.

Long continued use and actual commercial work under all kinds of conditions have demonstrated conclusively that the Delany system is highly practical, thoroughly practicable and soundly commercial. Its economic energy is proved by the fact that it gets as great service from one wire as the Morse companies get from seventeen with the aid of the quadruplex, or from twenty-seven with the duplex, or from sixty-six when they have to depend upon the Morse simplex, as they do for 99 per cent of their service. The Delany system works undisturbed in all weathers, even when the other methods are completely out of commission.

The Telepost Company will carry the 50-word telepost or the 25-word telegram between any two of its offices for 25 cents. One price everywhere and anywhere in the United States.

The Delany system works over telephone circuits without the slightest interference with the latter form of service.

For the telephone companies not to get a profit from the telegraphic use of their wires would be shortsighted. To get any but the largest possible would be poor business. The Telepost Company can and will yield a larger return to the telephone companies than either of the telegraph companies could afford to give, or than the telephone companies themselves could earn by doing a telegraph business with any of the methods open to them.



PATRICK B. DELANEY,
Inventor of The Delaney System of Rapid Automatic Telegraphy.

Naturally, the Independents and the Telepost should have a close working union. The lines of the Independents should increase the wire mileage of the Telepost, and the big trunk lines of the Telepost should increase the long distance facilities of the Independents.

In order to make it impossible for any adverse interest to have anything whatever to do with the management of the Telepost, the voting power of the entire issue of stock has been placed in a voting trust, consisting of the following well-known men:

Hon. John W. Goff, New York, Judge of the Supreme Court; S. S. McClure, New York, editor and founder of *McClure's Magazine;* H. D. Critchfield, Milwaukee, Wis., president Milwaukee Independent Telephone Company; F. W. Shumaker, New York, treasurer Sterling Debenture Corporation; H. Lee Sellers, New York, secretary R. H. Sellers Company.

It will require the concurrent vote of all five to sell any of the rights, patents or other properties of the company. The Lincoln Trust Company, of New York City, acting as the agent of the above voting trust, will issue to the purchasers of stock its negotiable receipts, equivalent to the actual stock in every particular, excepting the right to vote.

The Board of Directors, as thus far made up, consists of:

Captain W. J. Barnette, U. S. N., Washington, D. C., General Board Navy Department; A. K. Brown, Chicago, Ill., president Kenwood Trust & Savings Bank, Chicago, Ill.; John M. Carrere, New York, Carrere & Hastings, Architects; Thomas Conyngton, New York, Conyngton & Harrison, Attorneys; H. D. Critchfield, Milwaukee, Wis., president Milwaukee Independent Telephone Company; R. H. Sellers, H. Lee Sellers, New York; C. H. Silliman, New York, founder Land Mortgage Bank of Texas, Ltd.; Hon. Wilson H. Fairbank, Warren, Mass., ex-Senator Massachusetts.

The Sterling Debenture Corporation, Brunswick Building, Madison Square, New York, whose officers are wide-awake men with reputations of long standing for the highest integrity and ability, are to co-operate with us and will have the exclusive handling of the shares offered for sale. They will furnish sufficient funds to build an installation that will put the Telepost Company on a paying basis from the start and lead to its rapid extension.

We feel that it is due to the Telepost, to you and to ourselves, that we lay our plans first before you. In our arrangements with the Sterling Debenture Corporation we stipulated that no stock should be offered to their customers until we had reached as many as possible of the officers and shareholders of the Independents and given them an opportunity to secure as much of the Telepost as they cared to own.

This is not, however, in any sense a solicitation to you to buy stock of the Telepost Company. Every share the Sterling Debenture Corporation offers for sale will find a ready purchaser among their many customers; but we tell you frankly that we hope every available share offered will be taken by the Independents, and that you and we shall own the Telepost.

Our object in this announcement is simply to lay everything before you, as is due you, considering our many mutual interests and possibilities, so that no one can ever say that we had passed over members of the same family and made the first offer to strangers.

Mr. Delany's and our long desired plan of giving to and preserving for the American public a telegraph service worthy the name and the nation is now to be consummated, and we are seeking to make our first announcements to you, our allies, in the Independent field.

We shall be pleased to send you a prospectus upon application.

Yours very truly,

R. H. SELLERS COMPANY,
225 Fifth avenue, New York City.

Digitized by Google

been granted a franchise at this city, expects to take over the lines of the Musson Company, the consideration being $7,500.

CLAY CENTER, KAN.—The local telephone system, formerly owned by C. W. and P. F. Trice, has been taken over by the Clay Center Telephone Company. The new company is composed of H. O. Axtell, William Docking, W. H. Fletcher, P. M. Conrad, G. M. Stratton, Lewis Kreeck, C. W. Trice and P. F. Trice. It is to be capitalized at $40,000; $20,000 preferred and $20,000 common stock. Plans are being made to greatly improve and extend the system and it is estimated that about $15,000 will be expended in this work.

OWINGSVILLE, KY.—The plant of the Owingsville & Wyoming Telephone Company has been taken over by the Bath Home Telephone Company, whose intention it is to improve the system.

DOWAGIAC, MICH.—The Cass County Home Telephone Company is now building seven exchanges in Cass county. Each exchange will have its distributing system of the all-cable type. Connections with the Independent long distance systems on the north and south will be made with 200 miles of new copper toll line.

This company has recently been organized by M. W. Briggs, of Delta, O., who will act as general manager. Besides having a large amount of capital from Toledo, O., the company has several strong local men as stockholders.

FAIRMONT, MINN.—The Fairmont Telephone Company has sold its exchange at Heron Lake to the Fulda Telephone Company, of Fulda, the consideration being $4,000.

BLUE SPRINGS, NEB.—The Blue Springs Telephone Company is considering the advisability of forming connections with the New Home Telephone Company at Wymore.

BEDFORD, PA.—The entire stock of the Bedford County Telephone Company has been taken over by F. D. Houck, general manager of the American Union Telephone Company. Extensive improvements are to be made in the plant, including the installation of common battery exchanges and the establishment of long distance connections to other important exchanges in Pennsylvania.

ORMSBY, WIS.—The Union Line Telephone Company, of Ormsby, expects to form connections with the Antigo Telephone Company at Deerbrook.

PERSONAL.

CARL ARMSTRONG has been appointed manager of the exchange of the Central Union Telephone Company at Galena, Ill.

ISAAC B. CARPENTER, who has been superintendent of the traffic department of the Providence Telephone Company, Providence, R. I., has recently assumed additional duties, having been placed in direct charge of several of the most important exchanges of the company.

P. H. HOPKINS has recently been appointed contract agent of the Rocky Mountain Bell Telephone Company at its headquarters at Salt Lake City, Utah.

P. H. IRWIN has been appointed superintendent of the Salt Lake City division of the Rocky Mountain Bell Telephone Co.

EDGAR P. MILLER has been appointed manager of the Saline County Telephone Company at Marshall, Mo.

W. W. RIDER, of Allentown, Pa., has been appointed superintendent of Division No. 3 of the Consolidated Telephone Companies, and will have charge of the company's interests in Reading, Mauch Chunk, Lehighton, Allentown, Bethlehem and Easton.

With the Builders

MASON CITY, ILL.—The Mason City Independent Telephone & Telegraph Company expects shortly to begin the construction of its system in this city.

HUNTINGTON, IND.—Extensive improvements and additions are planned by the United Telephone Company in its system at Huntington, and it is its intention to make the exchange at this city one of the best and most extensive in the state.

WAUKON, IA.—New lines are being built by the Standard Telephone Company in Waukon.

AVON, ILL.—The Avon Mutual Telephone Company is planning for the rebuilding of its system, and expects to make its plant up to date in every particular.

BARRINGTON, ILL.—Lines north of Barrington are being constructed by the Lake County Telephone Company to take care of its increasing business.

NATALBANY, LA.—The New Orleans, Natalbany & Natchez Railroad, which has just completed a telephone line from Natalbany to Montpelier, expects to erect a line to Pine Grove.

DOWAGIAC, MICH.—The Home Telephone Company, which is at work on its plant in this city, contemplates the construction of lines to Cassopolis, Marcellus, Volinia, Wakeless and Vandalia.

DIXFIELD, MAINE.—The Northeastern Telephone Company is considering the advisability of extending its lines from Dixfield to Carthage.

KINDERHOOK, MICH.—A telephone system is being constructed at Kinderhook by the Himebaugh Telephone Company.

LANSING, MICH.—A new telephone exchange building is to be erected by the Citizens' Telephone Company.

HALLOCK, MINN.—Additions to its system are being made by the Kittson Telephone Company.

CASSVILLE, MO.—The Hailey Telephone Company, of Hailey, has built a line to Cassville.

MONIDA, MONT.—The Centennial Telephone Company, which was recently organized, expects shortly to commence work on its lines from Monida to Lakeview. A number of branch lines to the north side of the Redrock River are also to be constructed.

WYMORE, NEB.—Many improvements in its plant at this city are contemplated by the New Home Telephone Company.

CANTERBURY, N. H.—Many improvements and extensions in its system are being made by the Canterbury & Boscawen Telephone Company.

JEFFERSON, N. H.—The Jefferson Telephone Company is extending its line on the Cherry Mountain, and is otherwise improving its plant.

PLYMOUTH, N. H.—The Baker's River Telephone Company, Warren, is constructng local and trunk lines from Plymouth to North Woodstock and Lincoln. An exchange is to be installed at North Woodstock and lines built from Warren to Woodsville.

SILVER CITY, N. M.—To take care of its increasing business, the Grant County Telephone Company has installed a new switchboard. Other improvements in the company's plant include the rebuilding of its line from Silver City to Santa Rita, Hanover and Fierro, and the construction of new lines to Leopold, Tyrone, Comanche, Copper Gulf and other points. Upon the completion of these extensions the company's plant will be a very complete one.

RAVENNA, N. Y.—The lines of the Ravenna & Medway Telephone Company are being extended to take care of new business.

BLACKSTONE, N. C.—The Yadkin Valley Telephone Company, of Blackstone, is preparing to erect lines to Patterson and Lenoir.

SMITHFIELD, N. C.—The construction of the plant of the Johnson County Independent Telephone Company has been commenced.

TAYLORSVILLE, N. C.—The People's Telephone Company is building a line from Taylorsville to Statesville, to connect with the Iredell Telephone Company, the anti-monopoly company that put the Bell out of business in Statesville. When the line is completed connection will be secured between the towns of Wilkesboro, Statesville, Lenoir, Taylorsville and other smaller towns along these routes.

MANDAN, N. D.—About six thousand dollars are being expended in improvements by the Mandan Telephone Company, and it is expected that its plant will be one of the best in the state when it is completed.

ASHLAND, O.—It is the intention of the Star Telephone Company to expend $50,000 in the improvement of its system.

CORVALLIS, ORE.—The Home Telephone Company is constructing a trunk line from Corvallis to Peoria.

WASHINGTON, PA.—A line from Washington to Waynesburg is being erected by the State Mutual Telephone Company.

CHATTANOOGA, TENN.—A telephone system between Chattanooga and Oakdale has been completed on the Queen & Crescent R. R., and it is its intention to extend the system as far north as Cincinnati.

PETERSBURG, VA.—The Petersburg Telephone Company, which has recently erected a very complete exchange at this city, is replacing all of its old telephones with new instruments.

TERRA ALTA, W. VA.—The Terra Alta Telephone Company is making many improvements in its system.

AMHERST, WIS.—It is the intention of the Amherst Telephone Company to extend its lines from Custer to Stockton, and later to Ellis and Polonia.

MADISON, WIS.—The Standard Telephone Company is building a line from Madison to Stoughton and McFarland.

WHITE OAK, WIS.—The White Oak Telephone Company is extending its system in Shullsburg.

CALGARY, ALB., CAN.—By a vote of 224 to 52 the citizens decided in favor of raising $125,000 by the sale of debentures for the installation of a municipal telephone system. Address City Engineer Thorold or Mayor Cameron.

STETTLER, ALB., CAN.—At a meeting of the town council it was unanimously decided to ask the provincial government to install a telephone system at this city. Address Will Godson.

BRANDON, MAN., CAN.—Hon. J. H. Howden, minister of telephones for Manitoba, states that construction will be commenced in June on the installation of a government telephone system in Brandon.

DELORAINE, MAN., CAN.—The council of the municipality of Brenda is considering the installation of a telephone system. Address Alex. Innis, Deloraine, Man.

ELGIN, MAN., CAN.—At a meeting of the council of the municipality of Whitewater it was decided to ask the government for the necessary information for the construction of a rural telephone system. Address J. Donley, Minto, Man.

WINNIPEG, MAN., CAN.—On account of the announcement by the Bell company that an advance in rates would be made, the Hon. J. H. Howden, minister of telephones, has stated that plans are being prepared for an exchange to be built at this city by the government, and construction of a government system will commence in June.

WOLSELEY, SASK., CAN.—The city council is considering the advisability of installing a municipal telephone system. Address R. A. Magee.

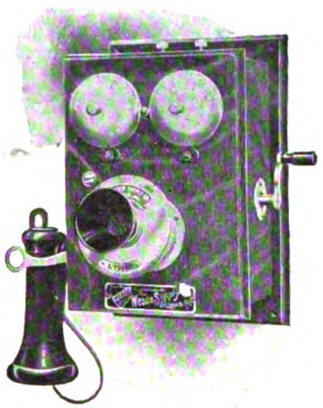
The Smallest Magneto Telephone



DIMENSIONS.

Width	5	inches
Depth	4	inches
Height	7¼	inches

The Wesco Long Distance Residence Telephone Model No. 51 is the smallest and most compact Magneto Telephone made.

It is especially designed for use in residences where wall space is limited and where ornamental design and beauty of finish are as essential as the efficiency of the working parts.

It is equipped with our Standard Receiver, Hook-Switch, Long Distance Solid back Transmitter, 80 ohm ringer and 3-bar Generator, each part being the best that money can buy. It is also made with 4-bar Bridging Generator with 1,000, 1,600 and 2,000 ohm ringer movement.

Write for General Telephone Supply Catalog and our monthly net price list.

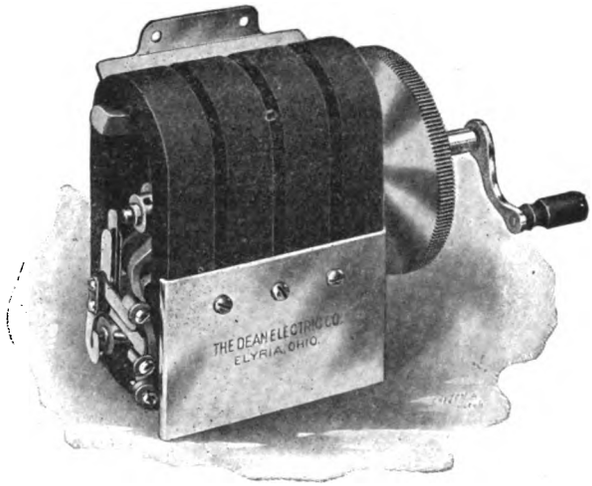
DEAN TELEPHONE APPARATUS

Our Four Bar Generator



This generator is built in a very substantial manner, giving it long life and qualities that in a great many respects make it equal to other five bar generators. It is built for service and will stand up indefinitely under abnormal conditions. These machines, like all of our generators, have laminated armatures, the windings being carefully made and highly insulated to prevent trouble, which often develops where alternating currents are used. By using substantial construction there is absolutely no chance for change of adjustment between the armature and pole pieces during shipment. Many other generators "test out" well before shipment, but upon being received by the purchaser, owing to poor mechanical construction, have shifted, changing the air gap and alignment and greatly reducing their efficiency as a ringing machine.

Quality Switchboard Cable

Is made of 98% Pure Copper tinned wires insulated with best grade Tussah Silk and Cotton, selected, cleaned, refined and dyed by the manufacturer.

The conductivity of the copper wire specified is always maintained—the tinning is smooth, regular, and an increase of .0001" in the diameter of the wire allowed.

Tussah Silk is not used containing more than 3% of extracted matter (oil or loading material) when treated with pure ether.

Cotton used is washed, steamed and boiled at proper temperatures. Analine dyes of the best grade are used in dyeing the cotton, making bright, fast, contrasting permanent colors for the coding of the conductors. The process is under the supervision of experts.

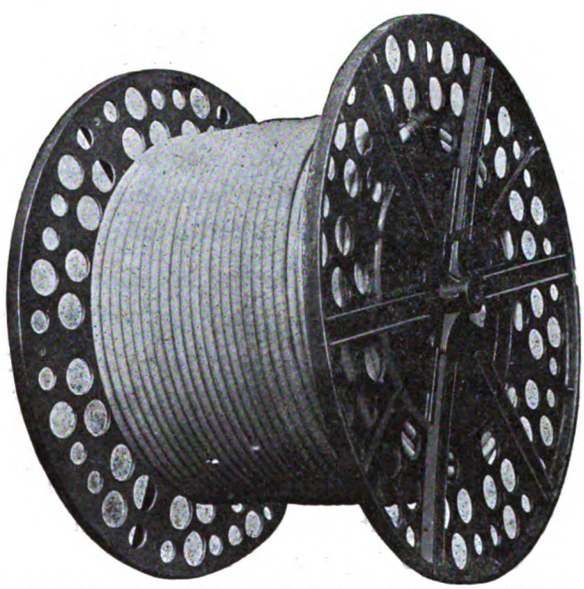
The standard insulation consists of *two* (2) *servings of Tussah Silk* and *one* (1) *serving of cotton,* or one (1) serving of Tussah Silk and two (2) servings of cotton, if preferred.

Standard Cables

5 Pairs.
11 Pairs.
16 Pairs.
21 Pairs.
26 Pairs.
34 Pairs.
41 Pairs.
51 Pairs.

Cables consisting of triple and quadruple conductors furnished when specified.

Flat and round shapes furnished.



100-PAIR SWITCHBOARD CABLE VENTILATING REEL.

Conductors

The "Stromberg-Carlson" Color Code scheme furnishes a different combination of colors for each pair, allowing any pair to be selected from any place in the cable length.

Standard cables are of No. 20 and No. 22 B & S tinned Copper Wire Conductors. No. 24 B & S and combinations of conductors made up subject to special prices.

The process of extracting any moisture and drying before and after painting with our "flame-proof" compound develops an additional external protection that moisture cannot penetrate, and gives us a cable of the highest *insulation resistance.* WE GUARANTEE 500 MEGOHMS PER MILE. This insulation resistance cannot be maintained in the ordinary "painted" switchboard cable *not* hermetically sealed.

We make waxed cables (wet) that maintain a minimum insulation resistance of 200 megohms per mile.

Order cables scientifically manufactured of the finest quality material—it gives the best service.

Write either office for latest prices and samples.

Our Record is Behind Our Batteries

¶ You cannot do better than to profit by the experience of other telephone companies.

¶ Wherever the Gould Telephone Storage Batteries have been installed they have given unqualified satisfaction.

¶ No stronger proof of this can be offered than the flattering number of our REPEAT ORDERS. Ask any Telephone Engineer who has used Gould Batteries and be guided by what HE says.

¶ The construction of the Gould Plate absolutely prevents any loosening or falling out of the active material, thus prolonging the initial capacity far beyond the "life" of other types.

¶ Gould Storage Batteries have high watt efficiency at all practical rates of discharge, and in every detail of their construction and operation conform to the most rigid mechanical and electrical requirements.

¶ A double conducting lug is provided for the Gould Battery Plate, securing a more even distribution of current to all parts of the plate than a single lug. This is but a small detail, but it illustrates the skill with which the Gould Plate is designed and constructed.

¶ This care and skill has been exercised in the construction of every detail—both small and large—of the Gould Storage Batteries, and that is why they have demonstrated beyond all cavil their immense superiority over all other types of storage batteries for use in telephone exchanges.

¶ Saving in space, saving in care and inspection, saving in maintenance cost. These three savings are assured to users of Gould Storage Batteries. They are worthy of your careful consideration.

¶ "Gould Telephone Batteries" is the title of a booklet issued by the Gould Storage Battery Co. It contains many suggestions of practical value to the Telephone Engineer. We shall be glad to mail you a copy free upon request.

¶ ¶ It will pay you to investigate Gould Batteries. Without any cost to you, we will have one of our engineers survey your plant and submit a detailed report with estimate upon the cost and advantages of installing a Gould Battery to do your Work.

All Kellogg Telephono Parts

Are Made From the Best Grades of Material and Are Carefully Assembled by Skilled Workmen, Thus Making Everything High-Grade Throughout

Kellogg Portable Desk Telephone,
For Central Battery or Magneto Use.

The tubular hard-rubber covered standard, with hollow brass shell, nickel plated base, is distinctively KELLOGG.

The transmitter hinges at top of standard, and there is mounted in base the hook switch and hard-rubber terminal block for receiver and desk stand cords.

The hook switch is of the toggle joint type, having a long motion of the springs, thus obtaining most excellent contacts with only a minimum motion of hook.

All necessary parts are properly insulated, are easy of access and everything is made as nearly dust proof as possible.

THIS IS WHY

26-30 ST. CLAIR ST., TOLEDO, O.

Horizontal Telephone Cable Splices

HAVE MANY DISADVANTAGES.

First: You have two masses of solder on each end of the sleeve that have to be carefully wiped, which necessitate the employment of a high priced expert cable splicer. Second:—Your horizontal wiped joint may not be absolutely moisture proof. Third—When it is necessary to open a joint the solder has to be blown off of both ends and the sleeve moved back or cut. Fourth—It is difficult to get at the inside pairs. Fifth—The sleeve must be moved over the spliced pairs and both ends carefully soldered and wiped when a test or repair is finished. Sixth—It does not admit of changing of multiples without removing the sleeve and solder. Seventh—It takes at least two feet more room in a manhole in underground cable construction. Eighth—It costs more on first installation.

No. 1.

No. 2.

No. 3.

Compare the above with the ease and economy with which a joint can be made when you use

HARGIS CABLE SPLICING JOINTS

By referring to the six pictures and the following descriptive matter you will get a good idea of its advantages over the old style horizontal wiped joint. No. 1—Showing method of putting cable through lead gasket and brass collar before soldering. Note the cup thus formed. No. 2—The solder at a little above wiping heat is then poured into the cup and any roughness removed by a blow torch and wiping cloth. No. 3—The armor is then taken off the cable and the wires boiled out with paraffine. No. 4—The wires are then spliced as usual, only with greater ease. No. 5—Shows the appearance of the H. S. J. when the pairs are laced ready to be enclosed by the lead casing. No. 6—The joint is completed by screwing the sleeve tight with the spanner wrenches.

Made in three sizes. Costs less on first installation. Saves money while in use. Send in your order to-day.

No. 4.

No. 5.

No. 6.

TELEPHONE SUPPLIES

Immediate Shipment of Orders for Heavy Line Construction Material

HIGHEST GRADE QUICKEST DELIVERIES

DOUBLEDAY-HILL ELECTRIC CO.,

PITTSBURG, PA.

"It might interest you

to know that the total maintenance expense of parts for our entire plant of 3,000 switches for the past eighteen months has been $10.24," writes Supt. J. A. Duncan, of the Sioux City Telephone Company, Sioux City, Iowa. (This company operates our AUTOMATIC TELEPHONE SYSTEM.)

"A like sum

would perhaps take care of the repair cost on operators' chairs in a manual exchange of the same size," adds Mr. Duncan. (We'll be glad to send you a copy of his letter if you'd like to see it.)

It occurs to us

that the one item of switchboard cords alone for a manual exchange of 3,000 lines would amount to at least $150 in eighteen months. That is fifteen times the cost of all repair parts on the Sioux City automatic exchange.

That is only one

of the many economies of the AUTOMATIC SYSTEM. These economies all help to swell the profits. And—the AUTOMATIC, being the best service, commands the highest rates. Low production cost plus high selling price equals big dividends. That is what led to the adoption of the AUTOMATIC TELEPHONE SYSTEM in the following cities:

Aberdeen, S. D.
Akron, Ohio.
Allentown, Pa.
Auburn, Me.
Auburn, N. Y.
Battle Creek, Mich.
Beaver Falls, Pa.
Bellingham, Wash.
Butte, Mont.
Cadillac, Mich.

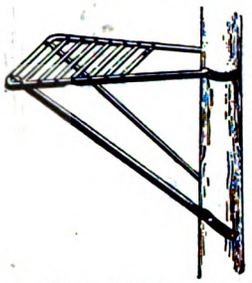
SECURITY POLE SEATS WILL OUTLAST THE POLE ITSELF



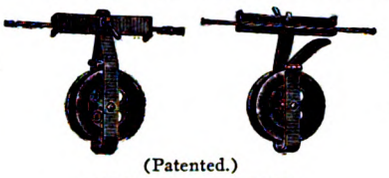
Can't say that of the other kinds, can you? Security Seats can be easily and quickly secured to the pole without the slightest injury to the pole. They never split, crack, or break under strain or weather as do the other kinds. And remember that they are cheaper than the rest.

Any reason now why you shouldn't buy the Security?

As a further incentive, get our Security Book.

THE F. BISSELL COMPANY, TOLEDO, O.
226-230 Huron St.

WHAT'S THAT—TWO MEN PULL 1,000 FEET OF CABLE IN 10 MINUTES?



It doesn't seem possible, you'll say—but it IS possible.

It all depends upon the trolleys you use.

(Patented.)

SECURITY TROLLEYS

are made of the best iron. They will accommodate *any* size cable. They're very cheap and will last practically forever.

Our Security Book tells all about them. Get it.

THE F. BISSELL COMPANY, TOLEDO, O.
226-230 Huron St.

Security Sundries For Cable Splicing

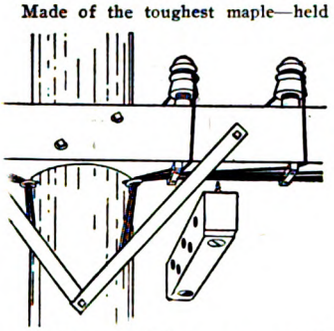
Shave Hook for scraping lead sleeves, *Boxwood Dresser* for shaping lead sleeves and *Boxwood Pin* for expanding lead sleeves. We carry them all in stock. If you'll write to-day for prices and further information we can ship immediately.

Address

THE F. BISSELL COMPANY
TOLEDO, O.
226-230 Huron St.

SECURITY SPIDER WIRE CLEATS

Made of the toughest maple—held by screws or nails—and drilled to accommodate five wires.



They're just the thing to insure neat looking, well wearing, pole work. Cost? 1,000 for only $5.00.

Our security book gives further facts and prices about this and all our other Security Specialties—you should have it in your files. Write for it to-day.

THE F. BISSELL COMPANY, TOLEDO, O.
226-230 Huron St.

OLD STYLE CONDUIT RODS vs. SECURITY CONDUIT RODS

The old style rods were all right if they didn't break so easily—if they weren't so hard to join and if they didn't jam at the wrong moment. Yes—and if they didn't cost so much.

And the more trouble you had with an old style rod the more will you appreciate the new, safe Security Conduit Rods. And please remember that Security Rods are extremely cheap. Our Security Book gives figures and facts—will you write for it?

THE F. BISSELL COMPANY
TOLEDO, O.
226-230 Huron St.

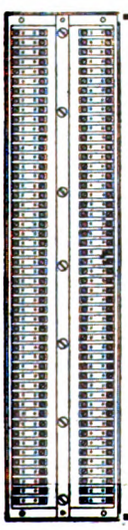
SECURITY MANHOLE GUARDS

They should be called "Security *Safety*" guards—because they're the safest, strongest, sightliest guards built. Yes, and better than all this—they are collapsible—take little room when folded—but when fastened upright cannot be unjointed by accident.

They do not cost much either. You should let us tell you more about them.

We sell the manhole tops, too.

THE F. BISSELL COMPANY, TOLEDO, O.
226-230 Huron St.



This Should Interest You

Security Cable Distributing Panels!

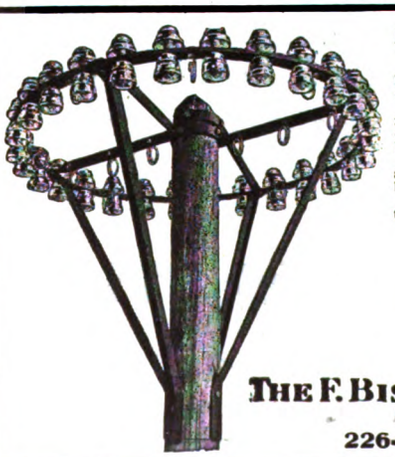
They are splendidly made. Can be used for pole house work or for the telephone exchange.

No other panel quite so convenient, compact and economical.

We make them for any number of conductors. Please order by conductor.

Prices and particulars in our Security Book. Get it.

THE F. BISSELL COMPANY
TOLEDO, O.
226-230 Huron St.



SECURITY POLE DISTRIBUTING RINGS

have distinct and decided advantages over all others.

Why? Because they afford better connections; because they are stronger; because they mean better insulation and because they are very cheap.

We make many different sizes. They all fit the top of the pole or any point below it.

Why not get our Security Book?—it tells all about them.

THE F. BISSELL COMPANY
TOLEDO, O.
226-230 Huron St.

Actual Size of Instrument. Three in One—Ammeter, High and Low Reading Voltmeter.

Every Exchange Needs One

If you use one of our voltmeters once, you will acquire the voltmeter habit and never give it up.

Do You Know

that the instrument shown on the right gives both volt and ampere readings?

That you can use it for the measurement of resistances?

That it is low in price?

That it is accurate?

New Switchboard Instrument.

That our triple scale instruments will measure the voltage of a single cell or that of an electric light main?

That you can measure the resistance of your lines with it?

That you can measure the resistance of your ringers and induction coils with it?

That you can test insulation up to 100,000 ohms with it?

Yet the cost is low and if you write us we will make a price that you can afford to pay.

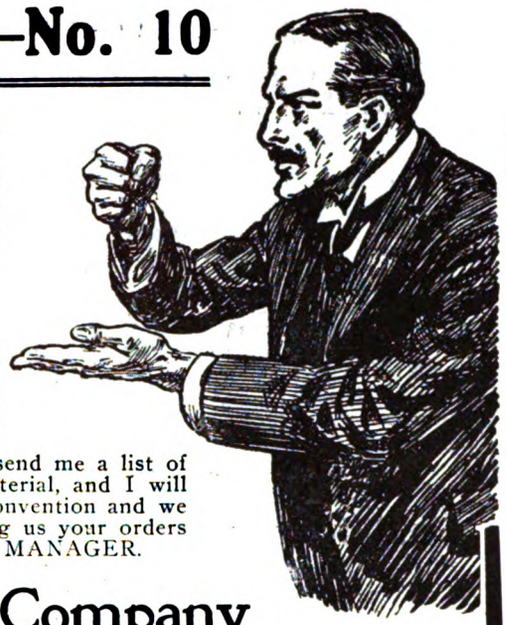
Talks With The Buyer—No. 10



Well, the Glorious Hurrah of the National Convention is over. I will have to wait a minute to catch my breath. There was the enthusiasm of numbers, the glowing reports of success in the field, the interesting exhibits, described in detail on other pages of this paper, that one round of pleasure at Sans Souci Park, plenty to eat and witty speeches at the banquet, and the side trips of which no mention will be made. But, then, you were there, of course. If you were not, you missed the time of your life.

DID YOU GET YOURS?

If you were at the Convention you must have been in our exhibit. If so, you "got yours." If you were not at the Convention write me and I will send it to you. Right over the mysterious box in our exhibit there was a sign which said: "We Are Not In The Advertising Business. We Advertise To Get Business," which is the moral of this story.

When you write and tell me you were not at the Convention, send me a list of your telephone requirements, either instruments or construction material, and I will quote you prices when sending you "yours." If you were at the Convention and we had an opportunity of talking over matters, I know you are sending us your orders already.

NOT WHAT YOU ARE USING NOW
BUT WHAT YOU WILL USE EVENTUALLY

Because it is what your subscribers want

THE LIVERMORE
ONE-SLOT PAY STATION

Practical telephone men who have seen and tried it, cannot find a flaw.

Levers and superfluous slots eliminated.

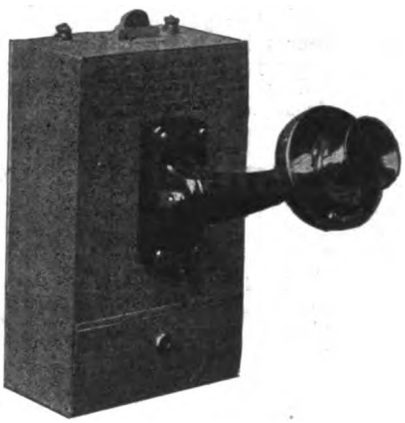
There are no air pumps.

No springs.

No knives.

No clock work.

No push buttons.



NOTHING FOR THE SUBSCRIBER TO DO BUT DROP THE COIN—

Any coin or coins mentioned by the operator—in one-slot. Whatever noise is occasioned by the dropping of the coins in the slot and their passage through the chutes is confined to the box at the sub-station.

The transmitter and the signals are mounted on a bell resonator insulated from the box and the coin chutes.

The desirable result of loud, clear signals to the operator minus all outside rattling and pounding is thus achieved.

You had better investigate the

LIVERMORE ONE-SLOT PAY STATION

now and get your order in early for prompt delivery.

LIVERMORE PAY STATION CO.

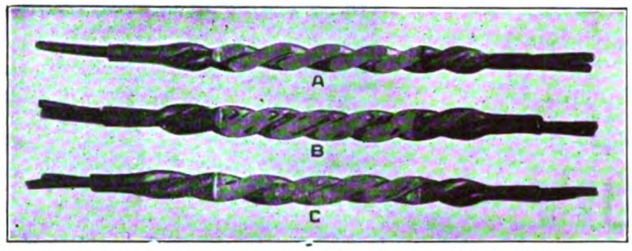
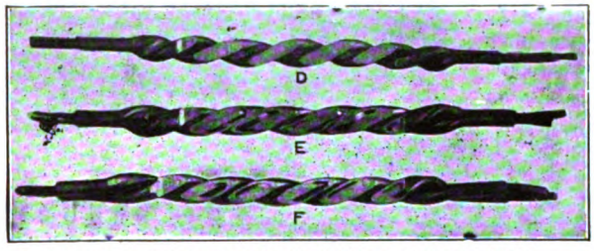
Here's the whole story

These cuts are from photographs that have NOT been retouched.

(Photographs show joints after twisting filed half through longitudinally.)



A—COOK NUMBER 10 JOINT WITH NO. 10 WIRE
B—COMPETITOR 1—NO. 10 JOINT WITH NO. 10 WIRE
C—COMPETITOR 2—NO. 10 JOINT WITH NO. 10 WIRE



D—COOK NUMBER 10 SLEEVE WITH 10 AND 12 WIRE
E—COMPETITOR 1—NO 10 SLEEVE WITH 10 AND 12 WIRE
F—COMPETITOR 2—NO 10 SLEEVE WITH 10 AND 12 WIRE

It's the flat side that does it.

There's no mistaking the moral to this story. The only way to secure such an absolute union between sleeve and wire is to use the

COOK SELF WELDING WIRE JOINT

No other joint draws up to the wire and stretches tight around it. Other joints when twisted leave air spaces that lead to corrosion and consequent deterioration.

For permanently perfect joints, specify Cook's.

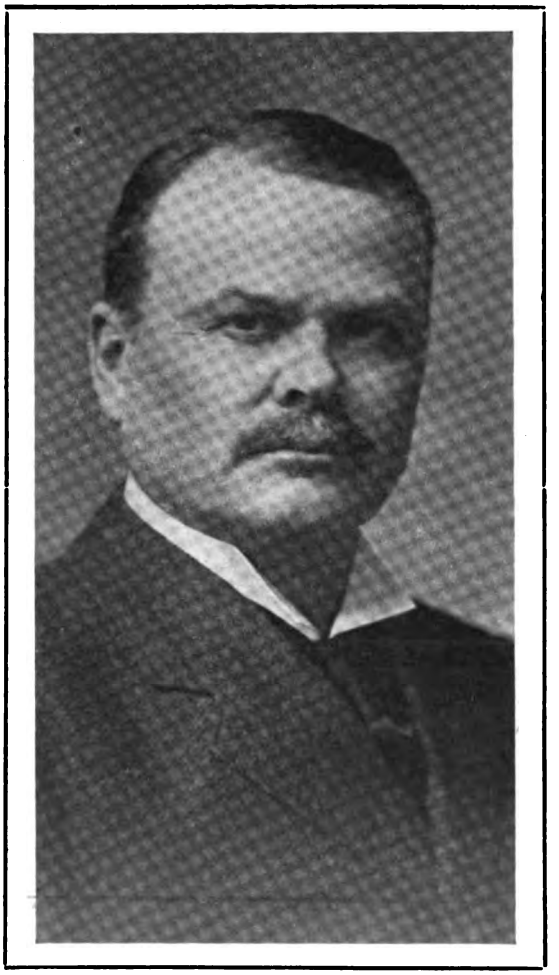
The 1907 Independent Telephone Convention

THE annual convention of the International Independent Telephone Association was held at the Auditorium, Chicago, June 3-6. All of Monday and Tuesday afternoon was given over to the meetings of standing committees. The convention proper began Tuesday afternoon. The assembled delegates were called to order by President James B. Hoge of Cleveland, Ohio. At that time the convention hall was filled with workers in the field of Independent telephony. It was a representative gathering, the attendance and interest manifested augurring well for the interest which is felt in the Independent movement everywhere.

Chicago's new mayor, Hon. F. A. Busse, was not present in person to welcome the telephone men, but he was ably represented by Dr. Evans, Commissioner of Health for the city.

Dr. Evans expressed the regret of the Mayor that he could not be present, and in his behalf and that of the city he extended a hearty welcome. After referring to the immense development of Independent telephony, he spoke of the appropriateness of such an organization meeting in the great city of Chicago, which had been foremost in industrial development.

Dr. Evans was followed by John M. Glenn, secretary of the Illinois Manufacturers' Association, which has been seeking to establish a local system and a terminal for Independent long distance lines in the city. He said that his association was in sympathy with the Independent movement and desired to get in touch with the Independent exchanges. The business of Chicago, amounting to $1,500,000,000, he said, is now dependent upon the Bell monopoly. Mr. Glenn then briefly outlined the history of the commercial association's struggle to get a franchise in Chicago. In behalf of the Manufacturers' Association he extended a hearty welcome.



Theodore Gary, President of the International Independent Telephone Association.

Mr. H. D. Critchfield, of Milwaukee, responded to the welcoming addresses. He stated that he was glad to know that Chicago had awakened to the magnitude of the Independent movement, and expressed sympathy with the Manufacturers' Association for its failure to secure a local franchise. The general proposition that a competing telephone system is a duplication and a burden he declared to be incorrect.

The greatest growth of the Independent systems has been in 1906. There are within 500 miles of Chicago 1,200,000 Independent telephones. There are in the same territory less than 650,000 Bell telephones. Chicago now, therefore, deprives the 1,200,000 Independent telephone users from doing business with the city. No man, he insisted, has to take two telephones. He only takes the second telephone when it is to his financial advantage to do so. The result of a second system in Chicago would be a doubling of the telephone users in the city, not a division of the present users.

At the close of Mr. Critchfield's remarks, which were received with great enthusiasm, the annual convention photograph was taken. In this connection there was a very pleasing diversion. At the explosion of the flashlight a series of American flags unrolled and fell into view, while the delegates showed their pleasure by applause.

James B. Hoge then read what he declared to be his last address as president of the telephone association.

Assistant Secretary J. A. Harney read his annual report after Mr. Hoge had finished.

During this session short talks on practical subjects brought out interesting remarks from a number of members. Mr. C. E. Tarte, of Michigan, felt that it would be better to buy copper even at the present prices rather than to longer delay needed construction. He urged upon all to go ahead in construction work to meet the ever-increasing demand for new telephones and long distance connections.

Mr. Sumner, of Oregon, said that construction work in Oregon and Washington was progressing rapidly.

Charles West of Pennsylvania aroused considerable indignation by a report that his state had enacted a statute prohibiting the use of the shield. Senator Kline, however, stated that the act was simply to avoid the desecration of the American flag and did not apply to the present use of the shield showing the American colors.

J. B. Rhodes, of Ohio, spoke on methods of collecting, emphasizing the necessity to first give good service and then keep constantly hammering.

The Wednesday Morning Session.

The attendance at the morning session of the convention on

Digitized by Google

Wednesday, which was called to order at 10:30 o'clock by President James B. Hoge, was very flattering. Nearly every seat in the convention hall was filled and the business of the session proved unusually interesting to the delegates. Owing to the large amount of business and the spirited discussion brought about by certain resolutions and the one paper of the morning, the business extended into the afternoon meeting.

The session opened with a report of the entertainment committee. Frank W. Pardee, Chicago, chairman of the committee, reported that one thousand tickets were secured for the delegates to attend the various entertainments at Sans Souci Park, but owing to the disagreeable weather only a very few were present. He also announced the annual banquet, which was held in the banquet hall of the Auditorium Wednesday evening.

The one paper of the morning which was read was "Independent Improvements and Possibilities," by C. E. Tarte, of Grand Rapids, Michigan. Mr. Tarte's paper was well received and he was loudly applauded at the conclusion.

Mr. Tarte's paper was discussed by several of the delegates and this was a very interesting part of the morning session. C. W. Kline, of Hazelton, Pa., opened the discussion, and the substance of his remarks was that the Independent companies must get together and help one another. Several other delegates followed with interesting discussions on the subject, and these were listened to with intense interest.

The next order of business taken up was the report of the committee on resolutions. These were read and presented by C. W. Kline of Pennsylvania. They were unanimously adopted, especially the one extending a vote of thanks to James B. Hoge, who has served the International Independent Telephone Association as its president for the past three years. This was adopted by a rising vote. The resolutions were as follows:

WHEREAS, The Bell Telephone Company is insidiously proposing long distance connection to local Independent telephone companies in various parts of the United States and offering in consideration of entering into such connection to abandon the local field; and

WHEREAS, It is the sense of this convention that any such connection is bound to injure the Independent telephone cause as a whole; therefore, be it

Resolved, That this association frowns upon and denounces any affiliation or connection of Independent telephone companies with the Bell company anywhere on the American continent as being injurious to the people as a whole.

WHEREAS, There are difficulties and dissensions arising from an infringement by an Independent company on the territory already occupied and served by another Independent company; and

WHEREAS, Such infringement is injurious to the cause of Independent telephony; therefore, be it

Resolved, As the sense of this convention, that the company on the ground and satisfactorily serving the public shall be entitled to recognition by this association and any company or individual infringing on the rights of such Independent company shall be repudiated and shall not be admitted to membership in this association.

WHEREAS, Jas. B. Hoge has well and faithfully served the International Independent Telephone Association as president for the past three years, giving freely of his time and means to advance the interests and further the cause of Independent telephony, and

WHEREAS, We fully appreciate his invaluable services to the association; therefore, be it

Resolved, That this convention tenders to Jas. B. Hoge a unanimous vote of thanks for his able services in so successfully organizing and presiding over the destinies of the association for the past three years and that the secretary of the association is hereby instructed to have a copy of this resolution engrossed and presented to Mr. Hoge as a testimonial to the present as well as to all future generations of the high regard in which he is held by this association.

President Hoge responded feelingly and thanked the association for the honor extended, and praised the association for the work it has done during the past three years. He said that his sole object since he has been serving as president of the International Independent Telephone Association was to bring about a condition of affairs whereby the Independent companies would pull together in their work, and that he was gratified to see that this had been done. He also stated that the organization was not one person's organization, but the Independent Telephone organization, and urged that its power be used rightly, and not for politics. Mr. Hoge stated that he noticed the difference in the class of men attending the convention since its first meeting, that is, as to the difference in the ages of the men. On taking his seat he thanked the delegates as retiring president for their work in building up the organization.

The remarks of President Hoge were followed by the written reports of the state, territorial and provincial associations. These were brief, but interesting. Adjournment was then taken for the noon luncheon.

The Wednesday Afternoon Session.

AT two o'clock on Wednesday the afternoon session convened, taking up the roll call of states. Mr. Nelson, reporting for Kansas, stated that as a feature at the recent convention in his state fifty of his company's operators were invited and attended. It was made a practical convention, oratory was done away with, and the members attended to business in a way that will produce much good.

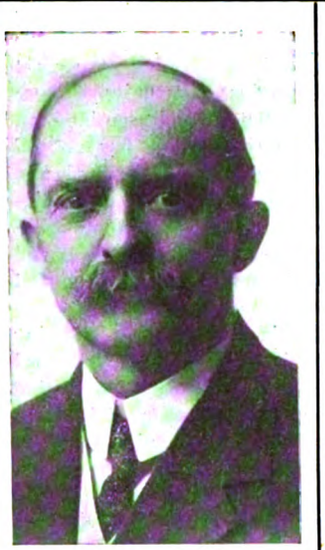
Secretary Deering, of the Iowa Association, said the telephone business has increased rapidly in Iowa. No less than 2,500 companies reported during the past year for taxation. A state agent had been appointed and his work is very helpful. A great many companies in his state are anxious to see a plan for an organized campaign of publicity introduced by the association.

Delegates to the 1907 Convention of the International Independent Telephone Association Assembled in the Auditorium, Chicago.

Digitized by Google

Charles E. Sumner, Oregon, Elected 2d Vice-President.

Frank L. Beam, Ohio, Elected 1st Vice-President.



Manford Savage, Illinois, Elected Treasurer.

W. B. Woodbury, Gen'l Manager Detroit Home Telephone Company.

For Kentucky Mr. Overly reported. The Kentucky Association has twenty-seven members. Although only organized last year, it is gradually growing and prospering. There are now 50,000 Independent telephones in the state.

E. B. Fisher, president of the Michigan Association, made a very interesting report, stating that last March a definite organization was perfected. In the Southern Peninsula the Independents now have 428 exchanges, 1,089 toll points. In the entire state there are 70,000 telephones in operation. He urged other states to join in a movement for developing interstate service. His state hopes to have connection with Chicago soon.

Charles S. Norton, of Indiana, reported for his state as follows: The Independent telephone movement in Indiana is now more firmly entrenched than at any previous time; the Independents were never more independent. The state has been deluged by tracts and newspaper articles arguing, pleading with subscribers and the public for a single telephone system. Notwithstanding this the Independents have remained loyal. In the meantime several sub-licensee companies have severed their connection with the Bell lines, and now connect with the Independents exclusively. There is now but little territory in Indiana unoccupied by Independents. In forty out of ninety-two counties of the State there is little or no opposition. During the past year the companies have devoted their energies chiefly to improving and extending exchanges and toll lines. There has been an increase of 10,421 subscribers and 1,200 circuit miles of toll lines, requiring an additional investment of $1,139,996. It is now possible for any Independent company to have commercial toll service with every other Independent company in the state. Earnings show a remarkable increase. While the added investment is only 8 per cent, the gross earnings amount to $3,270,114. This increase of 16½ per cent, or $467,550, indicates much better management, and shows how the companies are fast perfecting their knowledge of methods of handling their business. Out of 385 Independent companies in the state, the only one which has gone into liquidation during the past year is a sub-licensee. The Indiana Association is now in fine form. Not a member has withdrawn during the year and there has been an increase of twenty-seven members. The total membership is 145 companies, representing nine-tenths of the entire Independent telephone investment in the state. For revenue the association is dependent entirely upon assessments from member companies. All obligations are promptly met and the year closed with a good balance in the treasury.

The report for Arkansas, made by Mr. Askin, showed good progress for the year, and largely increased membership. A law granting the right to condemn railway rights of way has been found very useful.

Houck McHenry, of Jefferson City, Mo., was next with an interesting report, dealing with a variety of features connected with his state.

For Nebraska, R. E. Mattison reported, stating that Nebraska has 90,000 telephones and 3,000 miles of toll lines. The most successful enterprise of the year was the publication of a state directory, which brought many subscribers.

Mr. F. L. Beam, for Ohio, reported eighty-eight counties developed, and every county well equipped with Independent telephones, with the sole exception of Hamilton. The growth for the year shows 4,296 instruments.

J. S. Brailey, Jr., of Toledo, Ohio, spoke on the subject, "The Strength of the Chain," and made a profound impression on his hearers.

For Oregon, Mr. Têtu gave a very interesting report. He said his company is ready to give Independent service in Portland and adjoining cities. Service has already been extended to Tacoma, Seattle and Walla Walla in Washington.

Charles West, of Pennsylvania, next reported, saying that there are 160,000 Independent telephones in the state, with 4,153 toll stations and 328,000 miles of toll circuits. President Folsom, of the Keystone Company of Philadelphia, read a paper stating that his company showed substantial growth. During the past year the switchboard capacity in the city has been increased 4,200 lines. At Camden, N. J., a new building is under construction and fifteen miles of new subway has been commenced. In one nearby small town a central energy plant is under construction.

S. C. Thayer, of Beaver Falls, Pennsylvania, spoke briefly, stating that the telephone business is prosperous in his territory.

For Virginia, B. L. Fisher reported progress. He said that his state has one hundred Independent companies.

J. Walter Barnes, of West Virginia, gave an interesting report of development in the Mountain State.

G. W. Buzzell, representing Vermont and New Hampshire, unable to be present on account of illness, sent a cheering message. Both Vermont and New Hampshire recently granted Independent franchises in several large towns. All that is lacked by Vermont and New Hampshire is trunk line connections to Boston and New York, to enable them to successfully cope with their competitor in long distance work. Locally they are more than able to hold their own now. During this season they will finish a trunk line from St. Johnsbury, Vt., to Laconia, N. H. At the last session of the Vermont legislature a law was passed giving all telephone companies equal rights in placing telephones in railroad stations.

F. E. Ebersole, of Portland, Me., reported prospects brighter to-day than a year ago. A permanent state organization was formed at Lewiston last March, with representation from eight thousand telephones and fourteen companies. All companies represented, with the exception of the Northeastern, were

Digitized by Google

originally organized as farmers' or mutual companies. These companies have extended their lines until they cover a large territory and are joined together by toll lines. Along the coast line Maine has seven or eight Independent companies. There is also a large company operating fifteen to eighteen hundred telephones in the northern end of the state which has no toll service. Besides these, there are a few scattered companies in various parts, operating under adverse conditions, but still maintaining their independence. At the present time there are probably 18,000 Independent telephones in operation in the state and about 6,500 telephones now controlled by sub-licensees of the Bell company.

A report of the situation in California disclosed the following facts: The emancipation of the Pacific Coast from Bell control dates back four years, when F. F. Graves commenced operating the Los Angeles plant. Development and progress of business has been a triumphant march over southern California. In a territory one hundred miles square there are operating at present forty-two exchanges in thirty-nine towns, with a total of 54,000 telephones. The Bell company has in the same district 43,700 telephones.

In 80 per cent of the Independent exchanges the average rate is considerably higher than that of the Bell company. Los Angeles, having 60,000 telephones in service, counting both companies, gives one telephone to each four persons, while Pomona, with a population of 7,500, has over 2,000 Independent telephones and 150 Bell. In the following towns the proportion of Independent to Bell telephones is high: Whittier, 850 Home, 15 Bell; Downey, 175 to 4; Compton, 400 to 2; San Fernando, 125 to 1; Covino, 700 to 3; Monrovia, 655 to 40. Plants at Oakland and Berkeley have been completed. San Francisco has granted a franchise to the Independents and construction is proceeding rapidly. Independent long distance connections are complete.

J. S. Haley, of Livingston, Mont., reported for his state.

A motion was made and carried to accept all reports and place them on file. At the conclusion of the roll call C. W. Kline, chairman of the committee on resolutions, presented a resolution which was adopted as follows:

WHEREAS, Independent telephone journals of this country have rendered the cause of Independent telephony invaluable service by constantly placing before the public the whole truth in regard to the movement, and

WHEREAS, We fully appreciate the great work they have constantly engaged in; therefore, be it

Resolved, That this convention extends to them its hearty thanks for their past efforts, and to encourage further efforts recommends that the rank and file in the Independent field support them loyally by patronage and subscription. Presented by D. A. Walker, Ohio, seconded by Edward E. Clement, Washington, D. C.

Before adjournment William A. Wynne, of Raleigh, N. C., and E. B. Fisher, of Michigan, made a few remarks. J. P. Boylan, of Detroit, Mich., presented the report of the Standard Operating Rules and Regulations Committee.

Climax of Good Feeling at the Banquet.

As a grand climax to a great day in the history of the Independent Telephone Association, the banquet, which is always the most notable annual feature of the convention, was held Wednesday night in the banquet hall of the Auditorium Hotel. Fully three hundred loyal Independents gathered under the incandescent studded dome of the hall and enjoyed a bountiful repast. The entertainment committee, Frank W. Pardee, chairman, certainly did the right thing in their admirable selection of delicious eatables. While dinner was being served music was furnished by the famous Chicago Thomas' Orchestra, and the songs by the Weber male quartette were probably the hit of the evening. Several songs, new and old, were rendered after each toast. C. W. Kline,, of Pennsylvania, filled the toastmaster's chair most gracefully. After congratulating the International Association on both the number and high character of the attending delegates, he introduced the first speaker of the evening, the silver tongued orator from Nashville, Mr. Luke Lee. Mr. Lee eloquently responded to the toast "The New South." Said he: "Tennessee stands stretching out her arms to the Independents. The Independent movement is new in our section. Few cities have competitive exchanges, Memphis and Knoxville being exceptions. The losing of the fight for a franchise in Nashville by E. L. Barber and his associates was necessary to the winning of the greatest victory, which came with the passage of a state law making it possible for a company incorporated in Tennessee, to construct plants in every city and town without securing a municipal franchise. Mr. Lee told how such a law had been passed by the people of the state working through specially elected state senators and representatives. After the campaign, bribery, graft and treachery in which the people's will was ignored time after time were exposed. The telephone situation in Tennessee is no longer a municipal affair, but one concerning the state. There is a flourishing Independent exchange in Memphis, the Bell being practically defeated there, but at present only the Bell exchange in Nashville." Mr. Lee concluded by a stirring appeal to Independent operators not to be misled into thinking the object of their being is to duplicate Bell mismanagement or high rates. Independent telephony must be grounded on a real demand for more telephones. This is

Address of President Jas. B. Hoge*

THE best information that I can obtain shows that there has been an increase in our system of more than 500,000 telephones during the past year. Franchises have been granted by overwhelming votes in the following large cities: Boston, Mass.; San Francisco, Cal.; Milwaukee, Wis.; Denver, Colo.; Omaha, Neb.; Springfield, Mass.; Nashville, Tenn.; and a number of smaller cities, thus leaving but a few centers of population where the Independents do not have adequate terminals arranged for.

In a number of states the interests represented by us have had, during the past year, all sorts of propositions made them to sell out, to consolidate, to become sub-licensees and even to purchase Bell exchanges; but with very few exceptions, and those few of minor importance, they have stood firmly by the principles of the association, refusing all overtures intended to weaken our cause; and, furthermore, a number who heretofore were sub-licensees of our competitor throughout the country have rejoined the Independent ranks, so that to-day we are much stronger than even one year ago.

Year of Prosperity, with Dividends.

The year has been one of increased prosperity among the Independent companies. Most of the companies have placed their properties on a dividend-paying basis, having decided to stop putting all their earnings into extensions and betterments as was the custom during the early days of Independent developments. Most of them, however, are content to pay reasonable dividends and then put a substantial surplus back into the properties for extensions and betterments. In almost all cases investigated I find this amount to be equivalent to from 3 per cent. to 10 per cent. on the capital stock of the company. Co-operative companies in many cases have been incorporated and placed upon a business basis, and are now employing proper help and paying dividends. Our business and securities have become better understood during the year.

Facts for Newspapers.

The association has furnished a large amount of information, which was gathered by constantly urging the importance of sending it in, to many of the Eastern papers as well as the papers throughout the other sections of the country, and to-day a substantial percentage of the United States understands and believes that Independent telephony is here to stay, that there is a place for two telephone systems, and that two telephone companies can get along in the same community as well as two telegraph companies.

Competition and Duplication.

Twelve cities with competition, representing a population of over 2,000,000, show a development of one telephone for 7.4 population, while the same number of cities without competition, with a population of 650,000, show one telephone to 23.8 population, with very much higher rates and unsatisfactory service.

A careful analysis of duplication of telephones in the following cities shows an average of only 12 per cent.: Columbus, Cleveland, Dayton, Indianapolis, Kansas City, Louisville, Minneapolis, Toledo.

Mr. Nichols, in his New York report, claims an average of about 15 per cent. in thirty-six cities. Every one will agree, I think, that if the two systems were owned and operated by the same company it would not be possible to save more than one-half of this duplication, for the reason that a majority of the business houses and offices do not have any more telephones to-day than are necessary to adequately take care of the business, so that in reality there is possibly a duplication that could be avoided of approximately 7 per cent. In other words, the general public is given more than 300 per cent. greater use of the telephone where there is competition than where competition does not exist, at lower rates, and far superior service, with a possible waste from duplication of only 7 per cent.

Independent Securities Withstand Attack.

Securities of many public-serving corporations of the United States have declined during the past ninety days from 10 to 30 points, but Independent telephone securities seem to have withstood the attack during this period with slight loss.

Compulsory Interconnection.

Without organization the legislatures in many of the states would be inclined to pass measures unreasonable and unjust to our interests, not to impose a burden on us, but through lack of information on the part of those introducing them. For instance, compulsory interconnection bills have been introduced into a number of the legislatures during the past year and the subject is being agitated by the press of almost every state where the Independents have a strong foothold. In most of the central, western, northwestern and southwestern states bills have been introduced during the legislative sessions just closed,

* Abstracted.

Ralph Reamer, Treasurer of the Ohio Association.

C. C. Deering, Secretary of the Iowa Association.

F. H. Woods, President of the Nebraska Association.

Digitized by Google

providing for compulsory connection. In states whose legislatures will not meet until next winter similar bills will be introduced. The officers of the various state associations should at once inaugurate a campaign of publicity, pointing out the injustice of compulsory connection, which is an interference with private property rights, and would have a tendency to stop all further development of long distance lines. Stockholders of local companies should be informed by the managers of their respective systems of the operating disadvantages incident to compulsory connection, so that they can present the Independent side of the controversy intelligently to their representatives in the state legislatures. In all matters pertaining to legislative affairs telephone operators should secure the co-operation of their stockholders, because from a political point of view they have more influence than the man actively engaged in the management of the business.

Publicity Department.

The Executive Committee at its last meeting voted to establish a publicity department, which, in the judgment of the members of this committee, is of vital importance, in order that authentic information may be prepared to keep the press of the country properly informed with a view of strengthening our securities and educating the public to our business; the press department not to be used for the purpose of fighting our competitor, except in cases where our cause is misrepresented or unduly attacked by them; its principal purpose should, however, be constructive and in no sense destructive.

The necessity for this organization is well illustrated in the work being done by the local Chambers of Commerce in the various cities, which are supplemented by the State Board of Trade, and these by the National Board of Trade.

Measured Service.

Telephone service which up to the present time has been given almost exclusively on a flat rate basis by the Independent companies is subject to the same abuses and waste as the unchecked supply of electric current, gas and water; and there is unquestionably a growing demand on the part of the consumers as well as the management of the companies to have the service placed on a meter basis that will equalize charges between the various consumers, and eliminate many of the annoyances to which the business is now subject.

Long Distance Lines.

The year's record on long distance work shows up very favorably as compared with that of previous years. The high price of copper during the past six months has been responsible for closing down considerable construction work that would otherwise have been done. The various long distance companies are gradually increasing their earnings by leasing their circuits to brokers, manufacturers, newspapers and others for telegraph purposes.

In this connection, I would call your attention to the fact that statistics show that over 85 per cent. of the long distance messages are for points within a radius of 50 miles of the originating station, and might further state that the great majority of local companies are provided with adequate facilities for furnishing such connections.

Traveling Secretary Needed.

It has been frequently suggested that the association should have a traveling secretary who would give at least a portion, if not all of his time to visiting the different state associations for the purpose of working out more uniform methods in the various states, helping to strengthen the state organizations and attending their annual conventions. During the early part of this year we had Mr. Stadelman, of Iowa, visit a number of the state conventions, and the reports we received in Cleveland of his work indicated to us that such a plan could be made very effective. It has also been suggested that the various state associations should arrange a schedule for dates for holding their annual conventions, to be arranged one or two weeks apart and with some regular order, so that the traveling officer as well as any others who might be able to attend one or more of the conventions would be able to do so and minimize traveling expenses.

Contributions for Association Work.

Our present constitution provides for assessments to be levied against the various state organizations on a basis of not to exceed 1c. per unit per year. A number of the manufacturers have expressed a desire to place stamps, to be furnished by the association, on a basis of 1c. per unit on each telephone and each switchboard drop, while certain manufacturers of telephone supplies have announced their willingness to contribute one-twentieth of 1 per cent. of their gross receipts from the Independent telephone interests. This plan has been discussed with a number of the leading operators and they feel that it is one that will probably equalize contributions from the supply houses and manufacturers better than any other.

REPORT OF AUDITING COMMITTEE.

The Auditing Committee, through its chairman, Charles West, of Pennsylvania, reported that the total receipts from June 26, 1906, up to and including May 25, 1907, amounted to $17,444.11; that there was a cash balance on hand June 16 of $1,113.73, making a total of $18,557.84.

W. R. Campbell, Prominent in New York Independent Telephone Affairs.

George T. Hewes, Manager of the Successful Iowa Clearing House.

P. C. Holdoegel, President of the Iowa Independent Telephone Association.

The committee found the total disbursements amount to $18,241.60, leaving a balance in the treasury amounting to $316.24.

The total assets of the association amount to $4,254.39 and the total liabilities to $5,845.51, leaving a deficit of $1,691.12, has since been provided for through the successful efforts of the finance committee.

The Report of the Assistant Secretary*

OUR card record of Independent companies has been increased by 2,642 names, so that it contains at present the names of 10,042 companies, all of which are strictly Independent, according to the best information obtainable. We have recently secured a list of over 10,000 cities and towns having Independent service, with the name of the company at each place, also considerable information regarding the organization of new Independent companies.

Supply Department.

During the past year this department again demonstrated its value in carrying out the purpose for which it was organized, namely, standardizing and extending the use of the official shield. Up to date the association has furnished shield supplies to Independent companies in forty-four States. The supply department was never intended primarily as a money maker, and has not been operated as such.

As a matter of general information, I am instructed to announce that it has never been the intention of the association in establishing the supply department to make it a general purchasing agency for the Independent interests. Shield supplies only have been handled, and on a number of occasions, both before and since the last convention, we have refused the agency of various accessories which were offered us.

Map Department.

Information has been received from and spotted on tracings for forty-two States, and we can furnish printed maps or blue prints showing from forty to ninety per cent of the existing Independent toll line development for fifteen States, and a special blue print showing important long distance connections in the territory from central Nebraska to the Atlantic seaboard.

The data on file include maps furnished by 1,252 individual companies and twenty-eight maps covering a State or group of counties received from State or traffic associations, the whole embracing lines of about 1,350 toll line companies.

General Statistics.

Besides working on our maps we have been constantly adding to our other data and now have a comprehensive list of rate sheets showing the situation before and after the introduction of competition in representative towns, including all of the larger places, also letters from city and state officials, business firms and representative men at various places, endorsing competition, and a great deal of other information of a statistical nature for various states and the country as a whole.

This information, particularly the rate sheets and letters, has been in great demand by the Independent interests who were seeking new franchises in various parts of the country, including such important places as Providence, Boston, Milwaukee, Hartford, Omaha, Denver, Nashville and other Southern cities; and we have been informed by many receiving this information that it has been of invaluable assistance to them in preparing booklets, newspaper advertisements, briefs, etc., in order to properly present their case. It is remarkable how little is really known regarding the Independent movement by otherwise well informed people.

At Hartford, Conn., the figures presented by the Independents were questioned in open court by their competitor, but the association had no difficulty in securing ample proof in the shape of affidavits, copies of old bills and vouchers, etc.

A nominal charge necessary to cover the cost is made for all work of this nature and for furnishing data previously referred to, and in no instance is assistance of this kind given to any but bona fide Independent people. If unknown to the association officers, those seeking such help must first present satisfactory evidence that they are entitled to the assistance requested.

In securing the information of various classes as above outlined, it has been necessary, of course, to call upon Independent companies in various parts of the country, and with scarcely an exception this information has been furnished with commendable promptness. The association thanks all who have rendered assistance in this matter.

Publicity.

During the past year the monthly bulletins inaugurated after

From the Editor's Viewpoint

ADVANCES IN SMALL SWITCHBOARD BUILDING.

WHILE so much attention is being given to standardization, those connected with small telephone companies who are interested in the subject must derive considerable satisfaction from noting the progress which has been made of late years in the design and construction of small switchboards. It is doubtful if in any other class of telephone apparatus the advantages of competition among manufacturers have been more clearly manifested. Formerly, as is well known, provision was made in a certain way to meet the peculiar requirements of service at these boards, which at frequent intervals were likely to be handled by inexperienced operators, and in which troubles could only occasionally receive the attention of a skilled repair man. The precautions referred to consisted in making the parts of extra strength, and this in turn was accomplished by making the apparatus in such proportions as to secure what would now be considered extremely great size and weight.

It took some time to demonstrate that this was not exactly what was needed. If both jacks and plugs were, for example, made heavy in the same proportion, the plug was likely to be pushed into place with a correspondingly powerful effort on the part of the operator, and there was no reduction in the relative amount of wear. If, as was often the case, a plug of about the size of a railway coupling pin was connected to a light and flimsy cord, upon which was hung a heavy and cumbersome weight, the opportunities for trouble might, in the light of present knowledge, be as readily imagined as described.

At present the size of boards has been greatly reduced as compared with early models, with corresponding advantages, not only from the maintenance viewpoint, but also by permitting a reduction in the amount of space occupied by equipment, reducing the necessary reach for operators, and, finally, adding to the neatness of the appearance of the entire board.

Improvements seem to have been consistently applied, not merely to the parts of the board most essential to its operation, but to all portions liable to deterioration, so that a uniformly higher grade of product is obtained. For example, methods of making supporting devices for the apparatus, plug seats, fasteners and other minor fixtures have been improved repeatedly, so that not only has their cost been reduced by the invention of more economical shop processes, but those in use to-day are far better adapted to serve their several purposes than the corresponding fixtures which are found on the older boards.

As a piece of cabinet work, no less than as an electrical or mechanical device, the modern small switchboard has been made the object of careful study, and the result is evident in the more symmetrical design, neater paneling, and in firmer joining of wooden parts. Any ordinary accident in shipment, for example, is extremely unlikely to inflict a more serious injury than a slight marring of surfaces.

It has been recognized that the maintenance costs, slight as they may be on apparatus of this type, depend to a considerable extent, not only on the design and construction of the manufactured parts, but on their arrangement as well. The modern idea is to have all wiring so placed that the terminals of different circuits may always be found instantly by reference to a standard blue print. When this has been accomplished the result is to make the installation and testing very easy. The boards may be kept in good condition by a man who has hardly committed a circuit to memory. When this state of affairs is compared with that recalled by some of the "old timers," who felt called upon to memorize not only the circuits but the location of hundreds of individual wires, if they handled any considerable number of such boards, the real value of the improvements in design becomes evident.

The modern small switchboard appears so simple, and is arranged in such an orderly fashion, that the casual observer hardly appreciates that it is made up of a considerable number of parts, and that each one of these and the assembly has been for years the object of study and experiment by skilled engineers and mechanics. Nevertheless, this simplicity has been reached only after persevering and well directed efforts, and the operating man who reaps the benefit in increased freedom from the cares which beset him in earlier years does well to occasionally think of what he owes to the efforts of the manufacturing engineers.

THE RIGHT SORT OF PUBLICITY.

ATTENTION was called by President Hoge in his address at the convention to a very important feature connected with the publishing of news relating to telephone companies. His statement was to the effect that frequently newspapers which have investigated items relating to the telephone industry which have been furnished them, and which they have published with perfectly honest intentions, have afterward found that they had been used as tools for the spreading of misinformation. The only course of action open to them was to publish the other side of the case "to square themselves with their readers," and thus put themselves in a rather unfortunate position. Naturally they hesitate from that time on to publish anything further for the same interests which furnished the incorrect news. Mr. Hoge wisely warned the Independents against the slightest over-statement of their case before the public, as their competitor is likely to be watching for such an opening. Should incorrect news be published, and then have its falsity exposed, the recoil in public opinion usually sets the company to whom it relates farther back than the position from which it started.

Coupled with the policy of carefully supervising whatever information is given out to the press should, however, be an alert and aggressive watchfulness to see that people do not miss any of the good things that the telephone company is doing. The public is usually very well able to find out faults in the company's service, and to a lesser degree in its plant and financial arrangements, but the good points need to be called to their attention, and no opportunity for doing so should be lost.

Particular attention should be given to informing the public of all improvements to the system, of the extensions of service or means of providing a more uniformly efficient service. The public should be convinced that dividends are not the sole reason for the operation of the company. Every improvement that can be of any benefit to subscribers should be called to their attention and the idea instilled in their minds that the company's management is always on the watch for any feature that will tend to increase the value of the service.

HOW TO PARALYZE A TELEPHONE LINE.

WITHOUT long experience in telephone affairs a person who refers to things which affect a system is likely to use language which is decidedly amusing to the initiated. A correspondent has recently written to us that "A woman residing in Blue River township, near Greenfield, Ind., was the innocent cause of paralyzing a telephone line running from Greenfield to Westland in Hancock county."

It seems that she brought about this terrible injury with a no more extraordinary instrument than a common spoon. When called to the telephone she happened to have a teaspoon in her hand, and becoming interested in the conversation, which was presumably a long one, she placed the spoon on the top of the telephone box. When through talking she returned to her work and forgot the spoon, which by some jar was knocked against the two binding posts, short-circuiting the line, and consequently putting all telephones on it out of commission. Incidentally, the humor of the report was heightened by the statement that "It required two days for an expert troubleman to discover the cause of the trouble."

Legal Snares Untangled

CONDUCTED BY A. H. McMILLAN.

COMPANY'S RIGHT TO REQUIRE SAFE CROSSING OF WIRES WHEN CITY DOES NOT.

Will you please answer the following in your valuable paper, in the department of "The Telephone in the Courts"? We have an opposing company starting in our town. Its franchise states that when its wires cross ours, the bottom arms must be five feet above our top one, which is not the case. The town council refuses to demand a change, saying that if they are satisfied we must be. The wires of which I speak are bunched among ours, and should we ever string wires at this crossing again we would be obliged to go above their wires.

Can we compel the company to obey the franchise if the town council does not?

The company is incorporated in our state, but holds no franchise except a city franchise. O. K. H.

THE fact that the town council refuses to require your competitor to comply with the franchise in the location of its wires at points where they cross your wires does not deprive you of your right to demand a change. The franchise is a law which must be obeyed by both companies, and is enacted not for the protection of the city authorities, but for the protection of the companies themselves. Therefore it is your right to insist that the law shall be obeyed. Your remedy would probably be an injunction obtained in a court of equity to restrain the competing company from stringing its wires at points of crossing in an unlawful manner. Louisville Home Tel. Co. vs. Cumberland Telegraph & Telephone Co., 111 Fed., 663.

INJURY TO THE TROUBLE MAN.

Will you advise me as to the law in Illinois in the following case: A trouble man working for a company had a case of trouble, where a permanent signal showed in the office and in putting his test set on the line he found that it was crossed with an electric light wire, but could not get away from it and was made unconscious. He fell about 40 feet, and was injured by a broken limb and will be crippled for life.

Is the company responsible for all bills and what about further employment? H. L.

THE company is not responsible for his injuries unless it is to blame for the crossing of the electric light wire and the telephone wire. From your statement of the case, it does not appear that the telephone company was at all responsible for damages. Even if the telephone company was to blame for the crossing of the telephone and electric light wire, we do not believe it would be liable in damages to the trouble man, because, from the nature of his employment, he assumed the risks of such accidents as caused his injuries. The company would therefore not be responsible for his bills nor obliged to give him further employment.

ENFORCING JOINT USE OF TELEPHONE POLES.

AT Mobile, Ala., the city is endeavoring to force the Southern Bell Telephone Company and the Home Telephone Company to comply with an ordinance requiring the joint use of telephone poles. The ordinance requires the company owning the poles to rent them to the other company at the rate of fifty cents per year per cross arm. The Board of Public Works prior to February 7th made an order requiring the Bell Company to allow the Home Company to string its wires on the Bell poles on Claiborne street. The Bell Company gave the Home Company notice not to trespass upon its property. The board then made an order allowing the Home Company to set four poles on the street, and where the poles were set alongside of the Bell Company's poles, the board required the latter company to take its wires from its own poles and to string its wires on the Home Company's poles within thirty days. The thirty days' time expired March 10th, and as the Bell Company had not acted, the city electrician, under orders from the Mayor, with the assistance of several men in the employ of the city, cut down the four poles of the Bell Company. The Bell Company then applied for an injunction restraining the City of Mobile and its officials from interfering with the poles, wires and apparatus of the company.

The position of the city is that the right or franchise to use the streets, alleys and public places for putting wires and poles thereon for telephonic connections, granted to the Southern Bell Telephone and Telegraph Company, by an ordinance approved Dec. 13, 1889, is void, because the city at that time had no power in its charter to grant a franchise to use the streets for any purpose.

The city also claims that the ordinance of June 24, 1901, under which the Southern Bell Telephone and Telegraph Company claims the right to place wires and poles on and under the streets of Mobile, is also void, because the telephone company did not comply with Section 23 of the charter of the City of Mobile, approved March 5, 1901, which requires all applications for a franchise to be advertised and the city paid a certain percentage of the gross receipts for the use of the franchise, or a lump sum annually, and therefore the occupation of the streets by the telephone company with poles and wires is without the authority of law, and hence a public nuisance.

The company contends that the ordinances are contracts, and moreover, that the state law which provides that telephone and telegraph companies may set their poles and wires on the "margin of public highways," authorizes the telephone company to erect them on the streets of the city. The city, on the other hand, contends that the phrase "margin of public highways" refers to country roads and not to city streets.

INCOMPLETE ADVERTISEMENT CAUSES SUIT FOR DAMAGES.

AT Hopkinsville, Ky., five suits for $500 each have been started against the Cumberland Telegraph & Telephone Company charging that it had failed to have the word "incorporated" appear in advertisements which were published in a local newspaper. In the advertisement complained of, the word "incorporated" was not spelled out, but the abbreviation "inc." appeared. The suits were begun by the county attorney under a recent ruling of the Court of Appeals that the abbreviation did not fulfill the law.

WHEN POLE CUTTING IN PRIVATE ALLEY IS JUSTIFIED.

AT Baltimore, Md., a verdict has been rendered in favor of Samuel Ruth, who was sued for $1,000 damages by the Maryland Telephone Company for cutting down one of its poles. The decision was made by Judge Stockbridge without a jury. His ruling was that, under certain circumstances, the telephone company is not entitled to recover for the destruction of its poles.

"The Court rules, as a matter of law," Judge Stockbridge stated in his ruling in the case, "if the alley in the rear of the premises of the defendant (Mr. Ruth) was a private alley, laid out for the benefit of the property of the defendant, and other property abutting thereon, and the plaintiff (the telephone company) without a permit, and without permission from anyone possessing authority to grant such permission, placed in the alley, and upon that portion of it abutting upon the lot of the defendant, a pole, and the erection of the pole interfered with or tended to interfere with the necessary, reasonable and proper use of the alley by the defendant for the purposes for which the alley was laid out; and if the defendant gave the plaintiff notice to remove the pole, and after the lapse of a reasonable time after such notice had been given the pole was not removed, and then the defendant proceeded to remove the pole by cutting it down, then and in that event the plaintiff is not entitled to recover."

Flat Rates vs. Measured Service*

CONCLUSIONS EMBODIED IN THE REPORT OF THE SPECIAL COMMITTEE OF TELEPHONE EXPERTS APPOINTED BY THE CITY COUNCIL OF CHICAGO.

WE have pointed out earlier cogent reasons why the line of the average flat rate subscriber costs the telephone company, as a rule, more than the line of the average measured rate subscriber, largely on account of the overloading of the lines and the increase of the unavailing calls by the flat rate subscribers' use; and the foregoing study of the load curves indicates further that the way in which the calls become distributed in the system makes it possible for the telephone company to arrange its operating force more economically to take care of its present measured rate service, and therefore actually enables the telephone company to make the cost of operating less per individual call of the measured rate service than it can for the flat rate service.

On the flat rate basis the telephone subscriber who makes calls over his telephone line twenty or more times per day (perhaps even fifty or one hundred or more times) pays the same price as the subscriber who uses his telephone only eight or ten times a day, and the flat rate being an average rate which enables the telephone company to come out at the end of the year with its expenses all paid and a balance to pay interest on its investment, it is obvious that the small user pays more for his telephone than his use makes necessary and the largest user pays less for his telephone than his service probably costs the operating company. This is so manifestly unfair that there can be no justification in maintaining a strictly flat rate telephone charge in large cities, with the present known methods of operating. Such charges for telephone service are as unjust as similar charges would be if made for electric light or gas. It will be recognized as absurd to suggest that a gas company should charge a fixed rate per year for each gas burner in a place of business, regardless of the number of hours that the place of business is open. The differences between the amount of gas used per burner in a store that closes at 5:30 p. m. and in a saloon which closes at midnight, or between an office which is on an upper floor of some well-appointed and well-lighted office building and a shipping room which is in the basement of the same building, are so great that it is manifest that this flat rate method of charging would exercise the utmost injustice between customers—affording a long hour user a large amount of gas at a price which might not pay the company for the expense of the manufacture thereof, while the short hour user, paying the same price per burner, would be paying an extremely excessive price per cubic foot for the gas in order that the losses entailed by the long hour user should be recouped to the company. This method of charging was in vogue by electric light companies in the earlier days of electric lighting, before electric meters were reasonably perfected. It was then usual to charge business houses a fixed rate per incandescent lamp installed and connected to the lines, and residences a different and smaller rate per incandescent lamp installed, the assumption being that the residence would use the lights for fewer hours per day. This method of charging brought many electric light companies to the verge of bankruptcy, and as long as it was in vogue electric lighting remained a luxury. With the advent of charges for actual consumption (that is, measured rates) electric light came within the reach of the greater proportion of people who now use it, and the expansion of the electric lighting service was brought to a reasonable mark.

The meter question is one which creates some difficulty in the telephone field. Nickel prepayment telephone boxes provide for a large number of users. There are now in use in Chicago over 68,000 nickel prepayment telephones, and the number is apparently steadily increasing. In New York city the measured rate lines are individually equipped with meters in the exchange offices, and the Chicago Telephone Company has developed a meter which makes it impossible to register more than a single unit for each message over the line. We believe that this meter used in connection with the measured service lines that are not equipped with prepayment boxes will prove accurate and satisfactory, in case the City Council grants the Chicago Telephone Company a franchise. This meter is arranged in such a manner that no record can be made until the connection with the subscriber's line has been set up in the manner required for making a communication. Thereupon the operator by pushing a button may cause the meter to register one unit, and however many times the button may be pushed thereafter, through oversight or malice of the operator, no additional messages will register on the meter until the connection has been taken down after the completion of the message and a new connection has been made, as upon receiving another call from the subscriber. This guards against an excess number of calls being registered against any subscriber through oversight on the part of the operator. We see no reason why this meter arrangement should not prove commercially accurate and satisfactory, and we recommend its adoption for the instances of metered lines in case the Chicago Telephone Company should be granted a franchise.

We have allotted a great deal of time to the study of this question of rates and are convinced that *the general use of measured rates results in improvement in the service by the reduction of unavailing calls and also results in the reduction of the average cost to the consumers through the elimination of useless calls from the various stations, and makes it possible to place the lowest rate for the least expensive service within the means of the largest possible number of people.* We are also convinced that *the general adoption of measured rate service will bring about a more uniform rate of calling during the day, which will make it possible to ultimately reduce the price per message,* thus bringing about a further reduction in the average cost of telephone service and especially a reduction to the large class of users which subscribe for telephones of the lowest cost.

A partial application of flat rates is practicable in connection with business telephones which have sufficient service to make it worth while to set aside a special line or lines for outgoing calls only, since such lines do not interfere with the convenience of others, and do not cause a piling up of unavailing calls, because their busy state in no wise affects calls coming from other lines. Such flat rate outgoing service lines must in each instance be accompanied by a sufficient number of incoming lines, to be furnished at a relatively small rental. A partial application of flat rate service may also be applied in connection with residence telephones and with neighborhood exchange telephones, and is here justified because the restricted character or restricted circle of use makes the average calling rate per telephone relatively small and approximately equal for all users of the same class. In connection with residences this use of flat rates in a large city has some serious disadvantages, but its advantages probably overcome the disadvantages.

*Concluded from issue of June 1st.

O. F. FRENCH TO BUILD CANADIAN TELEPHONE SYSTEMS.

O. F. FRENCH, former general manager of the Cuyahoga Telephone Co., of Cleveland, and more recently managing engineer of the National Engineering Co., of Baltimore, has been appointed deputy minister of railways, telephones and telegraphs for the Province of Manitoba.

Mr. French will direct the work of building municipal and government owned telephone systems. He assumed his new duties May 21st, at Winnipeg, which is the capital of the province.

CLIMAX OF GOOD FEELING AT THE BANQUET.

(*Continued from page 374.*)

the condition in Tennessee. Independent telephony is no longer suppliant in Tennessee, for the people ask Independent men to come into the state to build systems for their relief.

T. Harvey Ferris, of Utica, responding to the toast, "The Empire State," hit several nails on the head and awoke his listeners to a high state of enthusiasm. Said Mr. Ferris: "The Empire State brings two messages to this meeting. First, as there is nothing in the Independent business which will warrant continual watering of stock, the Independents must be honest with the public to succeed. Aim only to pay legitimate dividends on actual capitalization. If at the beginning a company is earning 50 per cent reduce rates; should dividends dwindle to 5 per cent through expansion of the system, the public will not ask that the plant be operated on such a basis, but will permit an increase." Mr. Ferris's second message was: "Plan standardization of equipment, accounting, and methods of operation." Mr Ferris insisted that of all things necessary to the success of Independent telephony he could think of no influence for development greater than local interest in each company and local control. It has been proven that under a concentration of control in the management the success is far less.

"The Telephone in Modern Life" was responded to by Helm Bruce, of Louisville, Ky., in a happy manner . Mr. Bruce, an attorney prominent in the Independent movement, entertained the guests with many amusing and serious stories, pointing out almost miraculous features of telephonic communication. He said that of all things wonderful the telephone is the most marvelous achievement of human ingenuity.

H. D. Critchfield, of Milwaukee, was expected to speak on the topic "After a While." A telegram from him, however, expressed his regret, that owing to the strenuousness of the Milwaukee fight he was unavoidably detained. Mr. A. A. Goddard, of Topeka, Kan., detailed as a substitute, proved to be a good one. Mr. Goddard entertained the delegates by a most delightful impromptu talk. The banquet finally closed with "Auld Lang Syne," sung by the assembled delegates, led by the Weber quartet.

Final Papers and Election

THE final session of the convention opened Thursday morning with the paper "Toll Line Clearing Houses," by J. M. Plaister, Ft. Dodge, Iowa. This paper was splendid in every detail. During its reading Mr. Plaister urged the discontinuing of the issue of coupons at discount as a practice unfair and detrimental to the business.

The report of the Committee on Physical Standards was submitted by E. E. Clemen..

C. S. Norton conducted the question box and many questions of importance were responded to and discussed. A question which brought forth animated discussion was "What is the best illustration to impress upon the public the fact that the cost of operating per station increases with the increase in the number of subscribers?"

Mr. W. Gilbert Thompson answered this question, saying that in his opinion the best way was to keep accurate account of comparative costs and take the public into the company's confidence. He would take a committee of representative citizens and bright business men through his exchange and let its members see how many calls a day come into the operating room. Let them first be taken into a small exchange, then visit a larger exchange, and in this way see for themselves the difference in the amount of labor and equipment per line.

Mr. Woodbury reported for the finance committee. Mr. Têtu moved that the members of the finance committee receive the thanks of the convention for their able work in raising funds to carry on the important work of the association. Approval of this was signified by a rising vote.

Mr. Davis reported for the Committee on Incorporation. Mr. Boylan and Mr. Scott followed this report with answers to the question concerning the increase in cost of operating an exchange as the subscribers increase. Another interesting question referred to the Committee on Litigation and Legislation was, "What is the best protection against wire thieves—could the association successfully take hold of the matter?" The question, "Is there not some way in which the use of the shield can be protected," was referred to the committee on legislation.

After the close of the "question box" the assistant secretary read the paper, "Telephone Securities as an Investment," by W. L. Moellering, Ft. Wayne, Indiana. This was followed by an interesting paper, "How to Handle Long Distance Telephone Business," by Frank Hart, Pittsburg.

"Making History in the Canadian Northwest," by Frances Dagger, told in an exceptionally interesting manner of the recent successful conflict with the monopoly in Canada.

"Post Office Telephones and the Washington Situation" was

W. Gilbert Thompson, One of the Leaders from Ohio.

E. B. Fisher, Michigan, Elected Fourth Vice-President.

C. E. Wilson, Gen'l Manager Keystone Telephone Company, of Philadelphia.

C. H. Judson, Now Engineer of the Independent Telephone Company, Seattle.

Digitized by Google

discussed by Charles E. Sumner, Oregon. Mr. Sumner said that at its next session Congress would be asked for a franchise whereby Independent telephones may be installed in the capital city of the United States. He pointed out that the growing sentiment against monopoly would cause the people to support the Independent demand for a square deal. He advised that a committee be appointed by Congress to give the association a fair hearing. Independent telephony needs recognition in the capital of the nation more than in any other city. He urged members to exert persistent efforts along all proper lines of political activity. He closed amid great enthusiasm by saying that at the next meeting Congress will grant a franchise for the establishment of Independent lines in Washington, D. C.

C. W. Kline, Pennsylvania, offered two resolutions which were adopted by convention as follows:

WHEREAS, The Independent Telephone Company of Rhode Island has petitioned the city council of Providence for permission to install an Independent system in that city; now therefore, be it

Resolved, That we in convention assembled, representing four million Independent subscribers, hereby request that honorable body to grant this petition to the end that these four million subscribers may not be disbarred from direct communication with the representatives of the industries of that great city, and be it further

Resolved, That a copy of these resolutions be forwarded to the mayor and city council of Providence.

WHEREAS, The delegates and visitors to this annual convention have been royally entertained by the committees and the management of the Auditorium Hotel, and

WHEREAS, The membership of this convention appreciates the kind efforts made on their behalf at this banner convention; therefore, be it

Resolved, That we extend to the various committees and to the hotel our hearty thanks for their kindness; and be it further

Resolved, That we extend the thanks of this convention to the manufacturers and supply men for their fine exhibits and for the material financial support which they have so liberally extended to the association; and be it further

Resolved, That this convention extends its hearty thanks to the Press Committee, Associated Press, the Scripps-McRea News Service, and the press of the country in general for their full and impartial reports of its proceedings.

Several letters of regret were read from absent members. Two letters of invitation were read, one from Atlantic City, inviting the convention to meet at that place next year, another from Mayor C. M. Becker, of Milwaukee, extending an invitation to the association to meet in that city next year; these were referred to the executive committee. The committee on nominations reported for election as officers for the coming year the following names:

President, Theodore Gary, Missouri; first vice-president, Frank L. Beam, Ohio; second vice-president, Charles E. Sumner, Oregon; third vice-president, E. B. Fisher, Michigan; fourth vice-president, A. L. Hoover, Canada; secretary, Charles West, Pennsylvania; treasurer, Manford Savage, Illinois.

This report was adopted. In acknowledgment, President Gary said in part: "It is needless to say that I highly appreciate the honor conferred upon me in my election as president of this association. I appreciate this honor more than I would being governor of any State in the Union. I wish to state that I shall carry out my motto, which I use in my business, 'render good service.' I will try to give a square deal; endeavor to serve the entire interests represented, not one section. I congratulate this convention on its great success; congratulate the association for the high class of its representatives, who are assembled here." Mr. Gary concluded with numerous other remarks, commending the organization.

The committee on constitution and by-laws reported several amendments made to the constitution. An amendment was moved and adopted to drop the words "of America" in the name of the association, so that it shall hereafter read "International Independent Telephone Association."

The meeting then adjourned, leaving the members with the memory of one of the most successful and inspiring gatherings which they have ever attended.

What the Manufacturers Showed

STANDARD UNDERGROUND CABLE CO. had an attractive exhibit in charge of J. R. Wiley, J. E. O'Neill, W. M. Rodgers, Chicago; E. J. Pietzcker, Richard Houck, St. Louis; A. A. Anderson, L. L. Parkinson, Pittsburg.

NUNGESSER ELECTRIC BATTERY CO., Cleveland, O., represented by H. G. Robbins, treasurer, Thos. G. Grier, Chicago, general sales manager, and H. S. Greene, of the Chicago office, exhibited the well known "1900" dry battery. The climax of all battery construction was its gigantic 1900 cell, about seven feet high, which had a door and was really a telephone booth in disguise.

AMERICAN SEWER PIPE CO., Pittsburg, was represented by W. R. Adams, sales manager. This company manufactures a high grade line of conduit, both single and multiple duct.

EUREKA ELECTRIC CO., Genoa, Ill., exhibited a 200 line visual signal magneto switchboard of a new type, a 50 line magneto board, having a new type drop and a full line of magneto and

G. R. Johnston, Manager of the Columbus Citizens' Telephone Co., Columbus, O.

H. D. Critchfield, a Leader in Wisconsin Telephone Development.

J. B. Rhodes, an Able Ohio Worker for the Independent Organization.

Digitized by Google

common battery telephones and parts. V. H. Messenger, secretary and treasurer of the company, was in charge, assisted by J. H. Bell, E. L. Larabee, F. H. Holroyd and A. H. Miller.

EVERSTICK ANCHOR CO., St. Louis, had a good display of Everstick anchors. Jasper Blackburn, president and general manager, attended the convention.

CENTURY TELEPHONE CONSTRUCTION CO., Buffalo, had an interesting exhibit of Century apparatus, the center of which was a new 200 line switchboard equipped for 20 trunk lines, just completed for Cornell University. The company was represented by W. W. Kidney, chief engineer; C. H. Macklin, sales manager; G. F. C. Bauer and W. O. Rhode.

UNITED BRASS MFG. CO., Cleveland, exhibited the Corcoran wipe joint machine. As its name signifies, this appliance does the work of the plumber in wiping cable joints and very effectually, it is said. The company was represented by W. J. Schoenburger, secretary, and Thomas B. Daley.

JULIUS ANDRAE & SONS CO., Milwaukee, had an interesting display. The most attractive feature was a 200 line magneto board with a Treco electric whistle connected to the night bell circuit. The company also showed new type inexpensive volt ammeters, its well-known iron box party line condensers, etc. F. H. Andrae, secretary; H. P. Andrae, treasurer and general manager; J. C. Schmidtbauer, vice president, and W. S. Pearne, advertising manager, attended.

THE WIRE AND TELEPHONE COMPANY OF AMERICA, Rome, N. Y., was represented by H. A. Hammond, manager of sales; F. M. Potter, Jr., and A. J. Kennedy. The company exhibited Easophones, a combination telephone which is said to be rapidly growing in popularity.

FRANK B. COOK, manufacturer of protective devices, was represented by Mr. Cook, H. Roy Cook, J. F. Thompkins, F. R. Parker, F. A. Rader, E. E. Dewey, S. C. Harvey and J. M. Moore. The exhibit consisted of central station, cable and substation protective devices, the newest of which is the No. 10 graphite automatic resetting heat coil, and a new porcelain cable terminal. There was also a display of miscellaneous telephone specialties, Cook's self-welding wire joint, guy clamps, etc.

MCROY CLAY WORKS, Brazil, Ind., was represented by "Kirk" Kirkpatrick, sales manager, who showed a full line of underground conduit and a motto: "Your cable is as safe in McRoy conduit as your money in government bonds."

AUTOMATIC ELECTRIC CO., Chicago, exhibited a 100 line unit of a common battery automatic switchboard, with twelve telephones connected. There was shown also a combination wire chief's and trouble clerk's desk, just completed for the Home Telephone Company, of Champaign and Urbana, Ill. A duplicate set, four frequency harmonic converter, built for the Montana Independent Telephone Company's automatic exchange, at Butte, Mont., was also shown. The company was represented by C. L. Fisher, sales manager; F. L. Middleton, assistant sales manager; H. H. Woodworth, advertising manager, J. A. Russell, R. J. Eubanks and J. E. Fisher, of the sales department, and Wm. Harman and J. S. Engle, of the engineering department.

LOUD SPEAKING TELEPHONE.—One of the most interesting features at the convention in the line of exhibits was the loud speaking telephone, manufactured by the INTERNATIONAL TELEPHONE MFG. CO., Chicago. It will transmit speech to a large audience. The sending station was placed in the company's headquarters and receivers with megaphones were placed in various locations of the hotel waiting rooms and rotunda. Vocal solos and whistling entertainments were transmitted through the instrument and heard throughout the hotel. The International Company's exhibit also contained a full line of telephone apparatus for large and small public exchanges. The International Telephone Mfg. Company's representatives present were Henry Shafer, president; John C. Burmeister, secretary and treasurer; F. E. Freers, manager; B. Carlin, superintendent; T. Crozier, H. M. Coulter, F. Shaw and J. Hoffenkemp.

L. M. ERICSSON TELEPHONE MFG. CO., Buffalo, had a display in charge of J. R. Powers, Des Moines, Ia.; H. B. Hewitt, Chillicothe, Mo., and J. H. Montague, manager of sales, Buffalo, N. Y. A feature of the display was the rural line equipment for ground lines equipped for pulsating current. With this equipment the rural ground lines will throw the drop at central when only central is wanted and when they ring on each telephone the operator is not disturbed. In this exhibit there were also a new four party harmonic system, sundry telephone parts, new lineman's test set, switchboard parts and a general display of accessories. The company gave a demonstration of its generators ringing 100 bells simultaneously.

UNIVERSAL POLE AND POST PRESERVING CO., Circleville, O., had an exhibit showing its very interesting method for preserving poles. The exhibit was in charge of H. P. Folsom.

MILLER ANCHOR CO., Norwalk, O., has a new one in the form of a mechanical expanding auger for enlarging holes which attracted considerable attention. The exhibit was in charge of G. H. Miller, president, and F. B. Miller, vice president.

HOMER ROBERTS TELEPHONE CO., Chicago, showed its secret service and lock-out system. This party line system gives the limited user practically the same exclusive service as if he were served by an individual line. The display was in charge of A. F. Rosenberger.

INDIANA STEEL AND WIRE CO., Muncie, Ind., was represented by E. F. Kitselman, secretary and manager, and Robert Miller, manager.

A feature of the exhibit of the VOTE-BERGER CO., LaCrosse, Wis., was a 3,200 line C. B. iron wire ballast switchboard, magneto and central energy telephones and magneto switchboards. The company also made a display of framed blue prints of its circuits and D. and T. anchors. During the convention a demonstration of a pendant telephone was carried on. In charge of the exhibit were C. D. Enochs, engineer; J. F. Peiffer, engineer; M. I. Berger, secretary and treasurer.

Attending to the wants of the visitors and explaining the features of the exhibit of the CENTRAL TELEPHONE AND ELECTRIC CO., St. Louis, Mo., were James S. Cuming, president; Charles H. Wallis, vice president, and L. G. LeBourveau, sales manager. Its specialties are the Arrow cable trolley, Becker pressed steel terminals, Ajax dry battery and a special line of inside and outside protectors.

AMERICAN STEEL AND WIRE CO., Chicago, cordially received its guests, those doing the honors being Burley Ayres, Frank Conklin, Illinois representative; C. S. Knight, Western manager, and G. W. Quigley, of Kansas City.

Many visitors to the convention stopped at the exhibit of the CHICAGO TELEPHONE SUPPLY CO. On exhibition was a large and splendid line of sample supplies. Greeting the visitors were George A. Briggs, president; G. W. Brown, secretary and treasurer; J. Edwin Myers, Dayton, O.; D. F. Roseborough and F. P. McIntosh.

W. G. NAGEL ELECTRIC CO., Toledo, O., showed a splendid display of "Ready" pay-out reels, Hercules malleable iron anchors, Robinson distribution racks and "Swisher" cable hangers. Harry E. Adams was in charge.

UNITED STATES COIN REGISTER CO., Toledo, O., with Gary S. Powell in charge, displayed its registering pay station.

PRESIDENT E. B. OVERSHINER, of the Swedish-American Telephone Company of Chicago, was in charge of the company's exhibit and entertained many visitors and delegates. The display attracted a great amount of attention. A. V. Overshiner and Stanley A. Duvall assisted the president.

STROMBERG-CARLSON TELEPHONE MANUFACTURING CO., Rochester, N. Y., was represented by A. M. Haubrich, Chicago manager; William Bowen, J. J. Nate, Paul D. Myers, E. P. Shafer, H. A. Jones, Charles F. Speed, H. C. Slemin, advertising manager; J. P. Cracraft, sales manager; O. M. Leich, asst. chief engineer, and A. O. Stigberg. The exhibit consisted of a full line of telephone equipment and on display were a switchboard equipped with harmonic ringing attachment, generator call telephones and samples of dry core and wool cables. At the company's office a complete central energy multiple switchboard was in operation.

ROCK ISLAND BATTERY CO., Cincinnati, displayed its new pat-

Digitized by Google

ent dry cells which attracted much attention. In charge were Myer A. Loeb, general manager, and Charles Wilson.

DURANT ELECTRIC SUPPLY Co., Chicago, had a neat exhibit with H. S. Durant, F. W. Pardee and James Crook looking after the welfare of visitors.

SELECT TELEPHONE MFG. Co., with a demonstration of its lock-out system, attracted many visitors. In charge were C. E. Juvenal and William Bruce, Jr.

Superintending the display of the NORTH ELECTRIC Co., of Cleveland, O., were C. H. North, president; J. F. Engle, Raymond Hendrickson, George B. Pratt, C. D. Boyd, A. A. Miller and A. A. Marrs. The exhibit was complete in every detail.

WESTERN TELEPHONE MFG. Co., Chicago, showed two types of instruments, the Economist and Ideal. The Economist is designed especially for rural lines and the Ideal is of the central energy type for magneto exchanges. The company also manufactures all regulation types of central energy switchboards. In charge of the exhibit were C. O. Johnson, treasurer; E. A. Anderson, acting manager; Eugene L. Brown, sales manager; G. W. Peacock, engineer.

AMERICAN ELECTRIC FUSE Co., Muskegon, Mich., exhibited a complete line of protective apparatus and the display was well arranged. F. G. Jones, J. A. Kenny and G. W. Rodormer were in charge.

S. B. CONDIT, JR., & Co., Boston, manufacturers of the Condit marlin cable hangers had a neat exhibit in charge of P. R. Fisher.

CLAUDE L. MATTHEWS, assisted by O. R. Johnson, represented the firm of W. N. Matthews & Bro., St. Louis. In this exhibit a practical demonstration of the Hargis cable splicing joint was made. A number of the Stombaugh guy anchors were seen and a test of a waterproof cable spliced joint in a fish tank filled with water.

THE CHANCE MFG. Co., Centralia, Mo., showed the new Sky-Rocket lightning arrester, with A. B. Chance in charge of the demonstration. The Sky-Rocket is made for any size and kind of wire.

A full line of harmonic bells and a splendid display of all improved telephone appliances were shown by the LONG DISTANCE TELEPHONE MFG. Co., South Bend, Ind. R. E. Willard was in charge.

The Columbia dry cell was exhibited by NATIONAL CARBON Co., Cleveland, O. Those who entertained visitors were E. J. Kenny, A. B. Ward, Wallace O'Connor and M. H. Moffett.

On display at the headquarters of the ELECTRIC APPLIANCE Co., Chicago, were testing instruments and a complete line of telephone material and supplies. Robert Mitten, manager of the telephone department, was in charge. A handsome souvenir in the form of a watch fob, with the shield in colors, was given all visitors. Mr. Mitten was assisted by M. J. Blakemore. M. L. Scobey, of Nebraska, was present.

From Wheeling, W. Va., was the MOUNTAIN STATE ELECTRIC Co., with an exhibit of the Poole lock-out system and Hall's special fuses and cable terminals and a special line of hardware. A. F. Poole and J. F. Frasher superintended the exhibit.

A complete line of magneto and central energy switchboards and central energy appliances was shown by the MONARCH TELEPHONE MFG. Co. The exhibit was very complete and up to date. In charge of the display were E. E. Yaxley, treasurer; J. C. Hubacher, vice president; W. H. Trimm, secretary; T. L. Dunlap, A. J. Carter and R. C. Stone.

AMERICAN ELECTRIC TELEPHONE Co., Chicago, exhibited the Leich four party system and the Zabel eight party system, also a full line of magneto and central energy apparatus. The principal feature of the display was the round bar magneto generator, also new central energy apparatus, similar to that installed recently in the new switchboards furnished by the company at Camden, N. J.; York, Pa.; Topeka, Kas., and Auburn, Neb.

P. C. Burns, president, and J. G. Ihmsen, general manager, devoted most of their time to the duties involved by the convention committees. Those looking after the comfort of the visitors were: Max W. Zabel, sales manager; A. B. Ferdinand, C. J. Larson, W. J. Stanton, John S. Stratton, Ira Butterfield and H. P. Blackledge.

THE CARNAHAN-SHERWOOD Co., Indianapolis, exhibited a fine line of account books for telephone companies. The concern was represented by H. E. North, C. N. Glover and R. H. Carnahan.

CRAWFORDSVILLE WIRE & NAIL Co., Crawfordsville, Ind.; the SCRANTON BUTTON COMPANY, Scranton, Pa., and the ACME RUBBER Co. occupied the same room on the first floor, where they had a splendid exhibit of their individual lines of appliances and materials. In charge were H. E. Cobb, manager and sales agent, and G. D. Wilson.

DEAN ELECTRIC Co., Elyria, Ohio, extended a welcome to all comers. The tired delegate was privileged to enter, make himself comfortable in a cosy chair and regale himself with a fragrant Havana. The company this year did not make a feature of an exhibit, but instead entertained its friends in a cordial, hospitable way. Those assisting with the entertainment were W. W. Dean, A. E. Barker, George A. Scoville, W. H. Scott, A. V. Smith, L. G. Bowman and E. M. Ford.

THE STERLING ELECTRIC Co., Lafayette, Ind., having previously arranged the reading room of the Auditorium, greeted its friends and displayed its hospitality in a way that will not soon be forgotten. The room was artistically decorated with flowers and ferns, and Steinbach's orchestra furnished music during the meeting from ten to twelve and from two to five each day. The Sterling Company had special souvenirs of the official program, which were distributed. Each visitor was also given a souvenir miniature telephone,. It has heretofore been the custom of the Sterling Company to make an exhibition of complete telephone apparatus, consisting of switchboards, telephones and protectors, and the radical departure in the display at this meeting was an attractive feature. It had a special exhibit on the fourth floor of telephones, switchboards, etc., which the visitors were invited to inspect. The Sterling Company was represented by W E. Doolittle, president; W. R. Coffroth, secretary; S. B. Fowler, electrical engineer; Evan Shelby, sales manager; H. T. Doolittle, purchasing agent; C. R. Brown, sales department, and O. P. Reed, sales engineer.

THE AMERICAN ELECTRICAL NOVELTY AND MANUFACTURING Co., New York City, showed its line of Ever Ready batteries and other specialties.

THE REPORT OF THE ASSISTANT SECRETARY.

(*Continued from page 377.*)

the 1905 convention were continued, copies of them being furnished to all of the Independent telephone journals and special bulletins covering the situation in New York State, which threatened to affect practically the whole country, were mailed to all of the Independent telephone companies in the United States and Canada, as well as to the executive officers of the various associations and to the press and journals. In addition to the foregoing, notices covering important subjects have been sent out whenever necessary to the executive officers of the state associations and leaders in various parts of the country, and on a number of occasions special articles presenting the Independent situation have been published in papers outside of the technical press, either as a matter of general information or in answer to misleading articles published by our competitor.

General.

At present there are Independent telephone associations in twenty states and Canada, and a number of new organizations pending; seventeen of the existing organizations, including Canada, have applied for membership in the International Association. A number of others are considering the matter and may present their applications at this convention. The International Association keeps in close touch with all of these organizations, whether members or not, and on matters of general interest all of them may be considered as affiliated with the International.

Independent Telephone Securities as an Investment*

By Wm. L. Moellering.

ANY enterprise launched under unbroken bright skies may reach a point where it becomes inviting to investors, but until it has successfully withstood the test of adverse conditions usually sure to come, its enduring ability to pay dividends and keep its principal unimpaired is a matter of conjecture.

Any industry handicapped in all directions at the start and subject to unscrupulous competition and which, notwithstanding, carries its business to a successful issue and a growth beyond expectations has earned the right to invite capital. This being true the investigating investor must view with favor securities issued by carefully conducted Independent telephone companies.

Passing through years of constant warfare directed against them by one of the former great monopolies—a competitor who had at its command unlimited capital, a press bureau, trained legal and electrical talent, etc., while the Independents had no experience, no long distance service, exceedingly limited manufacturing facilities, with capital suspicious, threatened and actual lawsuits, the Independents have met every condition and emphatically have won the long-fought battle. To-day they are equipped with the best electrical appliances, both in the manufacturing and operating branches, enjoy a large and rapidly increasing long distance service, legal battles are decided in their favor, the investor's confidence is gained and competition has largely ceased to be a disturbing factor.

Almost without exception wherever both companies occupy the same field the Independents outstrip the old monopoly. In character of service they excel in a marked degree, in growth they surpass tenfold, and financially they are able to pay dividends, meet obligations and create a safe surplus. Has it ever occurred to you what the record will be in ten years from now under the changed conditions? Has the investor compared the present market value of Independent securities, their rise during the recent years, with the present market quotations of the Bell, or its subsidiary companies' stock as compared to past years? It is eloquent of the situation.

Is it not true that the best criterion of the value of a security is the regard in which it is held among its home people who are in a position to best know its strength or weakness? Is it not a fact that home people are the largest and most constant buyers of Independent telephone stocks and bonds, in many instances absorbing the full issue? Witness Toledo, O.; Ft. Wayne, Ind.; Los Angeles, Calif.; Kansas City, Mo.; St. Louis, Mo.; South Bend, Ind., Grand Rapids, Mich.; Louisville, Ky.; Cleveland, O.; Muncie, Ind., and hundreds of the larger cities in all sections of the country, where home capital takes either all or the larger part of securities placed on the market by the local Independent companies.

If you happen to live in a community where capital is timid, try a tabulated statement showing in detail your earnings, expenses, growth, with all future possibilities, select a number of the larger telephone companies who have operated a number of years and give their experience, their rise in stock values, and let your statement contain a list of other home industries in comparison. You will be surprised at how many good industries in your midst fail to show as good results as do you.

The regular dividend ranging from 3% to 10% now being paid by most Independent companies, and the creating of a surplus fund after having made proper deductions for depreciations has made the investor take notice, and former prejudice fostered by the opposition has given way to impartial investigation with most encouraging results.

It must be patent to every observer that Independent telephone companies are more carefully and economically conducted than the Bell. Local men of broad business experience constitute their boards of directors and they are in constant close touch with the company's affairs. Another great element of strength consists in the sentiment of the local community which is as a rule outspokenly and actively favorable to Independent interests.

Viewed from the standpoint of failures Independent telephone securities are noticeably strong, the per cent. of failures as compared with other industries being strikingly small. There are in the United States over 7,000 Independent telephone companies with a capitalization of $350,000,000. Dun and Bradstreet weekly reports of bank, trust company and commercial failures very rarely include an Independent telephone company.

* Abstract from an address delivered at the International Convention, June 5, 1907.

MEMBERSHIP OF SPECIAL COMMITTEES AT THE CONVENTION.

Committee on Amendments to the Constitution.

Charles E. Sumner, chairman, Oregon; F. H. Woods, Nebraska; Theodore Gary, Missouri; M. B. Overly, Kentucky; Judge Smith, New York.

Committee on Credentials.

A. C. Lindemuth, chairman, Indiana; Alpheus Hoover, Canada; G. S. Shanklin, Kentucky; W. H. Nelson, Kansas; W. H. Bassett, Illinois; T. H. Ferris, New York; G. W. Thompson, Ohio; E. H. Pollock, Nebraska; F. D. Houck, Pennsylvania; J. B. Ware, Michigan; J. W. Barnes, West Virginia; E. H. Moulton, Minnesota; W. T. Wynne, North Carolina; F. H. Stow, California; Houck McHenry, Missouri.

Committe on Resolutions.

James S. Brailey, Jr., chairman, Ohio; C. W. Kline, Pennsylvania; S. S. Lichty, Iowa; W. J. Uhl, Indiana; W. B. Woodbury, Michigan; Manford Savage, Illinois; H. D. Critchfield, Wisconsin.

Nominating Committee.

D. E. Sapp, chairman, Ohio; O. C. Snider, Missouri; Charles West, Pennsylvania; Richard Valentine, Wisconsin; H. S. Baker, Iowa; E. L. Barber, Kentucky; M. L. Clawson, Indiana.

Auditing Committee.

Charles West, chairman, Pennsylvania; C. C. Deering, Iowa; C. S. Norton, Indiana.

BELL RATE-RAISING WIPES OUT TOWN SYSTEM IN TENNESSEE.

BY raising its rates on subscribers in Fredonia, Tenn., it is reported that the Cumberland Telephone & Telegraph Company recently lost all its subscribers but two. The rates have been high enough, the subscribers said, but the company announced that the rates would be raised on June 1. A mass meeting was called and a resolution adopted and sent to the company declaring that they would not patronize the company if the increase was insisted upon. The company did not reply to the communication and all the telephones but two were taken out last Saturday.

OBITUARY.

JUDGE J. E. BOYNTON, of Waco, Texas, died May 22, after a very short illness. His death will be seriously felt by all concerned in the Texas Independent telephone movement, as he was ever ready with most excellent advice in legal matters and held considerable stock in telephone companies. He was a director in the Brazos Valley Telephone Company, the Texas Telephone Company, the South Texas Telephone Company, and the Home Telephone Company of West.

Judge Boynton was a very able lawyer, having a high reputation throughout the entire state. He was always a gentleman even in the most trying circumstances, honorable in every sense of the word, and one whose friendship was valued very highly by all who knew him.

Your Question—Our Answer

CALL WIRE SYSTEM.—(871.)

Will you kindly inform me if there ever existed in this country a telephone system in which the subscribers' telephones were not supplied with a calling device such as a magneto generator or some such arrangement and how the system was operated. As I understand it, this was before the days of common battery and I do not get the idea as to the method adopted.

C. G. R., New York.

There were at one time several exchanges of this type in the United States, the first being in New York city, where it was introduced in 1878, and was operated on what was termed the "call wire" principle. This system was provided with "call" or "order" wires, one to each operator, which was connected with a group of instruments numbering from thirty to fifty, or as many as the operator could conveniently care for.

This call wire was altogether distinct from and in addition to the subscriber's ordinary lines, the operator's apparatus being in direct connection with it at all times. When a subscriber desired connection with another line he pressed a button on his instrument, thus cutting his telephone in circuit with the call wire, and without further ado told the operator the number of the line with which he desired connection, at the same time advising her of the number of his own line. The operator thereupon connected the two lines with a conducting cord having a plug at each end. In some cases the subscriber then signalled the person desired by means of a generator provided in his instrument; in others the operator was provided with means for calling.

Upon the completion of his conversation the subscriber again pressed his call button and informed the operator that the connection might be taken down.

CORDLESS SWITCHBOARD.—(872.)

We have several business houses in our city to whom we could sell private branch exchange service which would comprise about five or six telephones in each instance aside from the switchboard. Will you advise us how we may wire up a small board of the cordless type, that is, where keys are used instead of plugs and cords for connecting the different instruments?

We desire to use the cordless board for several reasons, the chief of which is that the patrons desire them, and then we figure that we will not be at a continual expense for the repairing of cords.

W. O. D., Iowa.

In Fig. 872*a* is shown a diagram of the wiring of a six drop cordless switchboard that will probably meet your requirements.

The lines are connected to the middle contacts of the ringing keys in the first row, while the drops, which are supplied with the

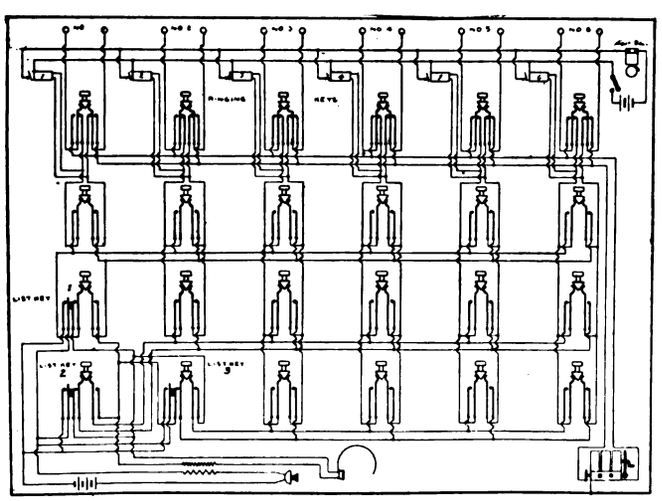

Fig. 872a.

night-bell circuit, are bridged across their inside contacts, and the generator is, as usual, across the outside contacts of these keys. The middle contacts of the ringing keys are each in their turn connected to the inside contacts of the keys in the first connecting row. The outside contacts of each key in this row are connected together as indicated. By closing any two keys in this line any two of the circuits may be cross-connected.

Bridged across the wires connecting the outside contacts of this connecting row is listening key No. 1, which is the first key in the third row. Connecting row No. 2 is wired in a similar manner

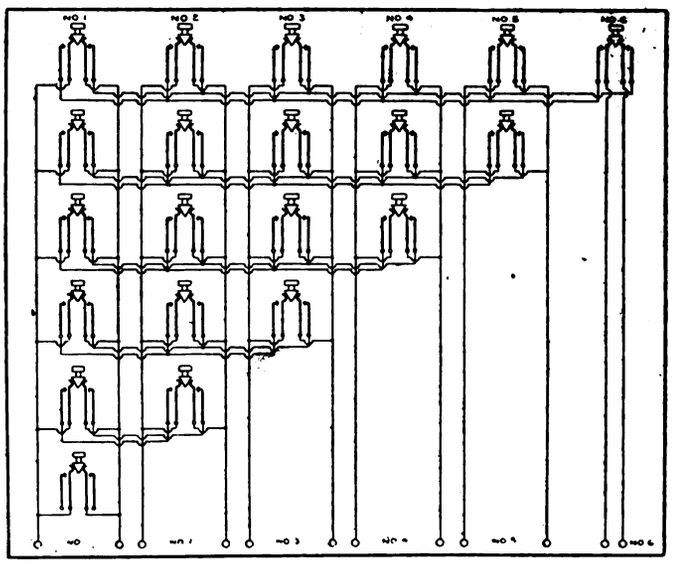

Fig. 872b.

except that there is no key for line No. 1. Its listening key is the first in the fourth row. Connecting row No. 3 omits keys for lines No. 1 and No. 2, and its listening key is the second one in this row. The receiver and transmitter with the battery and induction coil are bridged across three ringing keys in the manner shown.

To use the board, when a call comes in, turn down the key corresponding to the line in any one of the three connecting rows and then the listening key corresponding to this row. To make a call turn down the ringing key of the line asked for and then the proper connecting key in the same connecting row as that in which the first key is located.

Fig. 872*b* shows another method of wiring the connecting keys and is known as the triangular system.

PLAN OF ORGANIZATION.—(873.)

What general plan of organization is followed by the large telephone companies in relation to departments which have to do with outside work? Also kindly outline briefly the nature of the duties of the different departments.

H. R. R., Canada.

The organization plans of the majority of the large telephone companies comprise six different departments, which have to do with the operating affairs as follows:

The engineering department, whose business is to design the plant to be used and to supervise its construction; the construction department, which has to do with the building of the plant; the maintenance department, which keeps the plant in condition necessary for its proper operation; the supply department, which has to do with the feeding of the plant; the contract department, whose business is to see to the growth of the plant on a profitable basis; the right of way department, whose function is indicated in the title.

STANDARD FOR NUMBERING CROSSARM PINS.—(874.)

A SUBSCRIBER who has heard of several methods of numbering pins on cross-arms is anxious to know what managers throughout the country consider the best way. He calls attention to the fact that some say "number from left to right with back to office," while other say "from left to right when facing west or north." He would like to hear from different sections of the country to enable him to determine what is generally considered the best practice. The Editor will be glad to publish statements of practical experiences tending to show advantages of one method over the other.

From Here and There

LONDON TELEPHONE SERVICE BEING SEVERELY CRITICISED.

EUROPEAN telephone systems seem to be continually provoking the wrath of their subscribers, and the occasion in nearly every case is poor service. At the present time the people of London are the principal objectors, and are making many complaints of specific faults with the service. The most common of these are slow connections, false calls, obtaining of the wrong number, cut-offs occurring altogether too frequently and the inevitable complaint that lines are reported busy when nobody is talking on them. It seems to be very difficult to keep the standard of service up to a point which will at all compare with modern standards, and the difficulties in the large cities seem to be felt with especial severity.

A UNIQUE ADVERTISEMENT.

THE following demand appeared in the columns of the Pittsburgh *Leader* on April 29, 1907, which is probably unlike any advertisement that has ever appeared in the history of a telephone company:

Wanted.—3508 Fifth avenue, Pittsburg. The Bell Telephone Co. having removed my telephone, all persons desiring to communicate with me are requested to use the P. & A., No. 200 Park.
(Signed) M. W. EVERSON, M.D.

Its appearance is said to be due to the fact that Dr. Everson has had trouble with the Bell Telephone Co. In Pittsburg, subscribers are charged a certain sum for each call. The doctor asserted that in his bills of late he had been charged for a great many calls that he never made. He refused to pay some of the exorbitant bills and complained to the president, but alleges that the company's employees called at his house and in his absence removed the telephone. Dr. Everson has prepared to bring mandamus proceedings and a suit for damages against the corporation.

UNITED STATES FOREST SERVICE TO EXTEND ITS TELEPHONE LINES.

THE National forest reserves in Oregon, Idaho, New Mexico and Colorado are to have telephone lines constructed during the coming season under the direction of the United States Forest Service, according to recent reports from Washington. It is stated that in the Bitter Root Forest in Idaho the supervisor has been authorized to cooperate with the ranchmen to construct a line from Koohis to the forks of the Clearwater River, a distance of twenty-five miles. A twenty-four mile line is also planned to extend from Tin Cup to Dorchester, on the Gunnison reserves in Colorado.

Apparently the lines which have already been constructed have proved to be of sufficient value for the protection of the forests from fires, and assistance in the administration work, to make it well worth while to continue the movement.

PACIFIC COAST INDEPENDENT COMPANY PUBLISHES NEWS BULLETIN.

AT Coupeville, Wash., the Eclipse Telephone Company is making a vigorous struggle against its Bell opponent. The Independent company started in business in April, 1902, and since that time the Bell company has been obliged to materially reduce its rates. In spite of the determined opposition with which it has met the Independent company has done very well, and is receiving the hearty support of the majority of the people in its territory.

The enterprise of the management is indicated by the method it has adopted to keep its patrons posted on the advantages of Independent service, and to keep them in mind of actual benefits, financial and otherwise, which they have themselves received since the Independents first began operating. Mr. O. S. Van Olinda, the secretary and manager, issues from time to time a four-page paper which contains information of this nature, as well as bulletins which will be interesting from a service standpoint, and a list of recent additions to the subscribers' list, to serve as a directory supplement. The bulletin is attractively arranged and illustrated with some very pleasing views of local scenery. This idea is one which would seem to be worth while for companies in other sections to investigate.

INDEPENDENT COMPANY WINS FRANCHISE BY ELECTION AT CRETE, NEBRASKA.

RECENTLY the people at Crete, Neb., had a chance to decide whether or not they wished to have Independent telephone service. The vote was so strongly in favor of the Independent company that there could be little doubt of the popularity of the Independents in this vicinity. At a popular election 354 votes were cast in favor of the franchise, while it was opposed by only 87. In conformity with the people's wishes, as shown in this election, the council granted a franchise, five members only voting against the proposition. This the town, and only one voting against the proposition. This franchise was awarded to the Western and Saline Telephone companies, and by them transferred to the newly organized Crete Telephone Company, which will build and operate an exchange. This successful campaign was carried on by B. G. Miller, of Martell, manager of the Kramer-Denton Telephone Company, Neb., who is also to take charge of the Crete Telephone Company, moving his headquarters to the latter place. He was assisted by Frank H. Woods, C. W. Nunemaker and other well known Nebraska Independent telephone men.

FOLK WILL FIGHT USE OF TELEPHONE IN GAMBLING.

GOVERNOR FOLK proposes to fight the gambling evil in Missouri in every form. In order to combat this form of vice he has called a special session of the legislature. The forty-third general assembly enacted a law to prevent race-track gambling, but this does not cover the ground fully. The supreme court of the state declares the act does not apply to bookmakers telephoning their bets out of the state to be registered. This ruling practically nullifies the statute. The governor recommends the enactment of a statute making it a felony to register a bet upon a horse race either on a blackboard or other substance, or to telephone or telegraph a bet on a horse race to any other state to be registered there. This statute was passed, but the emergency clause was overlooked, so that it will not go into effect until June 14, of this year.

TELEPHONE INTERESTS INVOLVED IN ARKANSAS LEGISLATIVE INVESTIGATION.

THE State Attorney of Arkansas is probing the alleged bribing in the State legislature when a bill introduced two years ago by certain Independent interests was killed at the last moment.

Up to the present time only two arrests have been made, but further developments are expected. Senator A. D. Du Laney is charged with accepting two hundred dollars from A. J. Kizer of Texarkana. It is reported to have been shown that the money was paid in the form of a draft handed to Senator Du Laney by Supt. Powell of the Southwestern Telegraph & Telephone Company, but the defendants claim the payment was made in connection with a real estate transaction.

A COSTLY CONVERSATION.

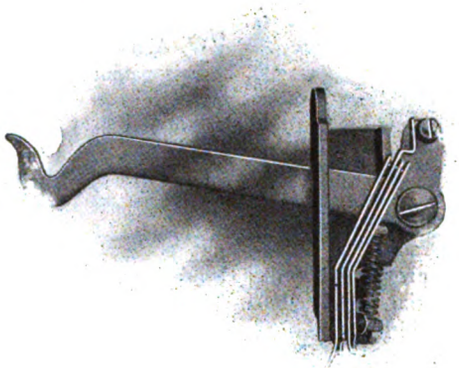
ONE of the most expensive telephone messages recorded recently was reported from Rutherford, Tenn., last week, when a strawberry dealer there paid $38 for an hour's talk with a jobber in St. Paul, Minn. This is an example of the extent to which the general public is becoming educated to the use of the long distance telephone over other methods of communication.

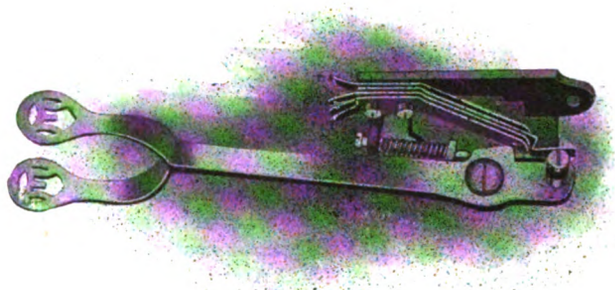
Digitized by Google

The Ericsson Switch Hook

shown by illustrations, is mounted on a base of stamped metal having a grey oxide finish.

The lever is made in one piece of hard rolled sheet brass heavily nickel-plated. The tension is obtained by a steel spiral spring, which is adjustable so as to adapt the switch hook to any weight receiver.





The springs are of German silver with platinum contact points. The spring group is entirely insulated from the base and lever. A hard rubber roller on the lever operates the main spring, eliminating wear and friction.

The same base may be used for the four different kinds of interchangeable levers which are used on the Ericsson Switch hooks. All switch hooks are self-contained and fastened to the telephone by two screws.

In the Field of Invention

TELEPHONE RECEIVER.

A. F. H. Davis, Oakland, California, patent 853,578, May 14, 1907; assigned to National Telegraphone Company, Rochester, N. Y.

This invention relates to a telephone receiver designed for use in conjunction with composite telephone and telegraph systems, in which the electromagnet coils are of very low resistance and the diaphragm of a non-magnetic material.

The action of the diaphragm is due supposedly to the production of Foucault or eddy currents therein. The inventor likens this non-magnetic diaphragm to the secondary of an inductorium. Means are provided in the construction for the proper adjustment of the diaphragm in relation to the poles of the electro magnets.

TRUNKING SYSTEM.

William W. Dean, patent 853,682, May 14, 1907; assigned to Kellogg Swbd. and Supply Co., Chicago.

This invention relates to a method of connecting subscribers' circuits terminating in different exchanges of the Dunbar or two wire type.

LOCKOUT TELEPHONE SYSTEM.

F. Vollmer, Winsted, Minn., patent 851,458, April 23, 1907.

This patent describes a step by step lockout selective system comprising three relays, a battery bell and clock work, together with an indicating device so arranged as to keep the connections in the corresponding instruments at a proper point of connection in the usual step by step method, the clock works arranging for a discontinuance of the connection within a predetermined length of time.

MOUTHPIECE ATTACHMENT.

J. W. Dolson, New York, N. Y., patent 854,472, May 21, 1907.

This device comprises a metal stamping arranged to slide over and grip the transmitter mouthpiece. It is provided with a spindle, upon which is rolled any suitable material which may be pulled before the mouthpiece and there held tightly, the object being to provide a clean surface for each telephone user.

INTERCOMMUNICATING SYSTEM.

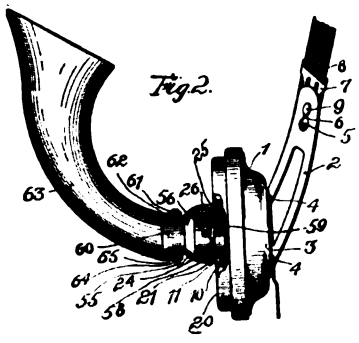
Albert Koch Andriano, San Francisco, California, patents (No. 841,478; dated Jan. 15, 1907; filed August 30, 1901; serial No. 73,801) and assigns to the Direct Line General Telephone Company, San Francisco, Cal., a secret service telephone system.

This patent covers a form of intercommunicating telephone system in which the inventor describes a method and mechanism so arranged that any station may call any other station and having a metallic talking circuit onto which no third station may connect during the period of connection.

BREAST TRANSMITTER.

J. A. Birsfield, Rochester, N. Y., patent 853,337, May 14, 1907; assigned to S. C. Tel. Mfg. Co.

This patent relates to a transmitter which may be used in con-



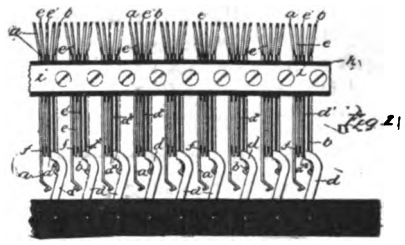
nection with a suspending plate and fastening and worn on the operator's breast. The main features described in the patent are the methods of construction, the chief of which is the substitution of a sheet metal arch in place of the heavy metal bridge usually employed.

In Figure 2 is shown the manner of attaching the swivel joint 26 carrying the curved mouthpiece 63 to the transmitter face plate 20.

SWITCH-BOARD SPRING JACKS.

F. R. McBerty, Evanston, and E. B. Craft, Chicago, Ill., patent 853,370, May 14, 1907, assigned to W. E. Co., Chicago.

This patent describes switch-board spring jacks in which the



spring *d* is so formed as to be rolled into tube shape at one end thus forming the "sleeve" thimble of the jack. The other springs and strip insulations are held and secured in position in the hard rubber portion *h* by the metal strip *i*.

RECEIVER HOLDER.

W. A. Beavan, Philadelphia, Pa., patent 853,672, May 14, 1907.

This patent describes a form of receiver holder consisting of two wire rods so shaped as to be readily attached to the telephone transmitter arm knuckle joint at one end. The other end forming a cradle in which the receiver may rest in close proximity to the subscriber's ear during conversation.

FUSE.

L. B. Buchanan, Woburn, Mass., patent 853,296, May 14, 1907.

The fuse described in this patent is of the enclosed type. It is provided with a spring acting finger, which is held under tension by the fuse wire. The object being a method of indicating the condition of the fuse by merely feeling of this spring finger, which will extend outward from the fuse enclosing cylindrical shell, owing to the cause of tension having been removed upon the disruption of the fuse wire.

INTER-COMMUNICATING SWITCH.

P. Hildebrand, Munich, Germany, patent 854,164, May 21, 1907.

This is descriptive of an automatic switch for telephonic installations. It has a single transmitting and receiving wire, together with a switch dial and a switch disk at each instrument. A contact lever on the disk is operated from the dial, which, when actuated, causes a signal at the instrument of the desired subscriber, also indicating at the same time the number of the calling party to the person called. The called person then moves the disk to the point of connection of the calling instrument, thus completing the talking circuit.

HEAT COIL.

F. B. Cook, Chicago, patent 854,272, May 21, 1907.

This patent describes a heat coil having a conical engaging portion which enters a slot provided in one of the line springs, and so constructed in the coil as to allow of a lessening of the spring pressure when an abnormal current traverses the winding of the coil. This lowering of the pressure allows the engaging portion to drop out of the retaining slot, and by virtue of its tension the holding spring flies back, carrying the coil with it and thus opening the line. When the coil thus held in the spring flies back the movable pin contained therein strikes against a spring provided to force it into its normal position before the fusible material has had an opportunity to harden. Thus the coil is resoldered and restored to its normal condition.

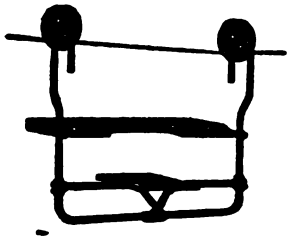
Where the Risk is—Use Security Messenger Cable Cars!

"Cooning a messenger" is the most dangerous thing a lineman does. And not all messenger cars are as safe as they should be—not as safe as Security cars are.



CAR NO. 1.

Once you compare the light, strong, yes and comfortable Security car alongside the heavy, unwieldy, unsightly cars, you'll simply have to say—"the Security for mine."

Our No. 1 car has adjustable seat. The table is extra. Cheap at the price. No. 1 looks well, cannot break, and costs little.

We make a special light car—our No. 3—for use in the repair wagon and to be carried about (it weighs only 28 lbs.)—very strong, serviceable and cheap.

Our Security Book gives prices—get it.

A NEW TESTING TELEPHONE FOR LINEMEN.

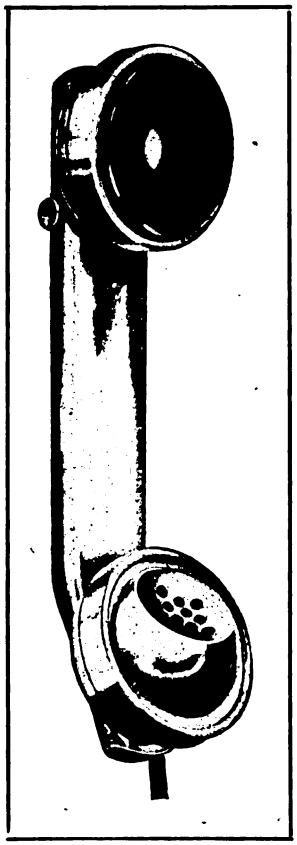
THE "all metal" combination telephone just placed on the market by the Stromberg-Carlson Telephone Manufacturing Co. embodies many features which makes it an especially good instrument for use as a lineman's testing telephone.

The construction of this No. 6-B central energy combination telephone is simple, neat and particularly strong to meet the requirements for this service. It is designed to stand a great deal of rough handling and the manufacturers claim that it has no parts which are perishable in any way. Moisture cannot get into any of the parts, which is an important advantage embodied in this construction.

The frame or handle is made of seamless brass tubing drawn especially for this design, and is so strong as to resist any attempts to bend or dent it. The regular solid back transmitter electrodes are enclosed in a case consisting of three pieces mounted directly on the frame by large screws. The perforated cast brass mouthpiece and clamping ring hold the diaphragm and diaphragm spring in place.

The receiver is the regular operator's type in a specially designed case, having all exterior sides and edges made of metal in order to prevent breaking the ear cap, which is enclosed as much as is practicable. As shown in the illustration, a transmitter cut-out button is arranged just opposite the receiver for preventing the annoyance of side tones taken up by the transmitter when listening in on the line in a noisy place. Both transmitter and receiver interior parts are accessible by unscrewing the clamping rings.

All parts are thoroughly insulated and heavily nickel plated, and a cord equipped with snap clips is furnished for making connections. The complete instrument is not more than eight inches in length and may be carried in the pocket.



Stromberg-Carlson Lineman's Combination Set.

About one hundred of these test sets are in use for central energy service and have received a variety of tests, which the manufacturers say have shown them to be very satisfactory as a lineman's test set under the best and worst conditions which are likely to be met.

The same form of instrument is furnished by the Stromberg-Carlson Telephone Manufacturing Co. with its No. 841, 842 and 843 generator call lineman's test set, including generator, batteries, etc.

F. W. PARDEE INTERESTED IN ELECTRIC SUPPLY HOUSE.

F. W. PARDEE, formerly general manager of the Frank B. Cook company, recently decided to turn his energy and knowledge of the telephone field into a channel in which their expenditure would bring him more complete independence. He has, therefore, associated himself and his delightful personality with three other equally energetic and enthusiastic young men, and is now playing the role of a little friend to all the world as treasurer of the Durant Electric Supplies Company, which has its headquarters located at 56 Fifth avenue, Chicago.

Mr. Pardee has been associated with the Frank B. Cook company for the last three years, in which time that company enjoyed much success, largely due to Mr. Pardee's untiring efforts and cheery good nature. Much regret was manifested by every one in the Cook organization upon receipt of his resignation, and before leaving he was tendered a surprise dinner party at which a handsome gold watch was presented him. In the back of this token were inscribed some very kindly sentiments. Previous to his association with this company he filled the chair of general sales agent of the Chicago Writing Machine Company.

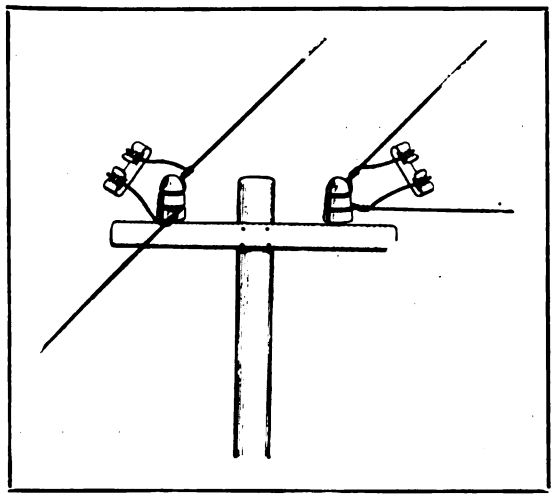
Mr. Pardee states that he and his associates intend working night and day, including all holidays, to keep their customers promptly and properly supplied with the best of everything the market affords.

CENTURY TELEPHONE CONSTRUCTION COMPANY, Buffalo, N. Y., has recently arranged to open up a branch house in Kansas City, and by June 15 the company will be in position to ship Century telephones and supplies from that point throughout the Southwest. The company also contemplates establishing a branch house in Chicago at an early date.

THE AUTOMATIC ELECTRIC COMPANY, Chicago, Ill., in its recently issued book, "Messages to New York," has reproduced many telegrams to the Mayor of New York city, showing the feeling of prominent city officials and telephone men toward Independent companies and the automatic system. The book is bound in a cover which carries out the idea of the title in a striking way.

As advertising material it deserves most favorable mention, and in addition to this will interest operating men who wish to keep in touch with general conditions.

THE LEEDS AND NORTHRUP COMPANY, 4901 Stenton avenue, Philadelphia, Pa., has recently issued a circular describing its L. & N. direct reading ohmmeter. This device reads resistance as an ammeter reads current, and is so designed that its correct operation is independent of fluctuations in the operating voltage. The scales are so designed as to make the percentage of accuracy approximately the same for all readings. The instruments may be furnished for practically any desired range. The company will be pleased to send full information on receipt of a request.



Arrangement of Fahnestock Test Openers.

FAHNESTOCK ELECTRIC COMPANY, 129 Patchen avenue, Brooklyn, N. Y., has just put on the market a new test opener. The purpose of this little piece of apparatus, as is well known, is to furnish a lineman an easy means of breaking the continuity of a line without the necessity of splicing it up again. The Fahnestock device, as actually used in practice, is shown in the accompanying illustration. It is constructed on the same principle as the well known Fahnestock spring binding post, and is claimed to embody the advantages of speed and facility in handling and other good points which the manufacturer will be pleased to explain to those interested upon receipt of inquiry.

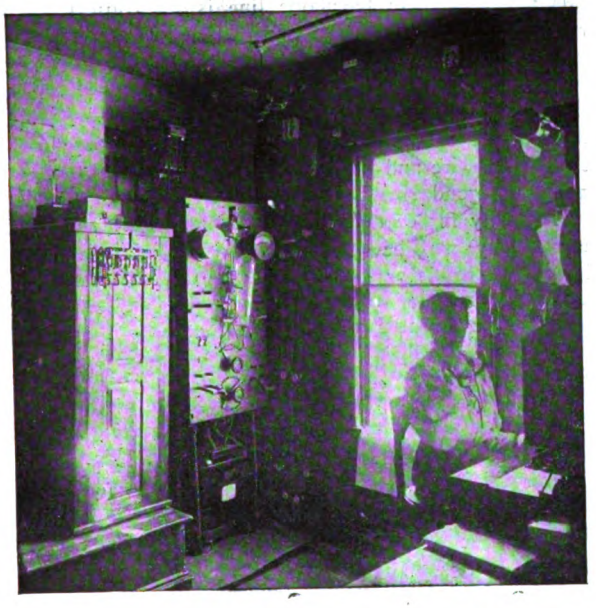
General Electric Company

Battery Charging Without Noise

The Mercury Arc Rectifier changes alternating current to direct current of any voltage required for charging telephone storage batteries.

It has no moving parts and makes no noise either in the room or in the receiver : : :

Current is rectified by mercury vapor in a vacuum tube without moving conductors or contacts of any kind.



The noiseless operation of the rectifier permits its location in any convenient space available.

Would you install any motor generator set so near the operator?

The entire plant occupies no more floor space than a motor generator power board and its operation involves no expert knowledge or experience.

WHAT A FIRST-CLASS TELEPHONE SWITCH MEANS.

THE man who buys telephone switches has a natural tendency to select the cheapest, and why shouldn't he? They all look very much alike and the difference in price, though slight, rings just as pleasantly in his pocket as in that of any one else.

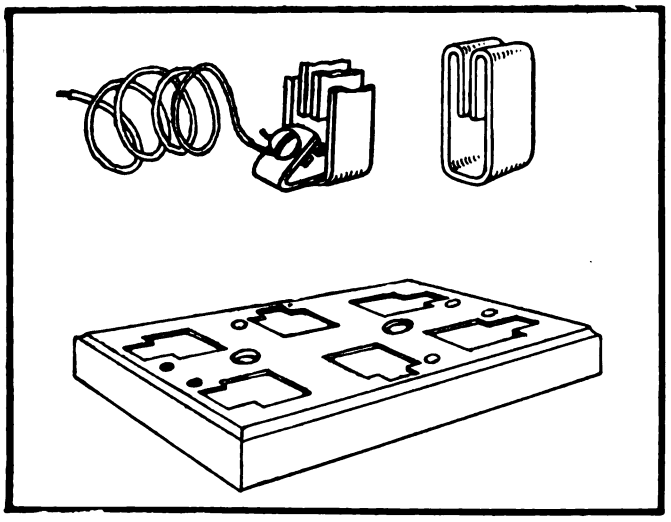
Telephone switches, however, are not liable to contain numerous faults, and as these are only evident when carefully looked for, the prospective purchaser should know just where to find them. The chief difficulties found in telephone switches come from warped bases, loosening of clips and poor alignment. All these difficulties are reduced to a minimum in a first-class switch of proper design and construction.

Trumbull Electric Manufacturing Company states that in its well-known switches it overcomes these difficulties as follows: Selected porcelain which is not warped is used exclusively for the bases. Recesses in the base hold the clips firmly and keep the alignment, so that when substantial screws fasten the clips there is absolutely no chance for loosening, and when self-adjusting clips hold the blade, the alignment is accurate. By self-adjusting clips the company means those that by their peculiar design enable the resilient force of the copper to insure a perfect contact with the blades.

Even with all possible care in mechanical design the serviceable switch must be correctly assembled, and it takes skilled workmen to do this. Small girls and boys, or shiftless men, cannot do the work properly.

This class of labor will from time to time forget to tighten a screw, fail to notice a defective clip or base, and so counteract all advantages in the design. In addition to these prime necessities in the production of a first-class switch there enters the element of convenience. It is necesary to have holes in the base at each clip for concealed work. Also a good point is to have the binding contacts raised from the base for convenience in attaching wires, and to have these wires held tightly under the head of the screws to avoid being cut or scored.

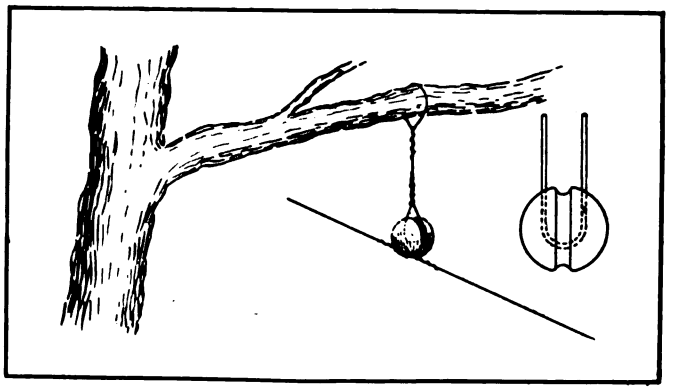
It pays for the man who wants satisfaction and the longest possible service to consistently consider the real points which determine the value of the goods. By writing to the Trumbull Electric Manufacturing Company at Plainville, Conn., one may obtain a great deal of very interesting general information about switches.



Details of Porcelain Base, Clips, and Wire Attachment of Trumbull Switch.

CLAYDON TREE INSULATORS.

IN the Southwest, where rural lines must be built between widely separated houses, it is very important that the construction should be as economical as possible. Charles Claydon & Sons, Kurten, Tex., have devised a form of support which they call a tree insulator, which has given good satisfaction in use in this section, and seems to be available in other localities. The method of its use and its form is shown in the accompanying illustration. It enables a telephone company to take advantage of natural supports, such as trees, fence posts, etc., all that is necessary being to attach the insulator by the loop which is provided at one end, the wire being moulded deep into the glass for this purpose. The telephone line is then inserted in the groove and tied in the usual manner.



Novel Method of Supporting Telephone Line, and Insulator Designed by Charles Claydon.

For use in dry climates the company manufactures a small size insulator, which has been used very satisfactorily in Texas, but the demand has been so extensive that it has now taken up the manufacture of a large insulator, giving a broader surface between the tie wire and the supporting loop. It is believed that this will give good satisfaction in northern climates, where a similar necessity for economy in constructing rural lines exists.

The company will be pleased to forward information and samples of this insulator to all operators of rural lines who are interested, upon receipt of a request.

RECENT DEAN CONTRACTS.

THE Dean Electric Company, of Elyria, O., has secured a contract for a three section magneto multiple switchboard for Nebraska City, Neb. This is the second large magneto board sold recently in this territory. The Nebraska City board will have six hundred lines equipped and the Dean company will furnish the plant complete, including the Dean harmonic 4 and 8 party selective ringing equipment, individual ringing keys on each position, and racks. A combined toll and rural board goes with this installation.

Grafton, W. Va., has ordered a common battery lamp signal non-multiple switchboard with 300 lines equipped for immediate use. The Dean Electric Company furnishes the cross connecting and relay racks, power plant complete and full Dean harmonic selective party line ringing equipment for party line service.

Colusa, Cal., has ordered six common battery switchboards. These boards are for the Colusa County Telephone Company. Each board is to be arranged for 4 and 8 party selective party line ringing. A complete Dean harmonic converter goes with the selective ringing equipment for each board. A great many of these harmonic converters have recently been ordered and they are said to be meeting with great favor on the Pacific coast. The Dean company states that when these machines are once understood they are greatly admired by the progressive telephone companies, as they are economical in operation and not prohibitive in first cost. This latter fact is especially important to the small exchange.

SAMUEL BERLINER, who has for the past year and a half been connected with the Automatic Electric Company, Chicago, Ill., has recently gone to Vienna, Austria, to accept a position as superintendent of a telephone manufacturing company.

QUALITY

TELEPHONE AND SWITCHBOARD CORDS

RECEIVER CORDS--Green Silk--Worsted--Cotton

The conductors of these cords are made of sixteen (16) ends braided copper tinsel—braiding sixteen (16) No. 20—2 ply green cotton threads—external individual braiding twenty-four (24) green spun machine silk threads.

Tinsel—Average	breaking strength	*each thread*—24	ounces.
Cotton—Average	breaking strength	*each thread*—25	ounces.
Cotton—Number	yards single thread	*per pound*—8400	
Silk —Average	breaking strength	*each thread*—48	ounces.
Silk —Number	yards single thread	*per ounce*—570	(Min.).

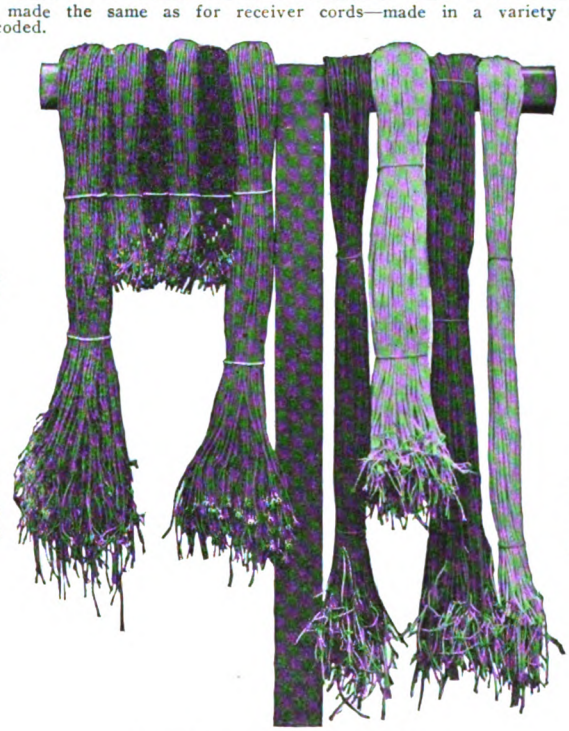
The *Worsted* and *Cotton* Receiver Cords are made with the different materials named as an external covering.

DESK TELEPHONE CORDS--Green Silk

The conductors are made the same as for receiver cords—made in a variety of combinations of conductors, each properly coded.

RECEIVER CORDS
(Two Conductor)

Furnished 30"-33"-36" lengths.



SWITCHBOARD CORDS
(Two and Three Conductors)

DESK TELEPHONE CORDS
(Any number conductors)

Furnished 6 ft. and 8 ft. lengths. Other lengths special orders.

TINSEL AND STEEL

Furnished 5 ft., 6 ft., 7 ft., 8 ft., 10 ft. lengths.

Specify length and type of plug.

SWITCHBOARD CORDS

Tinsel—The conductors of twenty-four (24) braided copper tinsel threads insulated with a braiding of *Tussah Silk* and a braided cotton serving are enclosed in a spring brass wire helix of proper diameter. Over these conductors protected by flexible helix is placed an external reinforced braiding of glazed cotton, or linen, as specified.

Steel—The conductors of round tinned steel wire and evenly formed around the core of the cord in opposite directions. Tussah Silk serving, braided cotton and braided linen insulation is placed between each wire. These cords are very strong, flexible and neatly finished.

Good News—and It's All New

NEW COMPANIES.

PARKER, ARIZ.—Articles of incorporation have been filed by the Colorado River Telephone & Telegraph Company. Its principal place of business is to be at Parker, but other offices may be established within or outside of Arizona. The capital stock of the company is given at $100,000, divided into one thousand shares of one hundred dollars each, and the following directors have been elected: F. O. Richmond, O. McCormick and O. B. Roberts.

UNION MILLS, IND.—The Northern Indiana Telephone Company has been incorporated with a capital stock of $10,000, and the following directors named: Thomas E. Edminson, J. F. Underwood, J. R. Bailey. It is its intention to build an exchange in Union Mills, and extend lines throughout portions of Laporte, Porter, Starke and St. Joseph counties.

FOX LAKE. MINN.—The Fox Lake Telephone Company has been incorporated and work upon its lines commenced. Among those interested in the enterprise are A. Hanson, C. Sievert, J. Dwanons, C. Blanchar, E. Mahoney and others. Connections will be established with the Fairmont Telephone Company at Sherburn.

MOTLEY, MINN.—An Independent telephone company, to be known as the Motley Local Telephone Company, has been organized at this city, and the following officers and directors elected: V. Lockwood, president; G. D. Crossette, secretary; S. W. Jacobs, treasurer; directors, E. G. Haymaker, Alfred Wilson, C. E. Seely.

BUTTS, MO.—An Independent telephone company, whose intention is to construct a line from Butts to Steeleville, is being organized by the farmers of this city, and already quite a sum of money has been subscribed.

GENEVA, NEB.—The Farmers' Independent Telephone Company, with a capital stock of $100,000, has been organized, and the following officers elected: J. M. Ward, president; H. R. Deming, vice-president, and J. H. Morgan, secretary.

NORTON, N. D.—Articles of incorporation have been filed by the Norton Farmers' Telephone Company of this city. It has an authorized capital stock of $10,000, and the incorporators are Harry Fletcher, Carl L. Johnson, of Vesta township, and Anders J. Bylin, of Norton township.

BLANCHESTER, O.—The Farmers' Mutual Telephone Company has been organized in the vicinity of Butlerville (P. O. address Blanchester, O.), and the following officers and directors elected: E. H. Smith, president; Jesse Spurling, treasurer; Thomas Sharp, secretary; directors, E. H. Smith, Jesse Spurling, Thomas Sharp, Frank Carroll, E. D. Jones. The company's exchange is to be located at Butlerville, and lines built to Pleasant Plain, Rossburg, Level, Middleboro and Blanchester. The company has already secured about sixty subscribers.

WILKES-BARRE, PA.—The Conyngham Valley Telephone Company has filed articles of incorporation. It has a capital stock of $20,000, consisting of 800 shares at $25.00 each, and the following directors have been elected: Harry H. Swainbank and L. A. Dymond, of Wilkes-Barre, and A. F. Dymon, of Huntington Mills. The general offices of the company are located at Wilkes-Barre, and it will operate lines between East Butler township and Sheppton, Schuylkill county.

MALONE, TEXAS.—The Manning Telephone Company, which has an authorized capital stock of $15,000, has filed articles of incorporation. Among the incorporators are W. J. Manning, W. R. Alford, H. Henderson and others.

ACKERVILLE, WIS.—The Washington County Telephone Company, whose intention it is to construct lines between Ackerville and Lawrence, has been incorporated with a capital stock of $1,500.

BARABOO, WIS.—An Independent telephone company has been formed by the farmers in the vicinity of Skillet Creek. Among those actively interested in the new company are William Wickern, William Alwin, Wilbur Cowles, Albert Wickern and Charles Spencer.

NORTHFIELD, WIS.—Articles of incorporation have been filed by the Northfield Farmers' Telephone Company, of Northfield. It has an authorized capital stock of $7,000, and the incorporators are B. P. Lanning, Antone Ellingson and John Dettinger.

QUARRY, WIS.—The Quarry Riverside Telephone Company has been incorporated with a capital stock of $2,000, and among the incorporators are Ole Lotten, A. H. Alfrom, K. H. Thompson and others.

YELLOWLAKE, WIS.—The Yellow River Division of the Badger Farmers' Mutual Telephone Company has been organized, and work on the system will be commenced very soon. The following officers and directors have been named by the new company: M. F. French, president; Herb Magoon, vice-president; Chas. French, secretary; N. P. Ekblom, Frank Magoon, Gust Larson and O. H. Christianson.

ST. MARY'S, ONT., CAN.—Articles of incorporation have been filed by the St. Mary's-Medina Telephone Company, Ltd. The capital stock is placed at $40,000, and the principal offices are to be located at St. Mary's.

FRANCHISES.

WAYNE, N. Y.—The Wayne-Monroe Telephone Company has been granted a franchise to enter Naples.

ROCK HILL, S. C.—Application for a twenty-five year franchise has been made by the Rock Hill Telephone Company, whose intention it is to install a common battery system at this place.

SENECA, S. D.—The Seneca Telephone Exchange Company has been granted a franchise by the town board of Seneca, and work on the construction of its system will be commenced at once.

WITTENBERG, WIS.—Application for a telephone franchise has been made by John Eckhoff at this city.

EAST TORONTO, ONT., CAN.—The town council of this city has decided to grant a franchise to the Independent Telephone Company, which now operates in York, Markham, Scarboro, etc., and it will soon begin the installation of its system at this place.

FINANCIAL.

PLEASANT HILL, ILL.—The Farmers' Mutual Telephone Company has increased its capital stock from $2,500 to $22,000.

TOBINSPORT, IND.—The capital stock of the Tobinsport Telephone Company has been increased from $1,000 to $1,500.

GREENE, N. Y.—The Chenango-Broome Telephone Company has increased its capital stock from $700 to $1,100.

DAYTON, O.—The Home Telephone Company, of Dayton, has increased its capital stock from $1,200,000 to $2,000,000.

BLACK RIVER FALLS, WIS.—The capital stock of the Central Wisconsin Telephone Company has been increased from $50,000 to $100,000.

CAROLINE, WIS.—The Farmers' Independent Telephone Company has filed an amendment increasing its capital stock from $2,500 to $10,000.

BALDWIN, WIS.—The Rush River & Eau Galle Telephone Company has increased its capital stock from $3,520 to $12,000.

ELECTIONS.

NEZ PERCE, IDAHO.—The following compose the Board of Directors of the Nez Perce Co-Operative Telephone Company: H. H. Nuxoll, Cottonwood; P. W. Mitchell, Nez Perce; J. M. Magee, Mohler; O. W. Clark and Dr. J. Lenz, Ilo.

ENTERPRISE, KAS.—At the annual election of the Brownlow Telephone Company, held at this city recently, the following officers were elected: President, S. S. Peebler; secretary, W. H. Baker; treasurer, F. H. Comstock.

SLEEPY EYE, MINN.—The Local Rural Telephone Company has elected the following officers and directors: President, I. M. Olsen; vice-president, C. P. Cutting; secretary, Wm. Brust; treasurer, F. J. Riedl; directors, W. F. Kelm, Henry Dorhman, H. G. Hillesheim, Emil Rasmussen and W. G. Raverty.

CHARDON, O.—The following officers and directors have been elected by the Chardon Telephone Company: President, Orange Pomeroy; vice-president, Andrew Warner; secretary, W. C. Parsons; treasurer, S. S. Smith. Directors: Orange Pomeroy, F. S. Pomeroy, J. E. Ogden, E. R. Matthews, W. L. Sprague, Andrew Warner and W. C. Parsons.

MANTI, UTAH.—The Manti Telephone Company has elected the following directors: A. H. Sorenson, Stanley Crawford and Quince Crawford. It is a recently organized company and expects to build lines in the southern part of the state and in Sanpete county.

MISCELLANEOUS.

SULLIVAN, ILL.—Plans are being considered for the absorption of the Sullivan Telephone Company by the Mutual Telephone Company.

JACKSON, KY.—The telephone plant at this city has become the property of J. T. Pickets, of Mt. Sterling; Nicholas Hadden, J. D. Young, Jr., and others. Articles of incorporation have been filed and it is the intention of the new company to make many improvements and extensions in the system.

SILVER CREEK, NEB.—A half interest in the Silver Creek Telephone Company has been acquired by George Creeman.

DARRTOWN, O.—A reorganization has been effected of the Darrtown Telephone Company, and the following officers elected: President, W. Gilbert Thompson; vice president, treasurer and general manager,

WANTED—SPECIAL CORRESPONDENTS

OWING to the rapid growth of the Independent telephone movement in all sections of the country, we have openings for special correspondents in every State to work in conjunction with our already efficient corps. Matter similar to that in our Message and Operating Field pages is especially desired. For details address the Editor.

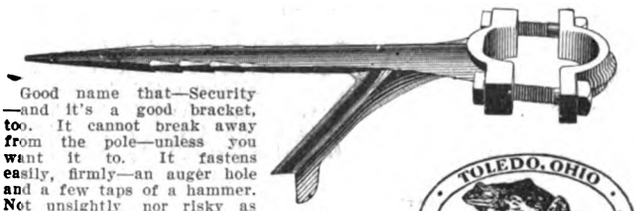
MICHIGAN WHITE CEDAR POLES

We have a large stock of White Cedar Poles of all sizes, concentrated at a point on the D. & M. R. R. in lower Michigan, from which we can make prompt deliveries. The location of this stock offers exceptional facilities for shipments to all points in Ohio, Indiana, Southern Michigan and the Eastern States. Write us for delivered prices on any size for immediate shipment.

KELLOGG SWITCHBOARD & SUPPLY CO.

CHICAGO, ILL.

SECURITY POTHEAD BRACKETS



Good name that—Security—and it's a good bracket, too. It cannot break away from the pole—unless you want it to. It fastens easily, firmly—an auger hole and a few taps of a hammer. Not unsightly nor risky as the old style brackets.

When the pole's worn out transfer it to another pole. Yes—it's cheap, too. Why not get our Security book? It gives facts and figures.

THE F. BISSELL COMPANY, TOLEDO, O.

226-230 HURON STREET

Pole Setting Time

and the high prices you have had to pay for Poles surely has impressed you with the necessity of making them last longer.

Avenarius Carbolineum

(Registered)

has been on trial for over 30 years by leading telephone and telegraph companies, Railway companies, the U. S. Government, etc. By simply painting your poles with it, it will more than double their life. It is inexpensive.

Good News—And It's All New

MISCELLANEOUS.

L. A. Miller; secretary, John F. Mee; directors, S. H. Allen, of Oxford; E. M. Miller, of Darrtown; E. L. Miller, of Darrtown; W. G. Thompson, of Hamilton. It is the intention of the new company to install a modern, up-to-date plant at this city.

JACKSON, TENN.—The Jackson Home Telephone Company of Jackson was recently reorganized at Wyoming, and the following officers and directors elected: William Drury, president; Frank P. Hopper, vice-president; Richard E. Hutchins, secretary; James W. Allan, treasurer; directors, Robert T. Pettebone, Frank P. Hopper, William Drury, E. R. Pettebone, Guy W. Moore, Thomas Thomas, Charles E. Smith, R. S. Sprigins, W. D. Anderson, R. E. Hutchins and James W. Allan.

MOUNT HOLLY, VT.—The Mt. Holly Telephone Company has been reorganized and the following officers elected: President, B. E. Horton; vice president, I. L. Hill; secretary, Howland Marshall; assistant secretary, E. S. Burton; treasurer, J. D. S. Packer; directors, A. E. Hammond, W. H. White and Fred White. The new company expects to extend its system to Tarbellville and East Wallingford.

WITTENBERG, WIS.—The Wittenberg Independent Telephone Exchange has become the property of J. F. Eckhoff & Son, who will build new toll lines.

COMBINATIONS.

DES MOINES, IA.—A merger has been effected between the Des Moines Mutual Telephone Company and the following companies: The Hawkeye Telephone Company, Perry; the Boone Telephone Company, Boone; the Jasper Telephone Company, Colfax; the Iowa Southern Telephone Company, Des Moines; the Knoxville Electric Company, Knoxville. An amendment to its articles of agreement has been filed by the Des Moines Mutual Telephone Company increasing its capital stock from $450,000 to $1,600,000.

WATERLOO, IA.—The Farmers' Mutual Telephone Company of New Hartford is to be absorbed by the Corn Belt Telephone Company. The Farmers' company operates about 145 miles of line, including exchanges at New Hartford, Parkersburg, Dike and other places.

MARTINSVILLE, MO.—Connections are to be formed between the Harrison County Mutual Telephone Company's exchanges at Martinsville, Brooklyn, New Hampton, Eagleville, Washington Center, Ridgeway and Denver, Mo., and the Farmer's Mutual Telephone Company's exchanges at Bethany, Melbourne, Modena, Coffeysburg, Mt. Moriah, Matkins, Gilman and Spickardsville.

WASHINGTON, PA.—A charter covering the consolidation of the Carmichaels and other Independent lines in Greene county has been granted to the Greene County Telephone Company.

BLUEFIELD, WEST VA.—The Tazewell Telephone Exchange and all the lines in Tazewell county have become the property of the Bluefield Telephone Co. The newly acquired property will give the Bluefield company connections with all the important points in Tazewell county, and lines running as far west as Raven.

PERSONAL.

E. GRAHAM, who has been manager of the Citizens' Telephone Co., Paris, Tex., during the past year, has accepted a position as general superintendent of the Texarkana Co. at Texarkana. Mr. Graham is a hustler of known ability, and will do much to keep things at Texarkana on the move in the right direction.

HARRY HANFORD succeeds Mr. Halsey as manager of the Philippine Islands Telephone & Telegraph Co. at Manila, P. I. Mr. Hanford has been associated for the past six years with the firm of Castle Brothers, Wolf & Sons, of Manila.

B. C. KETRING has succeeded H. R. Miller as manager of the American Union Telephone Co. in Altoona, Pa., and has assumed his duties at that that point. Mr. Ketring formerly had charge of the company's business at Phillipsburg.

With the Builders

WOODLAND, CAL.—The Farmers' Telephone Company, which operates lines between Madison, Yolo, Black's, Tule and Henle, contemplates the erection of a line from Knights Landing to Woodland.

COEUR D'ALENE, IDAHO.—The Interstate Telephone Company, which has just completed the installation of its system at this city, with a capacity of five hundred lines, expects to increase its plant very materially.

NEZ PERCE, IDAHO.—It is the intention of the Nez Perce Co-Operative Telephone Company to improve its system at this city, and to install new telephones in Lewiston. Lines from Dublin to Lawyer's Canyon, and from Ilo to Nez Perce are also to be constructed.

MADISON, IND.—Many extensions are to be made in the plant of the Madison Telephone Company, and much new equipment installed.

EARLHAM, IOWA.—Toll lines from Earlham to Adel, Redfield and Winterset are being constructed by the Adams Township Telephone Company.

MERRILL, IOWA.—The Farmers Mutual Telephone Company is extending its lines and otherwise improving its system.

THAYER, KAS.—The Thayer Telephone Company is constructing a line from Thayer to Earlton.

SKOWHEGAN, ME.—It is the intention of the Maine Telephone Company to expend $20,000 in improving its plant. A new switchboard is to be installed, and its lines entirely rebuilt.

ELMIRA, MICH.—It is the intention of the Home Telephone Company to extend its system to connect with the Gaylord system.

LAKE ANN, MICH.—Work on the construction of its system has been commenced by the Lake Ann & Oviatt Telephone Company. The line will eventually reach Maple City.

NORBORNE, MO.—The Stet-Rockingham & Norborne Telephone Company is to commence the erection of its exchange building.

REDWOOD FALLS, MINN.—A number of new rural lines are to be built by the Rural Telephone Company of this city.

JACKSON, MISS.—The Home Telephone Company, which was recently granted a franchise at this city, is to commence the construction of its system.

ANACONDA, MONTANA.—The Independent Telephone Company has commenced the construction of its system.

SPALDING, NEB.—The Independent Telephone Company is at work on the installation of its exchange in this city, and it also expects to build lines into the surrounding country.

TONOPAH, NEV.—Work is soon to commence on the new line which the Tonopah & Ely Telephone & Telegraph Company is to build. It will extend from Tonopah through Bellehelen, Golden Arrow, Hot Creek, Reveille, Duckwater and on to Ely.

EAST SPRINGFIELD, N. Y.—The East Springfield Telephone Company, which has just completed a line to Pleasant Brook, is building a line to Sharon Springs.

WESTFIELD, N. Y.—It is the intention of the Westfield Telephone Company to expend $10,000 in the installation of an up-to-date exchange in this city.

YOUNGSTOWN, O.—New lines are being built by the Youngstown Telephone Company.

GARDINER, ORE.—A new line between Gardiner and Sulphur Springs is to be erected by the Coos Bay & Umoqua Telephone Company.

AMBLER, PA.—The Keystone Telephone Company expects to extend its lines from Ambler to Doylestown, taking in Penllyn, Gwynedd, North Wales, Lansdale and other towns.

MEADVILLE, PA.—A new line is being built in eastern Cussewago, which will give communication to the farmers in Crawford county. The line is to be about ten miles in length, and will be made part of the Saegertown exchange. A new line is also being erected to the south of Conneaut Lake, which will connect Meadville, Conneaut Lake, Geneva and other places in the county.

LITTLE RIVER, S. C.—An Independent telephone line is to be constructed from Little River, S. C., to Southport, N. C. Among those interested in the new enterprise are B. O. Stone, of Wilmington, N. C., and others.

FREDERICK, S. D.—A local exchange is to be installed at Frederick by the Groton-Ferney Telephone Company.

LYNNVILLE, TENN.—A new toll exchange is to be established at this city by the Home Telephone Company.

CASTLEDALE, UTAH.—A local telephone system is being installed at Castledale by the Eastern Utah Telephone Company. Those having charge of the work are O. J. Harmon, of Price, and N. C. Christensen, of Cleveland.

CABOT, VT.—Many improvements are being made in the plant of the Molly Falls Telephone Company.

EAST WALLINGFORD, VT.—It is the intention of the Rutland County Telephone Company to build lines to connect with the Mount Holly Telephone Company at East Wallingford.

LEWISBURG, VA.—Work on the plant of the newly organized Limestone Telephone Company is to commence at once.

HOQUIAM, WASH.—The new Independent telephone company, which was granted a franchise at this place several months ago to compete with the Sunset (Bell) Telephone Company, has commenced the construction of its plant.

ATHENS, WIS.—It is the intention of the Athens Telephone Company to expend about $5,000 in improving and extending its system. Lines are to built east and west of Athens, extending to Halsey, Johnson, Hamburg and other places.

BANGOR, WIS.—About $3,000 is to be spent by the Bangor Telephone Company in improving its system.

LA CROSSE, WIS.—Lines are being built by the La Crosse Telephone Company from La Crosse to West Salem.

UNDERGROUND.

WASHINGTON, PA.—The State Mutual Telephone & Telegraph Company has been granted permission to construct a conduit system in this city.

BEWARE OF IMITATIONS

For the protection of our customers we advise that Klein's Pliers are being imitated to LOOK LIKE KLEIN'S. This, however, does not make them Klein's. CAUTION Look for this stamp, M. KLEIN & SONS, on the inside of handles—NONE are genuine without this stamp.
Use only genuine Klein's. They are the product of years of experience and have stood the test of time.
MATHIAS KLEIN & SONS - CHICAGO, ILL.

MUST BE RUBBED IN
Advertising, like liniment, doesn't do much good when applied with a feather. It needs to be rubbed in for results. Apply it through the right mediums to the right people at the right time, and keep on rubbing it in until returns begin to come. Then still keep on rubbing.—*Jed Scatboro, in Profitable Advertising.*

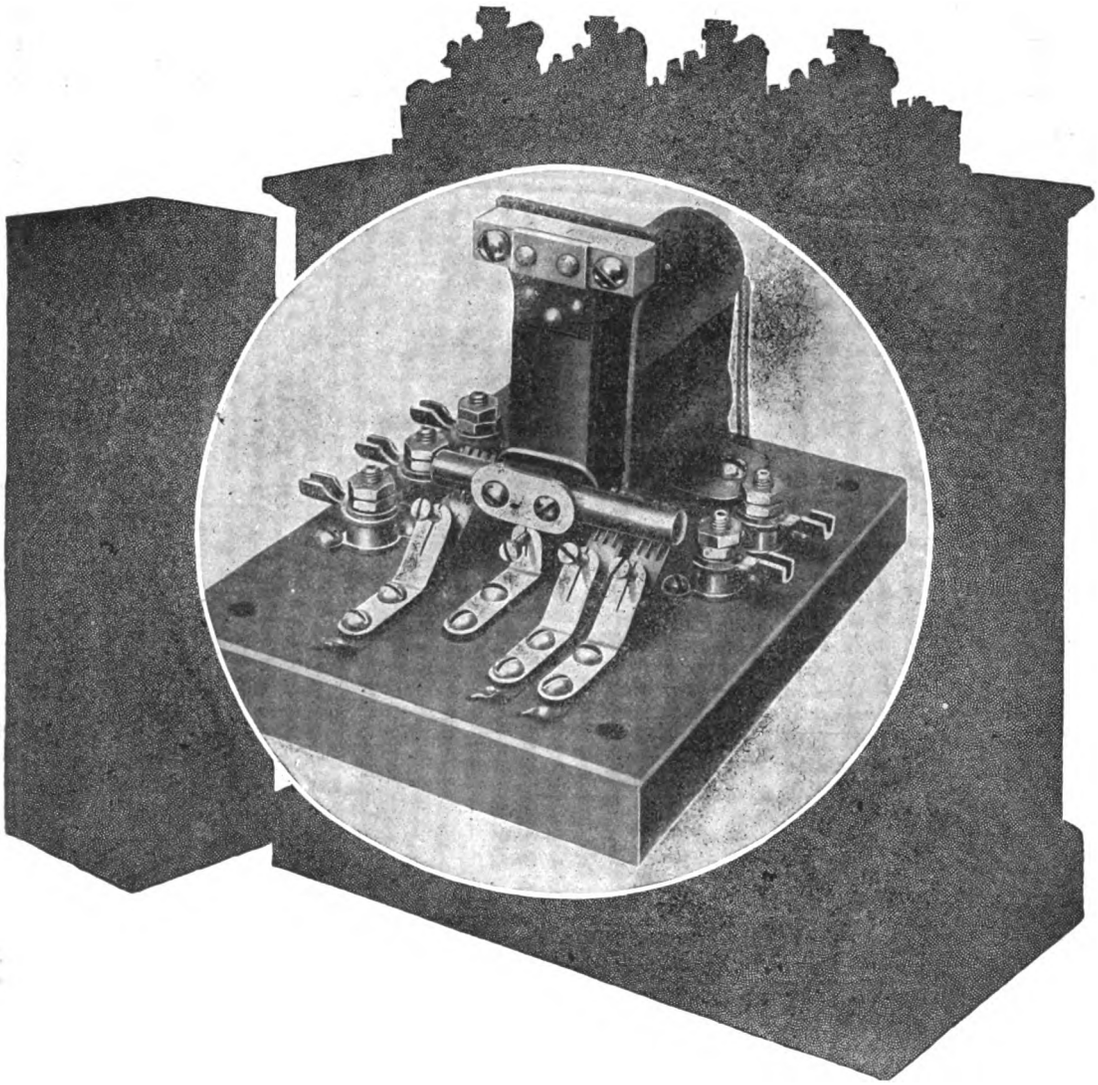
DEAN TELEPHONE APPARATUS

A Dean Electric Detail--Harmonic Converter Relay for Starting the Selective Vibrators



This Primary Circuit Closing Relay in our Harmonic Converter is for closing the circuits of the transformer primaries of the Dean Harmonic Converter, and is especially designed for small exchanges where dry cells are used for the ringing current. A minimum current consumption is imperative for party line selective signaling in the small exchange. This relay, operated by a circuit extending to special contacts on the ringing key at the switchboard, is entirely automatic, not in any way depending on the operator for its prompt and accurate action. It actually starts the selective vibrator and consumes absolutely no current except during the period that the operator is ringing the subscriber. Our folder No. 5 should be in your possession if you wish to have your selective ringing knowledge complete.

All Kellogg Telephone Parts

Are Made From the Best Grades of Material and Are Carefully Assembled by Skilled Workmen, Thus Making Everything High-Grade Throughout

Kellogg Portable Desk Telephone,
For Central Battery or Magneto Use.

The tubular hard-rubber covered standard, with hollow brass shell, nickel plated base, is distinctively KELLOGG.

The transmitter hinges at top of standard, and there is mounted in base the hook switch and hard-rubber terminal block for receiver and desk stand cords.

The hook switch is of the toggle joint type, having a long motion of the springs, thus obtaining most excellent contacts with only a minimum motion of hook.

All necessary parts are properly insulated, are easy of access and everything is made as nearly dust proof as possible.

THIS IS WHY

Hercules Anchor

(PATENTED)

The Iron Dead Man

Made in five sizes, from that for 20-foot pole to large one for extremely heavy strains, wrecking trains, etc.

They are the best anchor in every way for holding up heavy leads and round corners. Easy to set, pull against solid earth and will not creep.

As they are made of Malleable Iron, they are practically indestructible. All anchor plates guaranteed.

Send for descriptive circulars and prices.

Manufactured by

THE W. G. NAGEL ELECTRIC CO.

26-30 ST. CLAIR ST., TOLEDO, O.

SIMPLICITY

Note how easy it is to splice pairs when you use HARGIS CABLE SPLICING JOINTS. Note how easy it is to get into the joint in case you have to test out for trouble.

If you are stringing several lengths of cable and a storm blows up, you can get your cable ends into a moisture-proof HARGIS JOINT in no time and thus prevent moisture from getting into your cables. When the weather clears up, your lineman can go out and splice the pairs in each joint.

While an expert cable splicer is rigging up his platform, etc., to start to work on a horizontal joint, a lineman can wipe in a HARGIS JOINT. The lineman can have all his pairs spliced and be off to the next job about the time the expert splicer would be ready to begin wiping the second end of his horizontal joint.

Making a splice with a HARGIS JOINT is so easy that you don't need a cable platform. There is no need for a drip pan to catch the paraffine, because the HARGIS JOINT is submerged in the paraffine pot, and there is no waste. The moisture has to go out. No uncertainty.

Years of development and experience have shown that the telephone subscribers demand a pay station from which all points of uncertainty have been eliminated

THE LIVERMORE
One-Slot Pay Station

fills these requisites completely.

There is absolutely nothing for the subscriber to do but drop the coin. Any coin the operator specifies is dropped in the ONE SLOT where it automatically chooses the correct path and registers its individual signal.

The signals are mounted, together with the transmitter, on a bell resonator, which is insulated from the box and the coin chutes.

The operator thus receives the clear, easily distinguishable signal only and none of the rattling or outside pounding.

The Livermore Pay Station has only One Slot. There are no Levers, no Air Pumps, no Springs, no Knives, no Clock Work, no Push Buttons

NO TROUBLE IN THE LIVERMORE ONE-SLOT PAY STATION

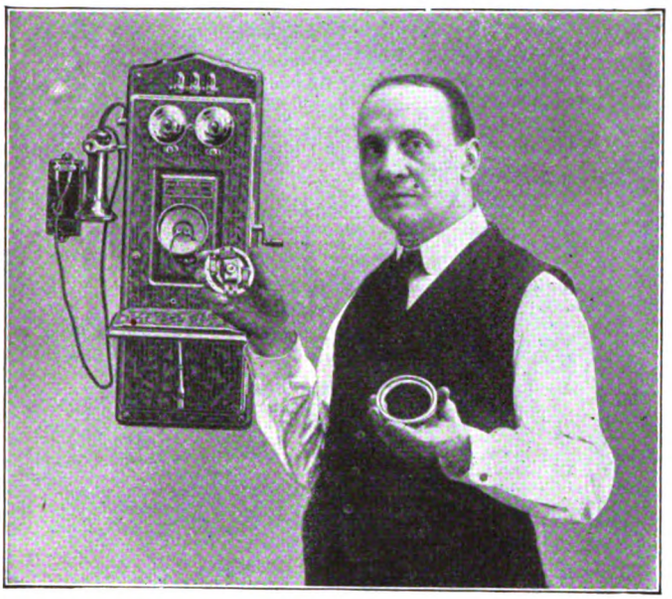
ANDRAE



No Trick at All.

Talks With the Trouble Man

Did you ever take the little screws out of the case of your transmitter and have them drop on the floor, then spend an hour trying to find them and finally give it up in disgust? This never happens with the ANDRAE TRANSMITTER. There are no screws in the case. It is clamped together by a large threaded ring, easily removed and yet firm and positive in its grip. Our transmitter never gets loose or vibrates and its mechanical construction is the best yet produced.

When it comes to talking, this transmitter can't be beat. There is no rattle or jar to it, but just a clear, positive reproduction of the voice. It is made up of imported French carbon granules that never pack.

One of the best illustrations of the workmanship in this transmitter is the fact that it has now been on the market for six (6) years, backed by an unlimited guarantee and the number replaced has not been worth mentioning.

It is like all the rest of the Special Heavy GIANT Bridging Telephone. It is built for business and the harder you work it the better it works. You may try them at our expense.

CONDENSERS

We have been shipping condensers to London and Honolulu since I talked to you last month. This shows that their popularity is spreading in all directions.

Whenever you hear complaints that the bells ring only part of the time, you can make up your mind that the line needs condensers. They will cure this trouble every time. They are so inexpensive and so practical that it is no wonder up-to-date Telephone Systems are adopting them everywhere.

IF YOU HAVE RINGING TROUBLES, TRY CONDENSERS

Don't waste time and money repairing ringers. Don't put it off. DO IT NOW.
You can have one line completely equipped on trial and return them at the end of 30 days at our expense.
WRITE US ABOUT IT TO-DAY!

"It might interest you

to know that the total maintenance expense of parts for our entire plant of 3,000 switches for the past eighteen months has been $10.24," writes Supt. J. A. Duncan, of the Sioux City Telephone Company, Sioux City, Iowa. (This company operates our AUTOMATIC TELEPHONE SYSTEM.)

"A like sum

would perhaps take care of the repair cost on operators' chairs in a manual exchange of the same size," adds Mr. Duncan. (We'll be glad to send you a copy of his letter if you'd like to see it.)

It occurs to us

that the one item of switchboard cords alone for a manual exchange of 3,000 lines would amount to at least $150 in eighteen months. That is fifteen times the cost of all repair parts on the Sioux City automatic exchange.

That is only one

of the many economies of the AUTOMATIC SYSTEM. These economies all help to swell the profits. And—the AUTOMATIC, being the best service, commands the highest rates. Low production cost plus high selling price equals big dividends. That is what led to the adoption of the AUTOMATIC TELEPHONE SYSTEM in the following cities:

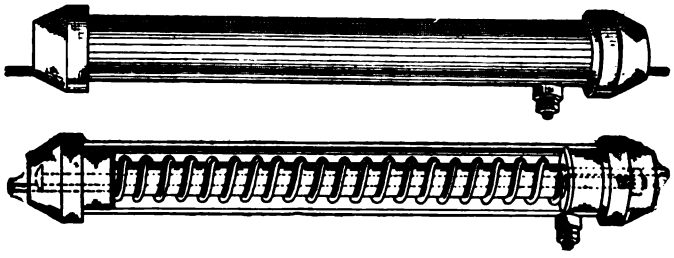
SKY ROCKET ARRESTER

The Flash of Lightning Goes



Always Sure, Safe and Simple

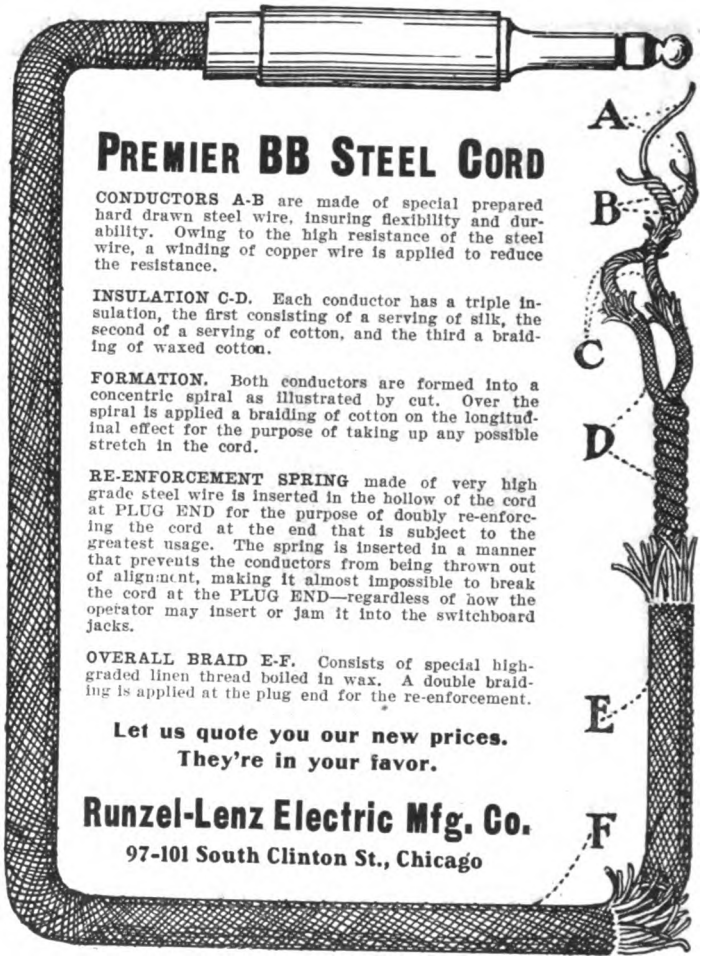
The coiled conductor within the grounded cylinder presents a continuous discharge surface of fifty inches. Lightning will not follow such a succession of coils owing to the opposing electromotive force or resistance set up.

Thus it will discharge to ground and does not reach the instrument or switchboard drop.

Will save their cost many times in a year.

WRITE FOR A SAMPLE TO-DAY. IT WILL PAY YOU.

CHANCE MANUFACTURING CO.
CENTRALIA, MO.



PREMIER BB STEEL CORD

CONDUCTORS A-B are made of special prepared hard drawn steel wire, insuring flexibility and durability. Owing to the high resistance of the steel wire, a winding of copper wire is applied to reduce the resistance.

INSULATION C-D. Each conductor has a triple insulation, the first consisting of a serving of silk, the second of a serving of cotton, and the third a braiding of waxed cotton.

FORMATION. Both conductors are formed into a concentric spiral as illustrated by cut. Over the spiral is applied a braiding of cotton on the longitudinal effect for the purpose of taking up any possible stretch in the cord.

RE-ENFORCEMENT SPRING made of very high grade steel wire is inserted in the hollow of the cord at PLUG END for the purpose of doubly re-enforcing the cord at the end that is subject to the greatest usage. The spring is inserted in a manner that prevents the conductors from being thrown out of alignment, making it almost impossible to break the cord at the PLUG END—regardless of how the operator may insert or jam it into the switchboard jacks.

OVERALL BRAID E-F. Consists of special high-graded linen thread boiled in wax. A double braiding is applied at the plug end for the re-enforcement.

Let us quote you our new prices.
They're in your favor.

Runzel-Lenz Electric Mfg. Co.
97-101 South Clinton St., Chicago

Overtime Losses Eliminated

By the old "clock and pencil" method of timing toll messages, the operator is usually prone to favor the patron by checking the call at the minimum time allowance, entirely neglecting "excess time." This is particularly true in cases where she knows the patron; thus showing an unfair discrimination between patrons, that in the course of a year results in large losses to the telephone company.

CALCULAGRAPH

Records being made automatically in a purely mechanical manner, register every second of the call and thus assure the fullest returns from toll lines.

It makes no clerical errors.

Managing a Telephone Company's Supply Department*

By M. R. Tracy, Storekeeper for the Toledo Home Tel. Co., Toledo, O.

LET us start a cable splicer out with a set of tools; everything from a cable saw to a covered cart with a lock on the cover and a chain to lock it to a pole at night. The splicer decides what articles he needs, and then he signs a stock order for the tools, naming every one. A duplicate of such an order is reproduced in Fig. 10, on the following page. The tools are taken from stock, or purchased if necessary, and delivered to the man on this order. On the fifteenth of each month he files a list of his "belongings" with the storekeeper, using the form shown in Fig. 11. This report gives all necessary data for completely accounting for all of the company's property, so that any discrepancy between reports can very readily be traced out. It fixes the responsibility definitely, so that there can be no question as to the amount of material each man should have. In order to see that this report covers all the new material issued during the month, each man's orders for tools are kept in a file, the names of the men being kept alphabetically. When he files his monthly statement it is compared with the stock orders he signed for tools during the month, and if the statement is found correct the stock orders are destroyed. If not correct, the man has to make it right. Broken tools are replaced with new ones if the pieces are turned in.

This system seems to admirably satisfy the requirements of the storekeeper, whose first object is to account for all material which the company owns. It is not hard to see how it has a tendency to do more than this, however. If one recalls the frequency with which tools get misplaced under the ordinary plan, which does not involve any particular strictness in accounting once they are in a man's possession, he will grasp the point. Where men are working together the company's tools are altogether too often treated as common property, which anyone may use, but for which no one is responsible. Borrowing is common enough, but there is no particular reason for returning an article as soon as the user has finished with it. The result is that tools often become separated from the original holder, through repeated borrowing, and if finally lost it is worse than useless to attempt to trace their career or charge their cost to any particular person. The simple plan of using the two forms referred to, and insisting upon their being properly filled out, does away with all annoyance and risk of loss by

C. Splicer FOREMAN

Fig. 10. Stock order for outfit of tools to be furnished to cable splicer by company.

It is well known to every telephone man that the storekeeper's department has to carry a supply of very small articles for repairing delicate parts of telephones, switchboards and private branch exchanges. These range in price from one-tenth of a cent up, and in size anywhere down to that of the head of a pin. The small cabinet described in the first number of this article furnishes a convenient place to keep them, but to account for them is another matter.

They are known to each repair man by a different name, and used so infrequently that the storekeeper forgets this time what name he gave them last time, and is receiving them under one name and issuing them under another name. He becomes confused in the price and lost in the count. He cannot even depend upon the original invoice for standard names, because they are billed by factory number, as "piece, No. 1586." Just to show what has to be done along this line the writer furnishes in Fig. 12 a copy of a regular invoice of small material. In Fig. 15 are shown the several classes of articles mentioned in the invoice. Now let the reader go ahead and try to identify the pieces in the cut with the articles named in the invoice.

Form No. 35.

NOTE.—When Tools are Transferred, you must have the Signature of the Party Receiving them (in the Column for Signature of "Person Receiving") or you will get no Credit.

File This Report the last of each Month with the Storekeeper.

E. L. CLINE, MANAGER.

Fig. 11. Head and foot of form for list of tools, to be made out to date and filed each month.

These are some of the puzzles confronting the storekeeper, and they cannot be neglected if he expects to balance his account with the auditor. The invoice of which a part is shown here covered several pages, and amounts to over $250. It is charged to the warehouse, and the warehouse must get credit for the goods, or be short.

The writer likes an "Incidental" card (Fig. 13). When he "O. K.'s" this invoice he at once charges the amount of the invoice to its appropriate account, according as it is found upon inspection that certain items were bought to repair switchboard

Making History in the Northwest*

By Francis Dagger.

LAST year with that generosity and spirit of fraternity which characterizes the American nation, you made a new record by amending the title of your association in order that Canadians might be included in its membership. This year you have rendered the occasion conspicuous by including in your programme for the first time an address dealing with events beyond the limits of your great Republic and in the vast Dominion to the north of you.

In order that you may the better understand that great territory which has for the past year been attracting so much attention in the telephone world and the most important part of which has recently formed the arena of one of the greatest contests between the "Bell" monopoly and the people, I propose giving you a few figures which indicate its great financial and commercial development.

In Manitoba, the premier province of this great northwest, last year sixty-one and a quarter million bushels of wheat was produced on three and a quarter million acres of land, by forty-five thousand prosperous farmers. The province has still twenty million acres of virgin prairie open for settlement, capable of producing four hundred million bushels of wheat per annum.

During the last five years the fifteen largest towns which lie between Lake Superior and the Rocky Mountains have increased in population 139 per cent, twenty-six towns of from 1,000 to 3,000 inhabitants have increased 96 per cent, and twenty-nine towns of from 450 to 1,000 people have increased 65 per cent.

Tax assessments have grown from $36,000 to $139,000 per annum. Branch banks have increased from 131 to 472, while the bank clearings in Winnipeg have advanced from $107,000,000 to $504,500,000. The foreign trade of the Northwest increased from $20,750,000 to $55,500,000; the exports last year in horses, cattle, sheep, furs, hides, wool, oats, wheat, flour, oatmeal and wood pulp amounting to $63,000,000, of which the United States took $12,000,000. The area of field crops in 1900 was 3,700,000 acres, last year 9,400,000, of which 4,800,000 acres are in Manitoba. Last year there were 1,592 elevators, with a capacity of 65,093,000 bushels, and 52 flour mills capable of turning out 25,000 barrels a day. From 1901 to last year 709,000 emigrants entered the Dominion, 239,000 coming from the United States, the majority of which settled in the Northwest.

It became necessary for the Manitoba government, in 1904, to consider the question of enabling the citizens to perform for themselves that which the monopoly had hitherto refused to do. As an evidence of the failure of the Bell company to live up to its responsibilities, it may be stated that at the beginning of 1905, after 24 years undisputed possession of the field, the monopoly had in Manitoba 5,532 telephones, in Alberta 730 and in Saskatchewan 442. Moreover, if the telephones in the capital of each province are neglected, the figures would be, in Manitoba 1,411, in Alberta 270 and in Saskatchewan 174. This, in a community of 800,000 people, one telephone to over 119 inhabitants, including the capitals of Winnipeg, Regina and Calgary, and one telephone to over 369 persons outside of these cities.

The provincial government appointed a committee of the legislature to inquire into telephone conditions elsewhere, and this committee, after securing all available information at home, visited the United States and held investigations in Minneapolis, St. Paul, Chicago and Grand Rapids, Mich., returning to Winnipeg firmly convinced that what had been accomplished by the Independents in your Union could with equal success be achieved by the people of Manitoba.

It was, however, decided that in order to completely cover the whole province, and more particularly the rural districts, with a properly equipped standard service within a reasonable time, that it was absolutely necessary that such means should be adopted as would secure the requisite capital without difficulty, and at a low rate of interest, which was only possible under public ownership. Certain necessary legislation was, therefore, introduced by the attorney general, the Hon. Colin H. Campbell, and passed by the legislature without dissent.

It was provided that a poll be taken at the municipal elections on December 18 last, in which every rate payer in the province was given the opportunity of voting upon the question, "Shall this municipality own and operate its own telephone." A vote in the affirmative gave the council power, subject to the government's approval, to proceed with the work and obtain the necessary capital for construction and extensions from time to time, without any necessity of issuing further by-laws, thereby rendering it impossible for the Bell at any time to harass a municipality in its fianancing, by influencing the electorate to vote against the issuing of bonds to take care of future growth.

Preparatory to the taking of this vote the government called upon the writer to conduct a campaign, which, from the number of meetings held, territory covered, literature distributed and unanimity of the verdict recorded against the Bell monopoly, is without a parallel in the history of the telephone fight on this continent. In this work loyal support was given by a corps of representative Independent telephone men from both Canada and the United States.

At the time of taking this vote there were in Manitoba 124 municipalities, in which the Bell had 49 exchanges. Those municipalities voting against the continuance of the monopoly represented 36 Bell exchanges and 9,000 subscribers (including Winnipeg, where the majority was 3 to 1), while those voting against the government's policy represented 13 Bell exchanges and 498 subscribers.

The Government of Manitoba is now preparing to build a complete system of toll lines, comprising approximately 1,500 miles of pole route, to connect the various local exchanges with Winnipeg, just as soon as the municipalities have their systems installed. The government long distance system will connect with the lines of the Tri-State company of Minneapolis, and thus form a link with the Canadian Northwest and the Independent companies in the United States.

The government is also making arrangements to commence the construction of a plant in the city of Winnipeg for 10,000 telephones, with an ultimate capacity of 20,000; also one in Brandon for 1,000 telephones, with an ultimate capacity of 5,000; the councils of both these cities having, by resolution, requested the government to provide these services. Portage La Prairie has not yet made any decision, but the legislature provides that the government will establish a local service in that city, and in all other municipalities in which the telephone by-law did not carry, upon the request of a reasonable number of rate payers. In this way there will be no missing links to the provincial system when it has been completed.

In regard to the municipal town and rural systems, already a number of municipalities are being canvassed for subscribers, and the results to date are most encouraging. In the first municipality canvassed, out of 450 farms, 300 signed contracts at $15 per annum have been obtained before a single pole has been ordered. In the two neighboring municipalities almost the same proportion of subscribers had been secured. It appears reasonable to prophesy that three years hence there will not be less than 50,000 telephones in Manitoba, connecting with the provincial long distance lines, instead of the 5,500, which the Bell had when the government inaugurated its present policy.

In Alberta the provincial government has adopted a policy similar to that of Manitoba, and has already completed some hundred miles of toll lines, including one between Calgary and Banff, 82 miles. Calgary recently passed, by a large majority, a by-law voting $120,000 to build and operate a municipal sys-

*Abstract from an address at the Chicago convention, June 6, 1907.

Digitized by Google

tem in that city. Edmonton has been operating a municipal service for two years, and will install an automatic system of 2,000 telephones. The smaller towns and rural districts in this province will have either municipal or government systems.

In Saskatchewan, the neighbor province of Manitoba, the legislature this year voted $6,000 for preliminary work in regard to telephones, with a view to following the example of Manitoba and Alberta. East of Manitoba to the lakes there are only three cities of importance, viz., Kenora, Fort William and Port Arthur, and each of these municipalities owns and operates its telephone system, there being in the last two cities 1,800 municipal telephones, as compared with 200 Bell subscribers.

Five years hence there is little doubt that there will be a complete and modern service with a telephone in every farmhouse, having local and long distance connection with every village, town and city in the West, and with the Independent systems in the adjoining states over the border as far as the art of telephony will permit conversation.

Long Distance Service*

Its Development and Possibilities

By C. E. Tarte.

NOAH seems to have been the original traffic manager, and I think sent and received a reply to the first long distance message on record. Twice he had to say to his subscribers, "No circuit," but finally the line was clear, the message sent, and the answer brought good tidings of dry land, sunny days and a promise of that development of the human race which has continued to the present time, and which we trust will continue for centuries to come. From then until quite recently long distance development was slow and unsatisfactory, but the last ten years have shown a growth so rapid that it is astounding; what the next ten years will bring forth no one dares to prophesy.

All great movements have in them certain elements of combined strength and weakness. The strength and weakness of the Independent telephone movement lie in the fact that it represents so many and such diversified interests. Coming as we do from every State in the Union, with stockholders living in every county and almost every city and town in these States, we represent people of all classes and come nearer representing the entire people than any other convention held in this broad land of ours, with the exception, possibly, of the conventions of the great political parties. This is our strength. Each company managed by its local board of directors through its secretary, general manager, general superintendent, or whatever you may wish to call him, has ideas of its own, some good, some bad, some indifferent; but always in close touch with local people, knowing their habits, their needs, their conditions, we are better able to give satisfactory local exchange and "short haul" long distance service than companies managed and owned by directors and stockholders hundreds of miles away.

Long distance service, however, under this kind of management, is not necessarily satisfactory. If Johnson in Illinois wishes to talk with Jones in Ohio, or Morgan in Missouri, he must, to get good results, talk over lines operated under the same schedule of rates, the same time limits for conversation, the same code between operators, and in general terms built of the same class of construction and with about the same apparatus; and the companies handling his business must be assured that when his message is completed they will each get their share of the "haul."

We cannot expect to hold the business of the large manufacturer who wishes to talk with Pittsburg, Cleveland, St. Louis, Kansas City, Minneapolis, Dayton or Oshkosh unless we can give prompt and satisfactory service. If he uses our competitor's lines for the "long haul" he is likely to do the same for the "short haul." It is not claimed that this "long haul" long distance service is the most valuable or necessary part of our business—it is not by any means; but at the present time it is what we lack the most in the way of giving complete service to our subscribers.

"Short haul" long distance messages are, and I believe always will be, a most important factor in the building up of our business and earning profits for our stockholders. Ninety per cent at least of so-called long distance messages go to points within fifty miles of the originating station. There seems to be no limit to business of this character, except probably the limit to the number of circuits. Time and again I have seen new circuits built for the purpose of relieving congested lines, and the result is simply enough more business to make the new line as busy as the old one. Of course there is a limit to this, but few of us have reached it. In communities where there are enough circuits to take care of the 10 cent and 15 cent messages as fast as they are sent in it will be found that the telephone has practically superseded the mail as a medium for carrying on business.

The merchant, the manufacturer, the produce dealer cannot waste his time and the time of his clerks and stenographers writing letters and waiting for replies when for ten or fifteen cents and but little more time consumed than in getting a local subscriber he can get in touch with the party wanted from ten to twenty-five miles away. Build more lines of this kind. Copper is high, we all realize that, but with pole leads already up new lines can be built at comparatively low cost, and the investment will bring in surprising returns.

Trunk lines between the large commercial centers should be built at once; this matter is so essential to the success of the Independent movement that every effort should be made toward development along these lines without any further delay. A careful study of the map of the United States will show that the territory east of Kansas City almost to the Atlantic ocean is so filled with Independent exchanges and long distance lines that it is not going to be much of a problem to fill in the necessary gaps and make a long distance system so complete and comprehensive as to be astounding. When this is done our competitors are going to have a hard time stirring up trouble like they threatened in Indiana a short time ago.

You will find that in nine cases out of ten the Bell company induces local exchange companies either to connect with its lines or to become sub-licensees because the local company does not have enough long distance lines to take care of the business properly, and they think when they connect with the Bell their troubles will be over, but the awakening is generally a sad one. They find that while they are able, possibly, to talk with points five or six hundred miles away better than they were over the Independent lines, that to points in their own State they are more often worse off than they were before. I will venture to say that in the States of Michigan, Indiana and Ohio, and I presume in most of the other States, that service to points where from ninety to ninety-five per cent of the business is done can be secured with more satisfaction over the lines of the Independent companies than over the Bell, and yet their strongest talking point is what they call their "superior long distance service." Why? Because as stated before they undoubtedly beat us out in giving service to points five or six hundred miles away, and while only a few of the subscribers to any exchange talk with these far away points it still makes a drawing card and they use it for all it is worth.

Before any larger development can be made traffic associations

*Abstract from an address delivered at the International Convention, June 5, 1907.

Digitized by Google

and clearing houses must be thoroughly organized. Neither companies nor individuals will put their money into lines unless they have positive assurance that they will have their share of the collections for all business going over them. This seems such a reasonable and sane proposition that it is almost absurd to make the statement; and yet the lack of appreciation of it is holding back Independent long distance development more than any other factor. As a general proposition each State should have its own traffic association and through the clearing house of this association all business inside the State should be handled. This State association should then be affiliated through its officers with the traffic associations of neighboring States, with which it does most of its business, and these interstate associations should then through their officers again form a national traffic association.

Operating rules, codes, time limits, rates (outside of those purely local in each State) and all methods of handling long distance business, etc., would be handled through these associations, and we would then have an organization stronger by far than if we were all in one large company, and still retain the strength that comes with local organizations, local directors and local stockholders.

Where the Copper Comes From—Montana*

By J. S. Haley.

IN the extent and magnitude of her mineral resources Montana stands pre-eminent and alone. First in value and importance of her mineral products is copper, for Montana is truly the state where the copper comes from, and while your finance committees are preparing the budget to take care of the extensions of your lines, or improvements of your great telephone plants and wondering how much advance they will have to pay for the next car of copper wire, the millionaire mine owner of Montana is resting secure in the fact that he practically holds the key to the situation. He knows that the great telephone development that is taking place will add yearly to his boundless wealth and the wealth of the great state of Montana—where the copper comes from.

In Montana we Independents are as yet in our infancy, but in the brief span of time feel that wonders have been accomplished. Telephone competition is new in this territory. The pioneer in the Independent telephone development in the state of Montana is P. B. Moss, the noted banker and financier of Billings, who for several years has owned and operated with great success the Mutual Telephone Company's plants in eastern Montana. The territory served by this company has every reason to be proud of the splendid service afforded, and the public has shown its appreciation by patronage far in excess of that awarded his Bell competitor. In the territory which it covers this company has practically double the number of patrons served by its competitor.

Next come the Home telephone plants, which have all been constructed and put in operation during the past year, in the territory directly west of that occupied by the Mutual company. These plants have all begun giving service during the earlier part of this year, and in point of number of subscribers and extent of service have surpassed all that has been accomplished in the past ten years in this field by the Bell companies. Directly west of these, in the territory of Butte and Helena, plants are now being built by the Montana Independent Telephone Company. Great progress has been made towards completion, and it is safe to say that during the next year there will be spent in this territory, by these various companies, approximately three million dollars in development work. All plants that are now in operation are connected up with the best of copper toll lines; the construction throughout is standard; and with the completion of lines now being built Montana will take a front rank among the Independent telephone states.

Independent telephony in Montana owes much to the efforts of W. H. Crumb & Co., of Chicago, through whose perseverance and labor a decision was secured from the Supreme Court of Montana whereby any telephone or telegraph company is permitted to construct its lines in the towns and cities of the state. The sum total of the situation is that the territory is divided into three sections, each covered by allied companies—the Mutual Telephone Company on the east, the Home Telephone Companies in the central and the Montana Independent Company on the west. All of these companies connect for the interchange of busines and form a most complete state system.

Taken as a whole the field has proven a fruitful one. The rates are adequate, making a satisfactory investment. In no case has there been any question of getting the business, but only the proposition of being able to supply the demand for service.

*Abstract from an address at the International Convention, June 5, 1907.

The Missouri Convention

MISSOURI Independents met at Kansas City early in May in convention, which was generally agreed to be the best attended and most interesting meeting which has ever been held in the State. Representatives of both large and small companies from all parts of Missouri were present, and also leading telephone men from the neighboring States of Kansas, Nebraska and Iowa. President W. B. Scruggs, of Springfield, called the convention to order and introduced Mayor Beardsley, who gave an address of welcome worded in an especially happy vein. He said, among other things, that the Independents have, from a very small beginning, carried development work so far that there was no predicting where they would stop, the problem of running a line to the planet Mars even being a possibility of the future. He spoke of their success as coming from a recognition of the value of giving good service and friendly treatment in all cases to their patrons.

Mr. Theodore Gary, of Macon, in his address to the meeting spoke of the attacks from newspapers and the acts of the legislature as showing that the people in general do not understand the telephone business. Perhaps some of the operators themselves are not well enough posted, as many of them have involved themselves in embarrassing situations through not admitting to themselves the true extent of depreciation in their plants, and advantage of this has been taken to create a certain amount of sentiment against them. The work of the association, he said, is probably best designated by the term "education." He referred to the value of telephone organizations, citing the associations in Indiana, Ohio and eastern Illinois as examples in which not only the general organization but district organizations are strong, holding five or six meetings a year, with one or two regular meetings and occasional special gatherings of the State associations, traveling secretaries being employed to keep all members in touch with one another. He closed his address with an appeal for charitable and friendly relations with all telephone men, saying that even those who have been misled into connection with opposition companies should be made welcome by Independent men, and they will gradually, as they learn more of the Independent business, see their own mistakes.

Digitized by Google

President Scruggs in his address referred in the most favorable way to the efforts which the mutual and farmers companies are making toward the building up of the telephone business in rural districts, and spoke of them as natural allies to the Independent movement, saying that he proposed to take the position that they "are a benefit and absolute necessity to the success of the Independents, and that they have helped them to win the great fight." Referring directly to the work of the association, he spoke of the advantages which are to be gained if each member will do his own part cheerfully, promptly paying his dues at the proper time, taking care to attend every district and State meeting which he can possibly reach and performing such duties connected with his membership as he may be called upon to do.

When O. C. Snider, general manager of the Home Telephone Company, of Kansas City, first addressed the convention he brought to its attention the bill concerning long distance telephone rates which was before the Missouri legislature, and presented the following resolution:

WHEREAS, The Missouri House of Representatives on the 7th day of May, 1907, passed a bill fixing long distance telephone rates; and

WHEREAS, The rates named in said bill are an average reduction of about thirty per cent. on the present established rates; and

WHEREAS, Said bill is now pending in the State Senate; therefore, be it *Resolved*, By the Missouri Independent Telephone Association, in annual convention assembled:

1. The rates for long distance telephone service have been reduced by competition during the past few years to such an extent that there is now but a small margin of profit in the business.

2. If said bill is enacted into a law its effect will be not only to deprive the owners of toll lines of all profit whatever, but will inflict serious and irreparable loss. That it will stop further telephone development, impair the present service, and result in great injustice to thousands of citizens of our state who now have their money invested in telephone property.

3. This association, representing more than four hundred separate companies located in all parts of Missouri, and representing millions of dollars of investment of citizens of Missouri, earnestly protest against this measure, and call on our senators to defeat its passage.

The president appointed Mr. Snider and Mr. Hudson to see that each member of the committee on private corporations in the legislature receive a copy of the resolution.

F. G. Taggart, of Richmond, moved that a committee be appointed to revise the constitution and by-laws, and after the motion had been carried he was appointed to the committee, accompanied by Mr. Gary and Mr. Golladay, to carry out the work.

W. H. Bassett, of St. Louis, gave an interesting talk on Independent long distance companies and their co-operation with local companies which was very useful to the members.

Houck McHenry next spoke of telephone laws in Missouri, stating that at present and in the immediate future, as far as can be seen, there is absolutely no occasion for the passage of laws regulating the telephone business—regulation as exemplified in most of the bills which have been introduced during the present session would mean confiscation. These bills have been introduced mainly through a lack of knowledge on the part of the public of the characteristic features of the telephone business, as the majority of people are not aware that the profits do not increase in the same ratio as the growth, but that on the contrary the reverse is true. The average man is open to conviction, and it is the duty of the telephone man to educate the people and convince them that the telephone business is deserving of careful consideration before any legislative measures relating to it are adopted.

In speaking of taxation on telephone properties, Mr. J. A. Hudson referred humorously to the difficulties he had experienced in making out some of the state reports, and suggested that some modification might well be made which would do away with troubles such as he had met. W. B. Bentley, traffic manager of the Home Telephone Company, of Kansas City, summed up the essential features of local telephone operating for securing good service in an exceptionally clear and concise manner. At the close of his discussion the president appointed as a nominating committee Mr. Snider, Mr. Gary, Mr. Thompson and Mr. Bassett. After this the secretary read senate bill No. 23, which gives to cities throughout the state the power to regulate telephone charges, for the information of those members who were not familiar with the measure.

When called upon for a general talk on the telephone business S. S. Lichty, of Vinton, Ia., called upon his wide experience for a considerable number of details about the Independent movement, which were received with much interest by the members He referred especially to the benefits of organization to the small operators, and to the advantages to the other companies which come from interesting these people in the Independent movement.

Mr. Gary, in a brief address, traced the history of the International Association, and described some of the important work which it is doing for the assistance of the Independent companies throughout the country.

For the past two months the association has employed Mr. F. G. Taggart to visit exchanges throughout the State and assist in the work of organization, etc. His experiences formed the basis of one of the best talks given at the convention. He referred to the difficulties of interesting Mutual telephone operators in convention work, but at the same time stated that he found many of them were anxious to improve the service of their systems and put them on a better paying basis, and would be glad to associate themselves more closely with the Independents. There are some sections of the State where all that is needed to put the organization on the firmest basis is the building of toll lines, which will unite the plants more closely from an operating standpoint. Independent local plants are well developed and well managed.

Greetings to the members of the association were brought by R. E. Mattison, secretary of the Nebraska Association, and Mr. W. H. Nelson, president of the Kansas Association, as well as traveling Secretary Zimmerman, of the Kansas Association. All of these gentlemen told the Missouri Independents of the principal features of the work which they are doing in their own States, and discussed features in which all telephone men are interested together. Their remarks were received with the closest attention and interest by the Missouri members. Just before the report of the nominating committee was made an interesting talk upon Mutual business was given by George C. Campbell, of Bower Mills. The members moved to hold the next meeting in Kansas City, and then proceeded to approve the report of the committee on nominations, who presented the following names for officers:

President, Houck McHenry, Jefferson City, Mo.; secretary and treasurer, G. W. Schweer, Windsor, Mo.; delegates to national convention, Houck McHenry, Jefferson City, Mo.; M. L. Golladay, Holden, Mo.; H. L. Reber, St. Louis, Mo.; Judge J. F. Davidson, Hannibal, Mo.; Dr. S. T. Neill, Clinton, Mo. Alternates—A. T. Adams, Tipton, Mo.; Ed Foote, Pleasant Hill, Mo.; H. D. Hibbeker, Washington, Mo.; J. F. Barnett, Rutledge, Mo.; B. E. Oeff, Warsaw, Mo. Registration committee, H. L. Gary, Macon, Mo.

The committee on the revision of the constitution and by-laws reported that revision was unnecessary, and their report was approved by the members.

After this business had been transacted there were a number of talks by different members concerning important questions which are now before the Missouri operators. Dr. Neill, of Clinton, presented a paper on the Taxation of Rural Lines which set forth a plan which many of the members thought would be very useful if it could be properly carried out. His paper, in part, read as follows:

"I would suggest that all telephone companies that occupy, or cross the county roads, should be compelled to incorporate under the state law, and before building should file a plan of their proposed route, giving a detailed statement of the size, kind and number of poles to be used and height at which the wire will be strung along such roadway and show where other existing lines will be crossed or paralleled; this map should be filed with the county clerk of the county and should be submitted to the county court with the request that the right to construct the proposed line be granted at the next term of the

Digitized by Google

court thirty days later. This will give ample time for any one likely to be injured or molested by the construction of a proposed line to appear before the court and object to the erection of the new line, and if in the judgment of the court the erection of the line will interfere with complainants' line, changes and alterations can be ordered made before an order is made to permit the construction to proceed.

"When the line is completed the officials of the company should file a full and complete report and map showing the number of poles used, miles of wire, number and kind of telephones, switchboard and equipment and cost of same, to be filed for a permanent record.

"Then we will have a complete record of each telephone company in the State and in each county, and can fix the tax rate on all equally. This plan looks simple in operation and sure in result; it certainly would assist the officials of each company who are called upon to make up the list and swear to it once each year."

At the close of the meeting Mr. Gary moved that the officers be instructed to invite all Mutual companies in the state to meet with the convention next year. The register showed that over two hundred and fifty members were present, and everyone expressed himself as more than pleased with the results of the Convention, and stated his readiness to carry on with all his power the work of developing and perfecting the organization throughout the state.

Telephone Legislation in Texas*

By J. B. Earle, Waco.

WITHOUT the matter having been discussed before the people or in any way agitated, some member of the Committee on Resolution and Platform at the Democratic state convention, which met in Dallas, Aug. 1906, introduced and had the committee accept a platform demand requiring all telephone and telegraph companies to connect. There was, however, more or less agitation on this subject in the papers after the convention adjourned. When the Texas legislature convened two or three bills were introduced affecting telephone properties, one of which required all telephone companies to connect with all other companies of every kind, competing exchanges, competing long distance lines and lines that were not competing. This measure was bitterly opposed by the Southwestern Telephone & Telegraph Company (Bell) as well as by the Independents; all companies preferring to be left alone to make their own contracts for connection.

The telephone companies were given ample time to discuss this matter before the Committee on Corporations and the result was the bill was killed in committee, but a substitute was reported by a majority of the committee, proposing to compel a connection between companies at common points for such business as originated at a point where only one company had an office and terminating at a point where only the other company had an office, that is, to take care of non-competitive business. Another bill was proposed and offered as a substitute for this allowing either company, if it so desired, to go into the district court and on the merits of the case have an order entered by the district judge setting forth whether or not a connection should be made and if so the terms and conditions. At the suggestion of the Independent Telephone Association of Texas, the following section was incorporated in this bill for the protection of the small companies and the prevention of discrimination on the part of the Bell:

"Sec. 10. The schedule of regular rates for long distance business in force by telephone and telegraph companies in this State on the 1st day of January, 1907, shall be, and is hereby made, the maximum rate to be charged by the respective companies hereafter for such or similar service. The rate for telephone companies shall be non-descriminating and it shall be unlawful for any telephone company to charge a higher rate for any form of local telephone service or long distance telephone service between diffrent persons in any one exchange, or between any two or more points on its long distance lines; and for local exchange service a company shall charge the same rate for substantially the same service in one town as charged by said company in another town, where the exchanges come within the same class as herein specified. Class No. 1 shall consist of telephone exchanges in which there are not more than five hundred telephones in operation in each said exchange; Class No. 2 shall consist of telephone exchanges in which there are not more than one thousand telephones in operation in each such exchange; Class No. 3 shall consist of telephone exchanges in which there are not more than three thousand telephones in operation in such exchange, and Class No. 4 shall consist of telephone exchanges in which there are three thousand or more telephones in operation in each exchange."

If the above bill had been enacted into a law their rates would necessarily be the same for the same character of service the State over. These bills were never reached at the regular session.

When the special session of the legislature was called this plank in the platform came in for mention by the Governor. A bill to meet the demand was passed by the Senate and sent to the House, and when the section quoted was offered as an amendment it would probably have carried, but was held not to be germane to the connection bill, the regulation of rates, etc., not being mentioned in the Governor's message, and was out of order.

This bill, as passed, provides that telephone and telegraph companies shall be compelled to make physical connection between their toll lines at common points for the transmission of messages or conversations from one line to another; such connections to be made between the switchboards of such companies, if any are maintained at such points, and provides "that no telephone or telegraph company, under the provisions of this Act, be compelled to receive from the lines or wires of any other company and carry to its final destination any message originating at any point on its own lines."

The bill also provides that this shall be done by order of the city council, in incorporated cities, and in the Commissioners Court at points where there is no city council. After an application has been made, if it shall determine upon final hearing that it would be for public convenience and justice to the telephone or telegraph companies to make such connection, whereupon they shall enter on record their findings and shall set out in their order the conditions upon which such arrangements of conversation shall be made.

The bill carries the emergency clause and went into effect on May 12, last.

I take it, under provisions of this bill, that a connection can be forced by one company upon another from a non-competitive point, but the attitude of the Bell telephone system toward the Independents in Texas, and that of the Independents toward the Bell system renders it very improbable that either company will ever make application for this connection. This kind of legislation is undemocratic, but having been placed in a Democratic platform had to be passed where the Democracy is as strong as it is in Texas.

There was another law placed upon the statute books during the last session of our legislature just adjourned, known as the Anti-Pass Bill, which applies to railroads, street cars, interurban, express and sleeping cars, telephone and telegraph companies, preventing discrimination at least in long distance service. Among other things this law provides in Section 4 that:

"No company subject to the provision of this act shall, directly or indirectly, by any special rate, rebate, drawback or other device or exchange demand, charge, collect or receive from any person, firm, association of persons or corporation a greater or less or different compensation for any service rendered or to be rendered, in the transportation of passengers, property or messages than it charges, demands, collects or receives from any other person, firm, association of persons or corporation for doing for

From the Editor's Viewpoint

KEEPING TRACK OF TELEPHONE MATERIAL.

WHEN the engineer, manager, construction foreman or any other employee of a telephone company stops to consider that every stroke of work he does involves the use of material furnished by the company he begins to realize how essential a matter it is that these goods should be handled by an efficient system. Good work in the storekeeper's department will do a great deal toward keeping the construction and auditing departments running smoothly, and turning out work on time. On the other hand, the storekeeper who fails to maintain the proper relation between his stock and his accounts is able to mix things up frightfully, as many telephone men have found out to their sorrow.

Mr. Tracy in his present serial article has set forth some of the methods which he has adopted for taking care of the material used by the Toledo Home Telephone Company. We understand that the results obtained by him in this work are considered by well informed telephone men to be exceptional, and we believe they are admirably set forth in his article. Still, there is a great deal more to be said on the same subject, and Mr. Tracy frankly states that one of his principal objects in publishing this article was to call forth friendly criticism from his colleagues in the same line of work, with a view to settling on the best methods of accomplishing certain results. If this is an invitation to correspond with THE AMERICAN TELEPHONE JOURNAL on this subject, we are glad to second it in our own name.

This field is open not only to men connected with the supply department, but with all other departments. Each one uses stock, and may at any time devise an improvement in methods of handling it or accounting for it. Who has some good ideas?

POKING UP THE DELINQUENTS.

ABOUT everyone who has participated in the recent state conventions of Independent telephone men, or in the big convention at Chicago which has just closed, is pretty keen on boosting the organization. The good men have got together and renewed their impressions of each others' worth, and found new evidences of the benefit which comes from co-operation with the other fellows in order to reap the advantages of the boosting which they are all doing in close combination. Aside from those who have been to the conventions there are a good many telephone men who for various reasons were unable to attend, and many of these are just as firm believers in the organization and just as enthusiastic workers for its success as those who went to Chicago. The International Association and many state organizations have been established on such a firm basis that their definite working plans are quite well known in every part of the country and their respective states, and the thing which is most necessary now is to have everyone in the business get to work on these plans.

It is not enough that a few men in each district should come out to a convention once a year and report progress. What is needed is for every man in a district to get together with his neighbors as often as possible and plan things, so that whatever work is being pushed forward for the common good will make steady, smooth and equal progress in all parts of the district.

The telephone association is not a social club, but a business organization. Now this ideal condition, where all telephone men work together on certain lines of common interest, can never be realized unless everyone who operates an Independent telephone system is interested in the work, and if anyone hangs back the very first thing for the active members to do is to wake him up. Let two or three good men make it their first duty to go after each delinquent and show him how he is going to lag behind in his own business by failing to keep in touch with the progressive plans in which the association leads.

It will be a good thing to outline for such a man the benefits derived from the association plans on both local and national scales. A person who has not been in close touch with the association's doings cannot be expected to appreciate their value. He needs education. If necessary, it would be worth while to get definite data and letters from telephone managers in several localities for use in such cases. There are plenty of managers who would be only too glad to help in such a movement by telling their experiences. The idea is to show how the closer association, made possible by regular meetings and a discussion of subjects of common interest, has made it possible for each member to keep in touch with the entire field of telephone operation, where his unaided efforts would only suffice to cover a portion of them. Then, too, in planning for extensions, getting toll line business, watching competitors and other affairs of this sort, there is the greatest advantage from the co-operation of neighbors. If those who take up the subject have for any considerable length of time been members of a district organization they will not lack for illustrations of its value among their own members, and these will furnish the most convincing proof to the person they wish to interest, and these examples from near home are the very best.

Just now it is not so important to get an early start on universal plans for trunk line building, map drawing, gathering of statistics and other things of this sort, as it is to fill up the many small gaps in the organization. If this could be done by vigorous work in, say for the sake of example, six months, how long would it take then to get a set of maps, figures, etc.? How long would it take for everyone to swing into line to push any new movement for the common good, if every operator were in close touch with and in full sympathy with his district organization? That is what brings business and power to both big and small companies in well organized states like Ohio, Indiana and Iowa.

Think this over if you are an association worker, and get after your neighbor who is not, and do not stop until you bring him in. If, on the other hand, you are one of the fellows who have never done much to promote association work, this is the best time to start. You will probably want to share in the benefits of this work many times in the year. Give yourself an opportunity!

GOOD WORK OF THE FINANCE COMMITTEE.

ONE of the most pleasing and gratifying features of the recent convention at Chicago was the good work of the Finance Committee in raising a special fund to relieve the association of a deficit, and the prompt response which the committee met from persons called upon for aid. It was found that at the time of the convention the association, on account of the large amount of work which had been recently carried on, found itself facing a deficit. To relieve this situation, in order that the association might start the coming year free from debt, a finance committee was appointed, with the following members: Ed. L. Barber, of Wauseon, O., chairman; Charles Y. McVey, Cleveland, O., vice-chairman; W. B. Woodbury, Detroit, secretary and treasurer; H. B. McMeal, Telephony Publishing Company; W. H. McDonough, AMERICAN TELEPHONE JOURNAL; J. G. Ihmsen, American Electric Telephone Company, and W. E. Doolittle, Sterling Electric Company.

They went to work so vigorously upon the task which had been set them that not only was the deficit very promptly cleared, but a considerable additional sum was raised, so that the association had, as the result of their efforts, a very substantial amount to its credit to start the coming year's work. This was raised through the direct contributions of leading operating companies and officials, manufacturing houses and publishers of telephone papers. The committee is to be congratulated upon the good progress made, and the association is likewise to be congratulated upon having members and friends who will meet an emergency like this so promptly and willingly as did those who responded to the call of this committee.

Legal Snares Untangled

CONDUCTED BY A. H. McMILLAN.

PERMISSION TO CONSTRUCT LINE BINDING THOUGH GIVEN BY OWNER'S AGENT.

Thirteen years ago this spring A rented a farm of B, paying money rental, A to look after things just as if the farm was his. This A did, paying the taxes, making repairs and charging them to B when it was for him to pay. During this time A with other neighbors became interested in a mutual telegraph line, setting poles along the highway of B's farm. This line was soon changed to a telephone line.

Two years ago it was incorporated and part of it repoled.

During this term of years B visited the farm once in a while. At no time was there a word of fault found with A, or anything that he did.

This spring B has sold the place to C. C has ordered the poles removed from the highway.

What are the rights of the telephone company? F. W. H.

IN the case you state, A was agent as well as tenant for B and in accordance with the principles of the law of agency, the principal in this case was bound by the actions of the agent. The authority given the agent "to look after things just as though the farm was his" was ample enough in itself to authorize him to give a license to the telephone company, but more than this, the principal B practically ratified his agent's conduct in visiting the farm and finding no fault with the existence of the poles along the highway. The fact that the line was changed from telegraph to telephone and from a mutual to an incorporated company is not material.

PAINTING POLES—HOUSE MOVING.

Please advise me through the Law Column of your paper the following:

The city council here passed an ordinance requiring all telephone companies within the corporation line to paint their poles, i. e., all that is above ground, two coats of white paint and the cross arms two coats of red paint. When we were granted a franchise there was nothing in it about us painting poles. Can they compel us to paint all poles within the limit they specified in the ordinance?

A contractor is moving a two story house in the country and in so moving it is necessary for us to take our wires down. At one place where he crosses us our poles are 30 ft. high, and on a corner we will be compelled to take our guy wire down and also put fixtures on the poles in order for him to pass under. We have already gone to a lot of expense for him in changing our wires. We ask him to pay the expense, he refuses; can we compel him to pay it? M. J. C.

THE city has the right to regulate poles and wires in its limits independent of whether it has reserved that right in its franchise. It can require you as a police measure to paint your poles within the limits specified in your franchise.

Moving houses is not a use for which the highway is intended, so that a telephone company can compel a house mover to pay the expenses of taking its wires down to permit him to cross its line. Northwestern Telephone Exchange vs. Anderson, 98 N. W. 706.

CONTRACTS FOR TELEPHONE RENTAL HELD BINDING.

AT Watertown, New York, two interesting cases were recently decided involving the binding character of contracts for telephone rental. One case was a suit brought by the Citizens' Telephone Company vs. Edward Farrell for telephone rental of $16.50. The company had allowed him three months' free service, dating the contract three months ahead, as was the custom of both companies in the city at that time. After three or four months he went to work for the Bell company and wanted to take out the Citizens' telephone, ignoring his contract. When the company brought suit the defendant claimed that the telephone was put in for three months on trial, but this was not proven, and the company was allowed the full amount of its claim.

In the other case, which was even more interesting, the party signed a contract for one year which read, "For one year and thereafter until one month's notice from either party." Afterwards the other company offered him free service, so he decided to take out the Citizens' telephone in defiance of his contract. The court sustained the validity of this contract and compelled the subscriber to pay the rental in spite of the fact that the company was disabled, by the subscriber's action, from furnishing service.

POLES WHICH DO NOT FORM AN OBSTRUCTION CANNOT BE REMOVED FROM THE STREETS.

THE United States Court at Mobile, Alabama, has decided the case of the Southern Bell Telephone Company against the city favorably to the defendant. The suit was brought to restrain the city from cutting down certain telephone poles.

The court holds that the poles in question are not erected in violation of the city ordinances, but under the contracts granted to the company in certain city ordinances, and therefore are not under the police regulation of the city, as they do not form an obstruction to the streets. The Court says: "My opinion is that the defendants cannot be permitted to oust the complainant from possession and use of its poles by cutting and removing them from their places on the streets without due process of law. An injunction will be granted to restrain a party from deciding for himself a question involving controverted rights, and compel him to resort to the courts, and this without regard to the absolute merits of the controversy. It is enough that there is such controversy to justify the interference of a court of equity. The motion to dismiss the bill for want of equity is denied, the demurrer to the bill is overruled and an injunction *pendente lite* is granted as prayed for."

ORGANIZING A RURAL TELEPHONE COMPANY.

You will greatly oblige a number of farmers in this locality by giving a brief statement of the laws concerning rural telephone lines.

Is it necessary to secure a charter? If some landholder is cranky or stubborn and forbids building a line along the road by his farm, what can be done under such circumstances? How far from the middle of the road should the poles be set? What form of organization and agreement would be best to follow? E. B.

IN general it is better that those who erect rural telephone lines incorporate under the laws of the State. Such incorporation obviates the liability to many complications that may arise under a partnership arrangement. Further, the laws conferring rights needed in erecting and maintaining the line are drawn with reference to incorporated companies, and, while these rights might be held as pertaining to individuals or partnerships engaged in such enterprises, the intent was clearly to confer them upon incorporated companies. For the laws governing the formation and management of corporations, see Chapter 23 of the Revised Statutes of 1905. Blank forms may be obtained on application to the Secretary of State, Topeka, Kan.

Telephone companies are given the rights and powers conferred, and are subject to the liabilities and duties imposed by the general laws of this State upon telegraph companies. (See Sections 1323, 1324, General Statutes of 1905.)

"Corporations created for the purpose of constructing and maintaining magnetic telegraph lines are authorized to set their poles, piers, abutments, wires and other fixtures along, upon and across any of the public roads, streets and waters of this State, in such manner as not to incommode the public in the use of such roads, streets and waters." (General Statutes, 1905, Section 1408.)

Such companies are also given very wide authority as to privately owned lands, and may condemn rights of way over them.

As construed by the courts, there is little legal restriction as to where the poles shall be set along the highway. In exercising its powers, the corporation should have due regard not only for the convenience of the public, but also for the convenience of the abutting land owners, and for the appearance of the landscape.

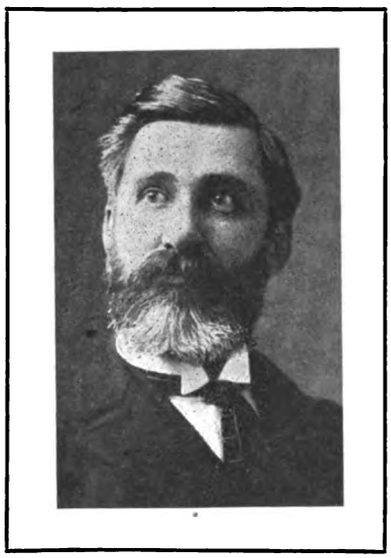
The West Virginia Convention

ALTHOUGH this was only its second meeting, the West Virginia Independent Telephone Association held a very successful convention at Wheeling on May 9th and 10th. Early in the day the meeting opened with a large attendance, and Mayor C. C. Schmidt welcomed the delegates warmly to the city. A cordial response to his greeting was made by J. Walter Barnes, of Fairmont. Immediately after this opening the routine business was taken up, and Secretary Davis read the minutes of the first convention, which was held last year in Parkersburg. Treasurer Lloyd Beeghley read his report, which was approved. President Handlan in his annual address gave a general review of the telephone situation throughout the country, but more especially in his state. Remarks on the growth of Independent companies, and the value of closer relations, which are being developed as their service increases and the state becomes better organized, were greeted with special attention. After Mr. Handlan had finished, an address was made by E. K. Hertford, general manager of the Charleston Home Telephone Company, of Charleston, which was agreed by the members to be an exceptionally able paper. Mr. Hertford spoke this year on the subject of "Telephone Associations," although he is perhaps best known as a student of operating problems, having devoted a great deal of attention to operating methods in his exchange, even devising an automatic arrangement for recording certain details in connection with the timing of calls.



J. Walter Barnes.

As the roll call was made during this first session of the convention, the delegates in each company not only gave their names and those of the companies they represented, but also gave a brief statement of local conditions. This served to make the members of the Association better acquainted with affairs throughout the state at the very start of the meeting. President Handlan appointed several committees for facilitating the handling of business at the convention, and those who were chosen to serve on them were as follows:

Resolutions, J. Walter Barnes, Lon H. Hutchison and Bruce Ash; nominations, L. L. Long, B. F. Farrell and E. K. Hertford; legislation, John A. Howard, T. P. Moats and A. C. Davis.

After these appointments had been announced the convention adjourned for the day, and the members attended in the evening a vaudeville entertainment and banquet, which was thoroughly enjoyed.

On the second day many subjects of general interest were discussed, and considerable benefit was derived by the members from an opportunity to listen to the views of experts. Not only did some of the best men in West Virginia describe their experiences, but telephone men from the neighboring states participated in a way which was thoroughly appreciated by the West Virginia men. The program for this meeting was as follows :

Standard Construction, Frank B. Hall, Rochester, Pa., Consulting Telephone Engineer.

Value of Good Toll Lines, Frank Hart, Pittsburg, Pa., Supt. Long Distance, Pittsburg & Allegheny Telephone Company.

Pooling of Toll Lines, W. C. Handlan, Wheeling, General Manager National Telephone Company.

The Folly of the Sub-licensee, J. Walter Barnes, Fairmont, General Manager Consolidated Telephone Company.

Our Employes, Lon H. Hutchison, Huntington, General Manager Huntington Mutual Telephone Company.

The Right of Territory, J. W. Downs, Buckhannon, General Manager Buckhannon Telephone Company.

Independent Telephone Securities, A. C. Davis, Parkersburg, General Manager West Virginia Western Telephone Company.

Rural Telephones, T. B. Lee, General Manager State Mutual Telegraph & Telephone Company, Waynesburg, Pennsylvania.

During the afternoon session of the convention officers for the coming year were elected as follows: President, A. C. Davis; secretary, Lon H. Hutchison; treasurer, Lloyd Beeghley. The Executive Committee which handled the affairs of the association during the past year will continue in office without change. Its members are W. C. Handlan, J. Walter Barnes, Lon H. Hutchison, E. K. Hertford and A. C. Davis. Mr. Barnes was re-elected a member of the Advisory Board.

THE ARKANSAS CONVENTION—ADJOURNED MEETING.

THERE were about twenty-five delegates present at the adjourned meeting of the Arkansas Independent Telphone Association, held at the Electric Park, in Fort Smith, May 20, nearly all of whom were from the western part of the State. This meeting illustrates the good of conventions in a peculiar way, as there was no one present who knew all the delegates, and there were very few who knew more than two or three of those present.

Mr. A. E. Boqua, Jr., welcomed the delegates in the absence of his father. He handled the matter nicely, and was busy all day in the interest of the association.

The president, Mr. P. C. Ewing, of Little Rock, responded, saying in part: "As a matter of current news and appreciable gossip we note that the State has above 40,000 toll telephones not owned by the Bell company in operation, but on account of our lack of toll lines about seventy-five per cent of them are connected with the Bell company. We believe that if we will furnish this seventy-five per cent with the connections which they need, over 90 per cent of them will come with us.

"Our exchanges are constantly being improved. The Pine Bluff exchange has lately added materially to the betterment of its lines by installing cable in place of open wire, and making lines metallic. The Little Rock exchange has rebuilt a large section of the city with practically all cable metallic construction. The Russellville exchange has been greatly improved under its present management and reports good paying business. Jonesboro has about completed a 600 line exchange of modern construction, which has been spoken of in the highest terms by those who have seen it. We have been informed that Bald Knob is branching out in their work. Taking the situation throughout the State, the increase and improvements since our last meeting show very satisfactorily.

"We make this business proposition as an axiom, no matter what class of business it may be applied to: Find out what your customers require, and then furnish it to them. If you do this they will cheerfully pay you a reasonable price, a price that will assure you of financial gain and pleasant business relations. Failure on your part to furnish them what they require, giving them instead something inferior and unsatisfactory, even at half price, will cause trouble between you and your customers and eventually troubles in your finance.

"About twelve years ago we commenced building Independent exchanges in this State (we will except Fort Smith, which had an Independent exchange several years previous to that). At that time the greater part of the business was purely local, few toll lines were in operation and very few people, comparatively, used them. But, with the stimulus injected into the business by the Independents there followed an increased demand

Digitized by Google

for territorial lines. Right here the Independents made their first and probably greatest mistake. Companies were organized and they with individuals built local exchanges in practically every town where there was a Bell plant, and of nearly the same capacity, which in a very short time was entirely inadequate to the demands of the locality.

"Demands soon came for territorial service, but the companies and individuals could not furnish it, being taxed to their utmost to take care of the local business; the consequences were failure to supply their customers what they required. The conditions in other states were similar to those in this state, but in most cases they were met fairly and squarely as they developed. If the local exchanges were able they extended their lines to meet each other; if not, other companies were organized to build the connecting links.

"It has been our habit to do one thing at a time and when we made a mistake to correct it as soon as possible. When this mistake of practically isolating ourselves from each other has been corrected, the faults, mistakes and difficulties under which we are laboring will be comparatively easy of solution.

"And now the remedy—shall we do as some of our half-brothers have done and obtain the necessary connection with the A. T. & T. Co.? Individually I am opposed to the crime of suicide and especially in this form. It is my serious intention and desire to live as long as I can see any one else live, and to do my talking over and through Independent telephones and cables.

"Another method is to build connecting links in your immediate territory, as has been done in other states. This has the objection of possible lack of uniformity, but is much better than nothing. Still another method, which appears to be the best, is to have one long distance company. This has been done in part only by the organization of the Telegraphone Company, chartered and owning the right of way between Pine Bluff and Little Rock, and it is for the common interest of the members of the association to co-operate with this company in every possible way."

Among the companies represented were: Home Telephone Company, Ozark; Little Rock Telephone Company, Little Rock; Pan Telephone Company, Fort Smith; Russellville Telephone Company, Russellville; Franklin County Telephone Company, Paris; The Telegraphone Company, Little Rock; North Arkansas Telephone Company, Fayetteville; Siloam Springs Telephone Company, Siloam Springs; Branch Telephone Company, Branch; Sebastian County Telephone Company, Spring Hill; Western Telephone Company, Ozark; Felker Telephone Company, Mulbury.

The Manufacturers represented were: Stromberg-Carlson Telephone Manufacturing Company, Rochester, N. Y.; North Electric Company, Cleveland; Frank B. Cook, Chicago; American Electric Telephone Company, Chicago.

Mr. Chas. Suttor, of St. Louis, arrived on the afternoon train and immediately on arrival requested details as to the present plan for long distance lines in the state. When these were furnished him, after getting all the facts he expressed his approval and agreed to get behind the proposition after his engineer has approved the plans. This is believed to mean much to the movement, as Mr. Suttor has the reputation of being a man who does things.

MANAGING A TELEPHONE COMPANY'S SUPPLY DEPARTMENT.

(*Continued from page* 395.)

a private branch exchange, or switchboard paraphernalia; something that will not be likely to occur again, but it must be accounted for.

The writer would treat this as he does "Incidentals." The "Special Equipment" card shows the date, number of the purchasing order and distribution. Then if one wants to refer to it he has a chain of references leading back to the man who ordered it purchased. The one rule to be remembered is to charge "Incidentals," "Special Equipment," etc., as soon as the invoice reaches you, before you forget the prices and other details.

This idea can be elaborated upon still further, to provide a separate card for each of a variety of articles that are similar but not alike, as "Stove bolts, all kinds"; "Soap, all kinds"; "Furniture polish," and a dozen other lines; things that take more time in the accounting than in the using. These are all carried in the warehouse, to be sure, but they are no longer in the warehouse accounts.

(*To be continued.*)

NO FREE TELEPHONES.

THE Steinauer Telephone Company has removed its telephone from the depot in Steinauer, Neb., its contention being that the instrument cannot be longer maintained there according to law. The action was taken to comply with the anti-pass law, there being a provision that a public service corporation cannot extend such courtesies to another corporation or individual. No charge had been made for the use of the instrument, but the telephone was maintained there for the accommodation of the company's subscribers.

TELEPHONE LEGISLATION IN TEXAS.

(*Continued from page* 400.)

him, them or it, a like service, if the transportation or transmission is a like kind of traffic or service under substantially similar circumstances and conditions, and any such company violating this provision shall be deemed guilty of a misdemeanor, and for each offence, on conviction, shall pay to the State of Texas a penalty of five thousand dollars."

Sections 6 and 7 provide that "Any person other than the person excepted in this act, who uses any such free tickets, free pass or free transportation, frank or privilege over any railway or other transportation line or sleeping or express car, telegraph or telephone line mentioned in this act, for any distance under the control and operation of either of said companies subject to the provisions of this act or under their authority, or shall knowingly and wilfully by any means or device whatsoever obtain, use or enjoy from any such company a less fare or rate than is charged, demanded, collected or received by any such company, from any other person, firm, association or persons or corporation for doing for him, them or it, a like service if the transportation of service or of a like kind of traffic or service under substantially similar circumstances and conditions, such person or such officer or agent who acts for such corporation or company thus favored, shall be guilty of a misdemeanor, and on conviction for such offense, shall be fined not less than $100 and not more than $1,000.

"Any director, officer, agent or any receiver, trustee, lessee or person acting for or employed by any company subject to the provisions of this act who alone or with any other corporation, company, person or party, shall wilfully do, or cause to be done, or shall wilfully suffer or permit to be done any act, matter or thing in this act prohibited or declared to be unlawful, or who shall aid or abet therein, or shall wilfully omit or fail to do any act, matter or thing in this act required to be done, or shall cause or shall wilfully suffer or permit any act, matter or thing so directed, required by this act to be done, not to be done or shall aid or abet any such omission or failure, or shall be guilty of any infraction of this act or shall aid or abet therein, shall be deemed guilty of a misdemeanor and shall, upon conviction, be subject to a fine of not less than $100, nor more than $1,000, and if the offense for which any person shall be convicted under this section shall be unlawful discrimination in rates, fares or charges for the transportation of passengers or property or the transmission of messages such persons may, in addition to the fines hereinbefore provided for, at the discretion of the jury, be imprisoned in the penitentiary for a term of not less than six months nor more than two years."

It is believed that in view of the above legislation, discrimination will cease and without discrimination and unfair methods the Bell Telephone Company will be unable to crush the Independent companies now operating in Texas or to prevent the steady invasion of other territory by new companies.

From Here and There

BELL COMPANY ENDEAVORING TO FORESTALL GOVERNMENT LINES WITH CANADIAN FARMERS.

REPORTS from various parts of Manitoba show that the Bell Telephone Company is actively convassing farmers with the object of inducing them to establish rural telephone lines. The company now offers to provide long distance connections, the lack of which under reasonable terms was the cause of the great agitation of last year.

Prominent Independent telephone men are pointing out that it would, of course, suit the purposes of the Bell monopoly admirably to have rural feeders for its long distance lines supplied at other people's expense. It would be a case of the people taking their grist to the Bell's mill. The farmers would stand the cost of the least profitable business—the rural branch lines—and the Bell would reap the profits of a largely expanded long distance business.

At the same time they draw attention to the fact that whatever else the farmers do in the direction outlined by the Bell Telephone Co. they should be careful not to enter into any contract with the company. It will be the policy of the Bell people to tie up as many people as possible on one, two and three years contracts in order to forestall the government owned system. No matter how attractive the Bell may make its offer, it should not be permitted to have any exclusive rights of connection with rural lines. Whatever lines the farmers build they should hold free to accept at any time the benefits of connection with long distance lines of the public telephone system.

A NEW WAY TO BEAT A BAD LINE.

FRED WINTERS, special correspondent for the Associated Press, Chicago, Ill., is probably the originator of a decidedly novel method of communicating over a telephone line where the quality of transmission is poor. It seems that some time ago he was trying to talk with an associate at the other end of a wire over which it was absolutely impossible to distinguish words.

An occasional letter could be heard, and it was evident that the wire was connected through all right. Mr. Winters hesitated only for a moment, then seized an empty cigar box and placed it against the transmitter, drew out a penknife and tapped off a message in the Morse code on the improvised resonator. Then he listened at the receiver, and in a moment had the satisfaction of hearing the familiar Morse signals clicking back in response from the other end of the line.

HOME TELEPHONE COMPANY WINS ENTRANCE TO CONDUITS IN NASHVILLE.

AFTER a fight covering a period of three years in which the Home Telephone Company of Tennessee won in the courts and in the state legislature, the city council of Nashville has agreed to allow the company to go into the conduit system now being constructed there by G. M. Gest. The Home company first suggested a conduit system, but the city council refused it a franchise. Pending the course through the courts the Cumberland company made the city a proposition to go into conduit with the Western Union, Postal Telegraph, light company and the city light lines. The deal was closed and the city council passed an ordinance forcing all wires underground in the congested business districts of the city. With the conduit system partly finished and belonging to other interests, the Home company had a difficult problem to solve, when it finally won every case in court and secured a new law governing telephone companies. The matter was taken up by citizens who assisted the Home company, and the council has finally decided to let the company into the conduit contract.

Those who have kept in close touch with the situation say that if there is any character of obstacle this company has not gone up against since it began the fight with the Cumberland company it is not in the records of the difficulties of Independents. Only one more straw is in the way—the constitutionality of the law passed by the recent legislature granting telephone companies the use of streets and public highways. This case is now in court and with it settled the Home Company of Tennessee will probably have smooth sailing.

A VIGOROUS PROTEST.

NOT long ago an official at the headquarters of one of our large telephone companies received a letter which was the occasion of considerable amusement among the staff, and is well worth passing along. Here it is, heading and all:

JEAN DE VEAU
DEALER IN
CONFECTIONERY, FRUITS, TOBACCO,
CIGARS, FRESH CANDIES AND SOFT DRINKS.
ICE CREAM AND OYSTERS IN SEASON.
———, New Mexico.

——— Telephone Company,
———, New Mexico.

Sirs.

I am writing you in regard to the satasfaction we are getting at —— we have not had no satasfaction for to weeks not atall it is very tiresom now if you dont see to that atonce I will take your phone an throw it out In the street. I am. very tired of that kind of work I have bin treying to tell them about it but I could not get thèm to the phone it seams like you cannot get no satasfaction outen of the mgr him he flirts with them and he dont care for us. now I am writing you I mean business or I would not write now see to that at once. our I will do as I said I am not going to stand here and loose my time trying to talk to them and not get eny thing for it

now please see to that. amediatly

Yours truly

JEAN DE VEAU

Of course there was no way to avoid firing the manager after this!

CONNECTICUT TELEPHONE SUBSCRIBERS LEARN MUCH ABOUT COMPETITION.

AS is generally known, the state laws of Connecticut are such as to practically give a complete monopoly to the Bell company which operates there. Efforts are being made to effect changes which will permit Independent companies to operate in this territory, and a general campaign of education is being carried on. Recently full page advertisements appeared in the newspapers of Hartford, the capital of the state, tending to show how competition has increased development, and also reduced rates in a considerable number of states where Independent systems have been in operation for some time.

PETERSBURG, IND., REFUSES TO EXTEND BELL FRANCHISE WITHOUT COMPENSATION.

THE franchise of the Cumberland Telephone & Telegraph Company at Petersburg, Ind., will expire this month and the city council has notified the company of the terms on which it may be renewed. The council's notice says that unless the Cumberland company pays $500 cash into the city treasury and enters into a contract to pay 2 per cent. annually on gross earnings on all business within the corporate limits the franchise will not be renewed, and the company will be compelled to cease doing business in the city and to remove its property from the streets.

The citizens are urging the council to strictly enforce its demands since the arbitrary treatment of the patrons during the earlier years of the company's occupation of the city have not been forgotten.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

SECOND HAND switchboards for sale—2 100 capacity Chicago Telephone Supply Co.; 1 200 capacity and 1 100 capacity Western Telephone Construction; 1 100 capacity Swedish-American; 2 50 capacity and 2 100 capacity Eureka; 1 100 capacity Standard; 3 100 capacity Keystone; 3 200 capacity and 1 100 capacity North. Address Victor Telephone Works, 6583 State St., Chicago, Ill. 817

FOR SALE, dirt cheap, 100 series 'phones, with Ericsson transmitters, Holtzer-Cabot generators and oak cabinets. Good as new. Address, R. Valentine, Janesville, Wis. 848

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Position with telephone company on construction or instrument work. Five years' experience, best of references. Address Box 836, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 836

WANTED—Wire chief. One who has had good experience as switchboard man. In answering state salary wanted, former experience, whether married or single, and give references. Address, Merchants Mutual Telephone Company, Michigan City, Ind. 852

WANTED---Continued

WANTED—Back numbers of AMERICAN TELEPHONE JOURNAL for January, February and March, 1907. Address, stating lowest price, Box 840, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 840

WANTED—Telephone workmen; 3 foremen, 30 linemen, 6 cable splicers and 10 outside trouble men, to take places of strikers. Permanent positions at good wages for first-class men. State experience and give reference when applying. National Telephone Company, Wheeling, W. Va. 847

WANTED—Position as manager or superintendent of telephone exchange. Central energy or magneto. Can furnish best reference as to ability, habits, etc. Address Box 841, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 841

WANTED—Salesman for telephone instruments and supplies for New York State, Pennsylvania or the Middle West. An exceptional opportunity for the right man. Address Box 843, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York City. 843

WANTED—Position as engineer of new telephone company entering the field, or with a company controlling a system of exchanges. Can give best of references. When replying, please state salary and prospects. Address Box 849, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York City. 849

WANTED—Two first-class cable splicers at once. York Telephone Co., York, Pa. 850

WANTED—Manager system of two exchanges, 200-line and 50-line, with toll lines. Man with ambition to become part owner. Address F. H. Davis, Cuthbert, Ga. 851

In the Field of Invention

TELEPHONE TRANSMITTER.

R. C. Browne, Salem, Mass., patent 854,025, May 21, 1907, assigned to J. Abbott, Winchester, Mass.

The novel feature of this transmitter is the construction of the resistance chamber. In lieu of the customary vertical electrodes, the sides of the chamber are of mica, or some other resilient, non-conducting material. The layer of granular carbon is very thin, but of great width, the increase and decrease in resistance of the chamber being accomplished by causing the layer of carbon to be alternately thickened and thinned by the vibrations of the diaphragm.

The current traverses the granular carbon in a direction perpendicular to the direction of the sound waves, the inventor claiming that a greater microphonic effect is caused by so doing.

SELECTIVE SYSTEM.

G. Babcock, Chicago, patent 853,291, May 14, 1907, assigned to S. C. Tel. Mfg. Co.

This is a system of selective ringing for magneto exchange systems. The switchboard is provided with two sets of jacks, one of which is bridged across the metallic sides of the line for signaling the instruments thus connected. The other set is bridged from line to ground through the center of the winding of a balance coil connected across the line. Two selections are made on each set of jacks by reversal of the polarity of the current, thus giving a four-party system of selection.

There is also provided, in each subscriber's station, a switch for the purpose of so arranging the connections between the instrument and the line as to allow of one subscriber signaling another subscriber on the same line without causing a disturbance of the remaining telephones on the line or of the central office operator.

PARTY LINE LOCKOUT.

G. E. Terhune, W. M. Eidson, W. B. Huston, Willow Hill, Ill., patent 854,543, May 21, 1907.

This invention describes a step by step selective party line lockout. It comprises an arrangement of three relays, four cogged wheels, an indicator and an automatic circuit closing switch, by means of which the battery impulses are sent out upon the line.

TELEPHONE SYSTEM.

W. W. Dean, Elyria, Ohio, patent 854,279, May 21, 1907, assigned to Dean Electric Co.

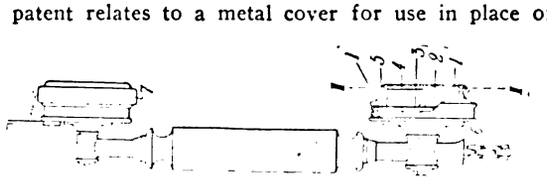
This relates to a common battery telephone system having the feature of automatically restoring subscribers' lines to their normal condition immediately upon the completion of a conversation between connected subscribers.

This is accomplished, the inventor states, by the use of supplementary cut-off relays in the cord circuits. These relays are actuated, upon the replacing of the respective receivers upon their hooks, by the action of the supervisory relays. This immediately cuts the subscribers' lines entirely free from the cord circuit apparatus, leaving the subscribers in position to make further calls, even though the operator has not removed the previous connection.

HAND MICROPHONE.

C. G. F. Holomgren and A. E. Brahn, Stockholm, Sweden, patent 841,399, Jan. 15, 1907, assigned to L. M. Erricson & Co.

This patent relates to a metal cover for use in place of the



customary transmitter mouthpiece, on hand microphones of the type wherein the transmitter 6 and receiver 7 are mounted parallel on the handle bar. The cover is imperforate on the surface but is provided with openings 4 on the edge facing the receiver through which the sound waves may pass to the transmitter diaphragm 3. The object of the invention is to preclude the possibility of entrance of saliva and other impurities into the transmitter.

CONDUIT PLUG.

W. L. McGowan, Philadelphia, Pa., patent 849,415, April 9, 1907.

This patent relates to a device comprising a plate of sheet metal *D*, to which is attached by means of the studs *F*, two

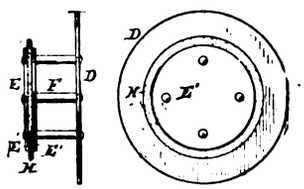


FIG. 2 FIG. 3

metal plates *E* and *E'*, between which is secured the rubber washer *H*. The object of the device is to provide a satisfactory plug for the sealing of unoccupied ducts in a conduit system, to prevent the entrance of moisture and foreign matter which might have a tendency to injure the sheathing of the cable when it is pulled in. Fig. 3 shows a rear elevation of the plug.

TRUNKING SYSTEM.

W. W. Dean, Chicago, Ill., patent 854,337, May 21, 1907, assigned to Kellogg S. & S. Co.

This patent relates to a trunking system between common battery exchanges of the two-wire type. It is so arranged as to allow the operator, at the exchange in which the calling subscriber's line terminates, to signal the called subscriber direct over the trunk, also to allow the called subscriber to signal the initial operator by the movement of his receiver hook direct without the necessity of intervention by the operator in the exchange of the called subscriber.

SPRING BINDING POSTS.

John Schade, Jr., Brooklyn, N. Y., patent 12,642, reissued April 23, 1907, and assigns to Fahnestock Electric Co.

This patent covers improvements on spring binding posts as shown in application No. 179,101, dated October 29, 1903, and illustrates eight different forms of spring clips in which the fundamental idea is the use of a single piece of resilient metal having a V shaped retaining piece so arranged as to act in opposite direction with the other end of the resilient strip and so co-acting with it that when a conductor is introduced in the retaining piece the forces working oppositely will tend to grasp it securely so as to assure of positive electrical contact between the conductor and the clip.

TELEPHONE SYSTEM.

C. D. Enochs, La Crosse, Wis., patents 854,203 and 854,204, May 21, 1907, assigned to Vote-Berger Co.

These patents relate to a common battery telephone system in which the flow of current and the resistance of the subscribers' lines is regulated by a steadying resistance or ballast. In the system described the line signal is directly in series with the central office battery, thus obviating the necessity of a controlling relay, as is customarily used.

The ballast comprises a fine wire enclosed in a sealed chamber. This wire decreases in conductivity as its temperature rises, and vice versa, the inventor claims. Which being the case, regulates the flow of current through the line signal and the subscriber's transmitter in such a manner as to provide for a uniformly efficient service.

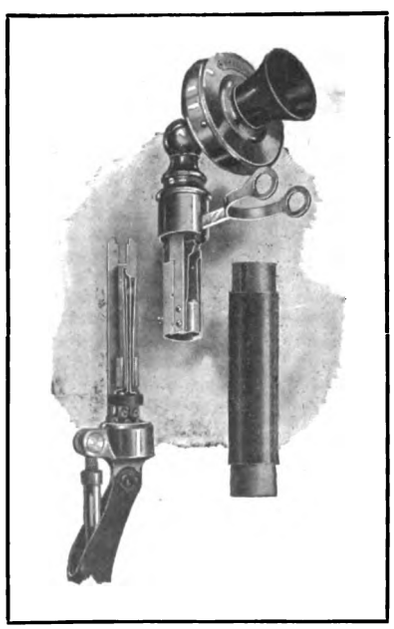
THE FLEXIPHONE A GLOBE TROTTER.

LESS than six months ago the Flexiphone was first called to the attention of the public through the columns of THE AMERICAN TELEPHONE JOURNAL, and now these instruments are in use in nearly every state in the Union. You will find them in Mexico, in South America and in Europe. It is seldom that a new device "catches on" with the public, and especially with the technical public, as has the Flexiphone, and the fact that it has done so, would indicate that it has points of merit and that these points are real and strong are quickly apparent.

The Flexiphone was designed to eliminate, first, trouble and expense due to breakage and kinking of the conductor cords; second, to better the service to the subscriber by having a telephone that would be quickly accessible to any one sitting or standing, and yet always out of the way. This instrument seems to accomplish both of these ends without encumbering the old standard type of telephones with a lot of mechanism, being in itself a simple, neat and graceful device which is complete.

Flexiphone in Residence, Acting Not Only to Support but to Adjust Transmitter to Any Position.

The greatest field for this instrument would seem to be in the business office, yet experience has demonstrated that the Flexiphone is also well adapted to the private home. The user of a Flexiphone in a residence does not have to stand with a heavy telephone in one hand and a receiver in the other, and drop both in her haste to jot down a message; nor does she have to buy a $10 table on which to set the telephone, or get a wall telephone and climb on a hassock should she be a little short. The Flexiphone takes care of all these conditions and all these troubles without any fuss or feathers, and does not get in anybody's way in doing it.



Flexiphone Separated to Give Access to Wiring.

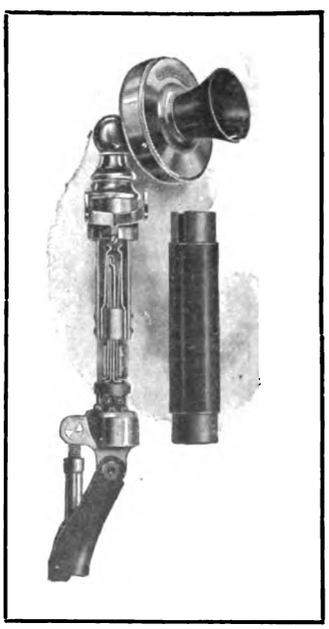
Apart from its handiness, the Flexiphone has features of construction and design that deserve mention from the electrical standpoint. The accompanying illustrations show the Flexiphone taken apart (and this is done by the removal of only one screw), and again with the electrical parts reassembled, only the outside casing remaining to be put on. In the last view all the parts are in operative relation with spring contacts, cord connections, etc., in full view for inspection and location of trouble. These cord connections are made to a flat hard rubber terminal block, securely fastened to the frame on which the switch springs are mounted. The contact springs are of German silver, with pure platinum points arranged to make long sliding contacts when the sections are reassembled by the inspector or trouble man. The switch hook is independently supported and operated by an auxiliary steel spring, permitting the full elasticity of the contact spring to be exerted in making perfect connections. The transmitter is mounted on a special head adapted to rotate in a horizontal plane through an arc of 60°, and differs from other solid-back types in having a hermetically sealed receptacle for the electrodes and granular carbon, precluding any ill effect due to humidity or adverse atmospheric conditions. All of the electrical parts are entirely insulated from the metallic frame, avoiding among other things the possibility of danger or accident from current at an abnormally high voltage.

The receiver is the standard American bi-polar pattern.

The makers of this instrument, the Oliver Mfg. Co., Philadelphia, Pa., are prepared to supply the Flexiphone either for central energy, series or bridging work, and to supply all the accessories for such work, such as generators, ringers, etc. As a money saver and business getter the Flexiphone is said to be coming up to all expectations, and is a device that should be thoroughly investigated by every one interested in the telephone business.

W. O. RHODE TO MANAGE CENTURY'S KANSAS CITY BRANCH.

THE Century Telephone Construction Co., of Buffalo, N. Y., has located its branch office in Kansas City, Mo., at 408 Delaware street. This office will be in charge of Mr. W. O. Rhode, who was formerly manager of the Kansas City branch of the Swedish-American Telephone Co.



Access to Switch Contacts May Be Had by Simply Removing Tube.

STROMBERG-CARLSON TELEPHONE MFG. COMPANY, Rochester, N. Y., has prepared an exceptionally attractive book, entitled "How the Telephone Helps the Farmer." It should be extremely useful to those who are engaged in promoting rural line development. The first chapter gives a comprehensive summary of the features of telephone service which are especially useful to the farmer. This is followed by a telephone story, which drives some of the points home in a pleasing fashion. Other parts of the book tell how to interest neighbors to organize farmers' lines, giving the cost of building and information which will be useful in the selection of telephones.

Good News—and It's All New

NEW COMPANIES.

ALMA, CAL.—The Alma Telephone Company has been organized with the following officers: President and manager, Ed. Frank; vice-president, Geo. Osmer; treasurer, C. Hoult; secretary, A. Hueter.

WOLFLAKE, IND.—The Farmers' Mutual Telephone Company has been organized, and has commenced the construction of its system. Connections are to be established with the Farmers' lines in Whitley county.

ZENAS, IND.—The Zenas Independent Telephone Company has filed articles of association with the Secretary of State. The capital stock is placed at $2,500, and it is the company's intention to build an exchange in Zenas, and extend lines throughout portions of Jennings and Decatur counties. Lafayette Speer has been elected president; and John J. Hulton, secretary.

BAGLEY, IA.—The Bagley Mutual Telephone Company, with a capital stock of $9,990, has been incorporated.

LANYON, IA.—Articles of incorporation have been filed by the Lanyon Mutual Telephone Company, Lanyon, Ia. It has an authorized capital stock of $5,000, and the incorporators are G. T. Paterson, J. Albert Anderson, Gust. Burman, J. A. Brown, Edward Peterson, D. E. Carlson, Limas Goodale and I. L. Reedholm.

PERSIA, IA.—The Persia Mutual Telephone Company of Persia, Harrison County, has been incorporated with a capital stock of $10,000. Among the incorporators are E. C. Campbell, H. A. Moss, I. W. Evans, W. V. Hilbron, M. H. Baker and others.

FALL RIVER, KAS.—A farmers' telephone company, to be known as the Greenwood Telephone Company, has been organized west of Fall River, and the following officers elected: N. Crawford, president; Wm. Woods, vice-president; Alec West, secretary, and Andy Sharp, treasurer.

COLFAX, LA.—An Independent telephone company, whose intention is to construct a line from Colfax to Cloutierville, is being organized at this city. Among those interested in the enterprise is M. M. Mandott.

FAIRMONT, MINN.—A new telephone company, which is to be called the Independent Farmers' Line, has been organized, and will connect its lines with the exchange at Fairmont. The officers of the newly organized company are: Julius Simon, president; Earl Prentice, secretary; John A. Hiller, treasurer; Henry Benck, P. Berndt, James McNerny and J. A. Manley, directors.

BRANDON, MISS.—Articles of incorporation have been filed by the Brandon & Daniel Telephone Company, of Brandon, Rankin county. It has an authorized capital stock of $10,000, and the incorporators are V. H. Russell, H. A. Jones, W. H. Patrick and others.

NORMAN, NEB.—The Kearney County Independent Telephone Company has been organized with a capital stock of $15,000, fully paid up, and the following officers elected: President, A. M. Anderson; vice-president, I. H. Slater; secretary, J. F. Barnes; treasurer, G. P. Kingsley.

TIOGA, N. D.—The Tioga Farmers' Telephone Company, of Tioga, N. D., has been incorporated with a capital stock of $8,000. Among the incorporators are A. Stakston, J. Izaacson, W. H. Dixon and others of this city.

HIGGINSPORT, OHIO.—Articles of incorporation have been filed by the Higginsport Independent Telephone Company of this city. It has an authorized capital stock of $10,000, and Charles B. Williams is among the incorporators.

GUTHRIE, OKLA.—Articles of incorporation have been filed by the Guthrie, Camp Russell and Northeastern Rural Telephone Company of Guthrie. It has an authorized capital stock of $1,300, and the incorporators are Shelton Morris, T. L. Hutchinson and Fred Storm, of Guthrie.

KELL, OKLA.—The Kell Telephone Company, of Kell, has been incorporated with a capital stock of $5,000. The incorporators are P. E. Stomans, F. J. Hausen and John H. Hausen.

POND CREEK, OKLA.—An Independent telephone company, to be known as the Pond Creek Mutual Telephone Company, has been organized by the business and professional men of this city, and sufficient stock subscriptions secured to warrant the organizers beginning the construction of the plant at once. It is the company's intention to install a system at Pond Creek, and to co-operate with the farmers' lines of the county.

TRIBBEY, OKLA.—The Tribbey Telephone Company, with a capital stock of $500, has been incorporated by A. M. Tribbey, C. C. Bailey, D. J. Abbott, J. W. Forster, J. M. Lamm and W. J. McBryde, of Tribbey, and M. A. J. Ticer, of Moral.

EAST BRADY, PA.—The Central Allegheny Valley Telephone Co., East Brady, has filed articles of incorporation. The capital stock is placed at $8,000, and the following directors have been elected: R. A. Thomas, C. Hemmer, F. Ludwick, J. W. Hill, C. P. Graham, East Brady; E. D. Jennings, W. J. Mildren, E. M. Quenn, Queenstown.

FREDERICK, S. D.—The Forbes Rural Telephone Company of this city has been organized, and work on its system will be commenced at once. A branch line to Ellendale is also to be built.

HOUSTON, TEXAS.—Articles of incorporation have been filed by the Central Texas Telephone Company. It has an authorized capital stock of $50,000, and the incorporators are A. B. Foster, W. E. Richards and H. B. Houston.

COX'S LANDING, WEST VA.—The Cabell-Mason Telephone Company, of Cox's Landing, has been incorporated with a capital stock of $5,000. The incorporators are R. F. Brammer, N. J. Cox, Cox's Landing; H. V. Sauns, Sesage; H. W. Carson, Laclede; Azel McCurdy, Huntington.

SUPERIOR, WIS.—Plans for the organization of a co-operative farmers' telephone company are being considered by the farmers of Superior. It is proposed to build a line from this city to Black River Falls, Amnicon Lake and other parts of the county, connection being made with the People's company in the city.

TOLEDO, ONT., CAN.—The Rural Telephone Company, of Toledo and Frankville, has been organized and has commenced the construction of its line between the two cities. It is the company's intention to erect lines to many of the neighboring towns and villages.

FRANCHISES.

GREEN FOREST, ARK.—A franchise to install a telephone system at this city has been granted by the City Council to the Farmers' Union Telephone Company.

ROCKWELL, IA.—The Rockwell Farmers' Telephone Company has been granted a twenty-five year franchise at Rockwell.

VENANGO, PA.—A franchise has been granted to C. G. Mead, special agent of the Meadville Telephone Company, of Meadville, for the installation of an Independent exchange at Venango. Arrangements have been made by him with the Eastern Crawford Telephone Company and Meadville Telephone Company whereby subscribers to the Venango Exchange are to have service with the subscribers of the above named companies without extra charge. This service is to be installed and operated by Mr. Mead personally, and is not to be a part of either the Meadville or Eastern Crawford Company's holdings.

ROCK HILL, S. C.—Application for a twenty-five year franchise has been made by the Rock Hill Telephone Company, whose intention it is to install a common battery system at this place.

SENECA, S. D.—The Seneca Telephone Exchange Company has been granted a franchise by the town board of Seneca, and work on the construction of its system will be commenced at once.

GALVESTON, TEXAS.—The South Texas Telephone Company has applied for a franchise to build additional lines in Galveston.

NORTH YAKIMA, WASH.—The Independent Telephone Company, represented by J. P. Reed, of Seattle, expects to apply for a franchise at this city. It is the intention of the company to make North Yakima the headquarters for Eastern Washington, and to extend the system throughout the district, connecting with long distance systems.

WITTENBERG, WIS.—Application for a telephone franchise has been made by John Eckhoff at this city.

EAST TORONTO, ONT., CAN.—The town council of this city has decided to grant a franchise to the Independent Telephone Company, which now operates in York, Markham, Scarboro, etc., and it will soon begin the installation of its system at this place.

FINANCIAL.

PASADENA, CAL.—The directors of the Home Telephone Company have declared a dividend of $1.00 per share on all the capital stock, payable July 15th.

EAST HAVEN, CT.—The capital stock of the East Haven Telephone & Electric Company has been increased from $3,000 to $5,000. The additional capital will be used in the improvement of its system.

LAWRENCEVILLE, ILL.—The Citizens' Telephone Company has increased its capital stock from $20,000 to $40,000.

PLEASANT HILL, ILL.—The Farmers' Mutual Telephone Company has increased its capital stock from $2,500 to $20,000.

MADISON, IND.—The capital stock of the Madison Telephone Company has been increased by the issuance of $50,000 of preferred stock.

DELTA, O.—The capital stock of the Cass County Home Telephone Company has been increased from $9,750 to $150,000.

WANTED—SPECIAL CORRESPONDENTS

OWING to the rapid growth of the Independent telephone movement in all sections of the country, we have openings for special correspondents in every State to work in conjunction with our already efficient corps. Matter similar to that in our Message and Operating Field pages is especially desired. For details address the Editor.

Good News—And It's All New

WINDSOR, O.—The Windsor Telephone Company has increased its capital stock from $1,500 to $1,875.

COLUMBIA, TENN.—At a recent meeting of the Citizens' Telephone Company it was decided to increase the capital stock from $18,000 to $50,000, the additional stock to be used in rebuilding its plant. The company, which already has exchanges at Mt. Pleasant, Florence and a number of other places, is considering the advisability of establishing sub-exchanges all over the county.

HALIFAX, N. S., CAN.—The Nova Scotia Telephone Company has decided to increase its capital by $200,000 for the purpose of building extensions. The company proposes to call up 50% of this, which will be offered to shareholders at par, one share for each four now held. This will make the capital of the company $900,000.

ELECTIONS.

OMAHA, NEB.—The following officers and directors have been elected by the new Independent Telephone Company of Omaha: U. S. Grant, Jr., San Diego, president: F. H. Stow, vice-president; F. S. Graves, secretary; and C. E. Bittinger, treasurer. Directors: W. F. Ely and F. H. Stow, of Omaha; U. S. Grant, of San Diego.

COHOES, N. Y.—The Cohoes-Waterford Home Telephone Company has elected the following officers and directors: President, J. H. Shine; vice-president, I. H. Griswold; secretary-treasurer, Geo. R. Wilsdon; directors, J. H. Shine, F. W. Kavanaugh, I. H. Griswold, F. H. Sudro, T. M. Brush, Thos. Breslin, G. H. Fitts, P. H. Andrae, Howard Hendrickson, H S. Greene and E. F. Allen.

ROCHESTER, N. Y.—The following officers were elected at the annual meeting of the directors of the Independent Telephone Securities Company: President, George R. Fuller; vice-president, E. W. Peck; secretary, Roy C. McCann; treasurer, Fred W. Zoller.

WAYNE, N. Y.—The Wayne-Monroe Telephone Company has elected the following officers and directors: President, Geo. F. Waters; vice-president, Ledyard S. Cuyler; secretary-treasurer, Judson L. Transue; general manager, John A. Driscoll; directors, Geo. Waters, Pultneyville; Ledyard S. Cuyler, Lyons; Judson L. Transue, Williamson; F. D. Gaylord, Sodus; Dr. Morris, Lincoln; J. A. Driscoll, Rochester, and Geo. R. Miles, Wolcott.

FARGO, N. D.—The following officers have been elected by the North Dakota Independent Telephone Association: President, A. B. Cox, Valley City; vice-president, W. F. Baillie, Hunter; secretary-treasurer, John Carmody, Hillsboro.

MISCELLANEOUS.

LAKE BUTLER, FLA.—The name of the recently organized Independent telephone company at this city is the Lake Butler Telephone Company. It is its intention to commence the construction of its system at once.

SPRINGFIELD, MO.—It is the intention of the Minneapolis capitalists who have taken over the stock and equipment of the Home Telephone Company to organize a stock company with a capital of $400,000 and to build a thoroughly up-to-date system in Springfield.

NORFOLK, NEB.—The City Council of Norfolk is considering the proposition of establishing an independent telephone system in this city.

ELY, NEV.—The White Pine Telephone Company has perfected arrangements for connecting the White Pine Company's lines with the lines of the Utah Independent Telephone Company, giving Ely direct communication with Salt Lake City. Later connections will be established with Tonopah and thence to Reno.

STEAMBURG, N. Y.—The Seneca Independent Telephone Company, which was recently incorporated at Red House, is to have its principal place of business at Steamburg, N. Y. The company has purchased of the East Randolph Telephone Company, of which Rollin Dow is manager, all of the latter's interests south of Price Corners, and the lines have been extended through Lebanon, the Bunker Hill district and to Red House. A line is to be built to Freck's Mill by way of Tunesassa. The property is being overhauled and the line put in first class condition.

ALLENTOWN, PA.—Negotiations are under way by which the Consolidated Telephone Company of Allentown is to purchase the Tri-State Telephone Company of Uniontown, in Fayette, Green and Westmoreland counties. The Tri-State Company is capitalized at $250,000.

With the Builders

FT. SMITH, ARK.—The telephone line between Fort Smith and Paris, owned by J. S. Cotner and J. W. Biggerstaff, is being rebuilt.

YELLVILLE, ARK.—The Ward Telephone Company is soon to commence the construction of its system which will connect Yellville, Cotter, Harrison, Marshall and Leslie, with an additional line at Branson, Mo.

EAST HAVEN, CONN.—It is the intention of the East Haven Telephone & Electric Company to greatly enlarge its plant and extend its service.

LAMAR, COLO.—The Lamar-Springfield Telephone Company is building lines to Carrizo and Kenton.

KEOKUK, IA.—Work on the construction of its new exchange building has been commenced by the Mississippi Valley Telephone Company.

ORIENT, IA.—A telephone line is being constructed by the Town Telephone, Light and Traction Company.

HOWARD, KAS.—About $20,000 has been expended by the O. B. Walker Telephone Company in the improvement of its system.

EAST HEBRON, ME.—The East Hebron Telephone Company has been organized, with the following officers: A. M. Fogg, president; A. F. Eastman, vice-president; F. B. Keene, secretary and treasurer; A. F. Eastman, general manager; I. F. Saunders, Ora P. Brown, Alton S. Keene, F. B. Kum and A. M. Fogg, directors. They will begin construction work at once from South Buckfield to East Hebron, thence to Hebron Station.

S. W. HARBOR, ME.—The Island Telephone Company will begin the construction of fifty miles of metallic circuit at once. It will install 130 telephones and a 100-drop switchboard. Mr. A. M. Fogg, of East Hebron, Me., has been elected superintendent of construction and will enter upon his duties in this connection immediately.

TORREON, MEX.—The Woesner Telephone Company, owned by J. Woesner, has just completed lines to Gomez, Palacio, Lerdo and Matamoras.

ROCKLAND, MICH.—Lines from Rockland to Ewen are being constructed by the Ontonagon County Telephone Company.

FAIRMONT, MINN.—The Banner Line Telephone Company is building lines east from Fairmont, which will connect with several other rural lines.

JACKSON, MINN.—Construction work is being carried on by the Middletown Telephone Company on its system.

MESABA, MINN.—The Mesaba Telephone Company is planning to establish an exchange at Bovey, giving service to Bovey, Grand Rapids and Windom.

TROY, MO.—The lines of the Troy Telephone Company are being extended.

AVOCA, N. Y.—Among the improvements planned by the Overland Telephone Company is the extension of its lines direct to Bath.

FULTON, N. Y.—The Oswego County Independent Telephone Company is installing its plant at this city. A long distance line is being erected to Syracuse; an exchange is also to be established at Phoenix, and connections are to be made with the Pennellville Independent Telephone Company whereby the Oswego County Independent Company will furnish long distance connections for the Pennellville subscribers.

COSHOCTON, O.—It is the intention of the Citizens' Telephone Company to build a metallic circuit between Coshocton and Millersburg, and also between Warsaw and Millersburg.

LOGAN, O.—A line from South Perry to this city is being erected by the Citizens' Telephone Company.

NEW BREMEN, O.—Rural lines to the north and northwest of New Bremen are to be built by the New Bremen Telephone Company.

ALLENTOWN, PA.—To take care of its increasing business the Consolidated Telephone Company expects to install two additional circuits between Allentown and Bethlehem.

ROSCOE, PA.—The Roscoe Telephone Company, recently incorporated, contemplates commencing the erection of its lines from Roscoe to Stockdale, through Allen township to Allenport, thence to Vesta mines and to Speers borough. A line is also to be built to Long Branch, with branches extending to and connecting with other boroughs and villages.

ABILENE, TEXAS.—Many improvements in its plant have been made by the Roberts Telephone and Electric Company, including the installation of a new switchboard and the stringing of a number of miles of cable.

CRANBROOK, B. C., CAN.—The Cranbrook Electric Light Company is preparing to build a long distance telephone system throughout the Rocky Mountains to connect with the system being built by the Alberta government on the eastern side of the mountains.

ST. MARTINS, N. B., CAN.—The St. Martins Telephone Company expects to extend its lines to Ten Mile Creek.

UNDERGROUND.

SAN FRANCISCO, CAL.—The underground system of the Home Telephone Company is being installed.

ANACONDA, MONT.—The new Independent Telephone Company is soon to commence the installation of its underground system in this city.

MINNEAPOLIS, MINN.—Permission to make changes in its underground system has been asked by the Tri-State Telephone & Telegraph Company.

ITHACA, N. Y.—The Ithaca Telephone Company expects to commence the laying of the conduit for its system at Cornell University.

FARGO, N. D.—The North Dakota Independent Telephone Company is to place some of its wires underground in this city.

NASHVILLE, TENN.—Considerable conduit work is to be done by the Home Telephone Company at Nashville.

RACINE, WIS.—The Citizens' Telephone Company expects to conduct some additional conduit work.

TOMAHAWK, WIS.—Among the improvements planned by the Electric, Water and Telephone Company is the extension of its cable system.

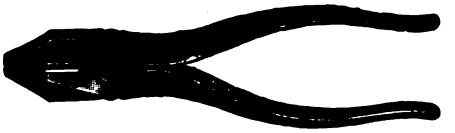
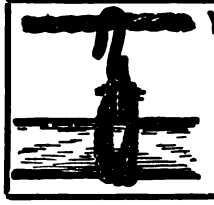
BEWARE OF IMITATIONS



For the protection of our customers we advise that Klein's Pliers are being imitated to LOOK LIKE KLEIN'S. This, however, does not make them Klein's. CAUTION Look for this stamp, M. KLEIN & SONS, on the inside of handles—NONE are genuine without this stamp.
Use only genuine Klein's. They are the product of years of experience and have stood the test of time.
MATHIAS KLEIN & SONS · CHICAGO, ILL.



You Should Know that Marline makes the Best Cable Hanger —and that Security Marline is the Best Marline!
How do we know? Because we've seen the results—because we know how good we make Security hangers, and because customers tell us so. Will you be shown? Prices are low.

THE F. BISSELL COMPANY, TOLEDO, O.
226-230 Huron Street

LOOKING FOR TROUBLE?

Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.
If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.
Does it pay to be informed? You ought to know.
LOUIS M. PIGNOLET, Originator of the Voltmeter Habit
78 CORTLANDT ST., N. Y.

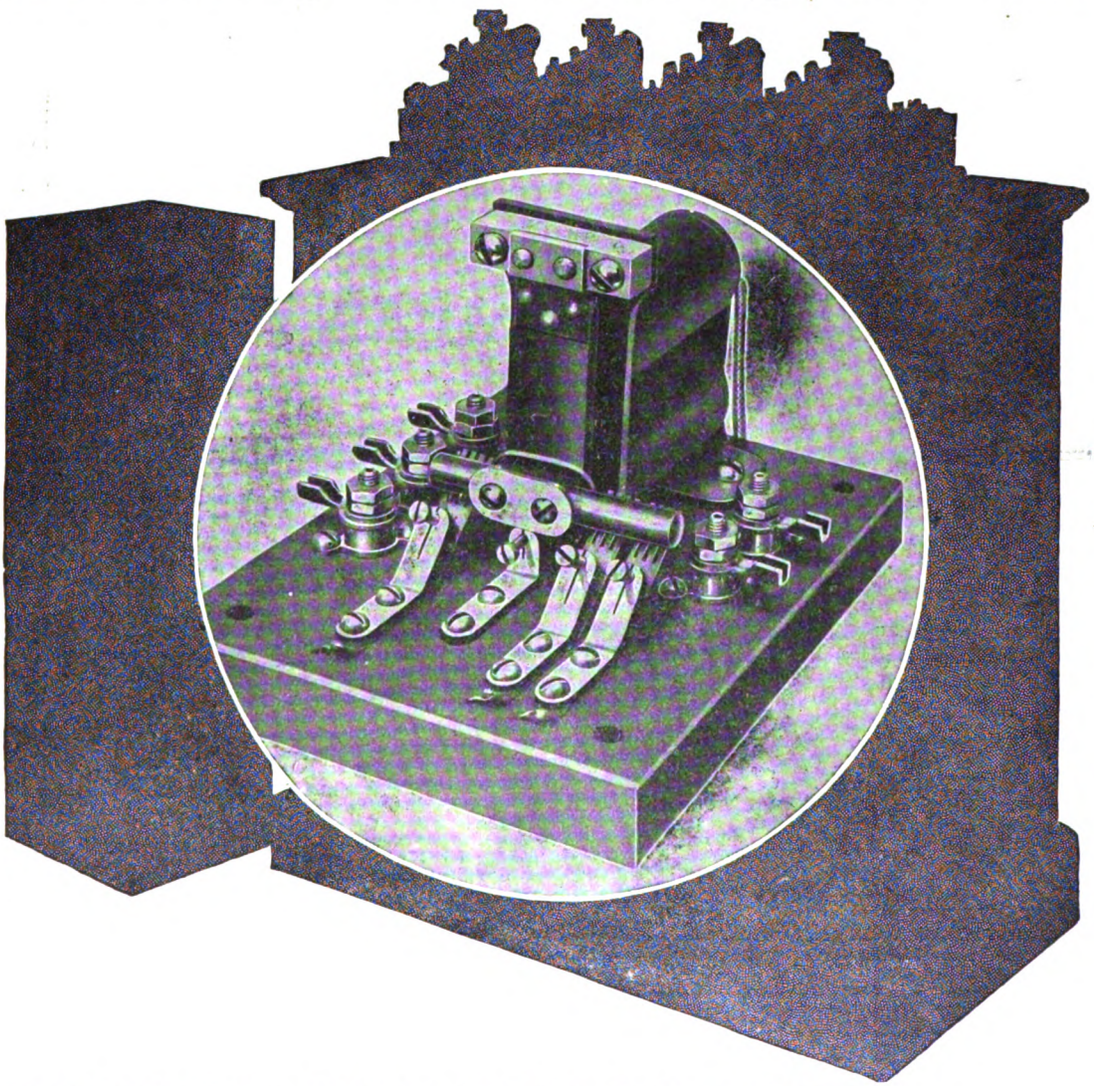
DEAN TELEPHONE APPARATUS

A Dean Electric Detail--Harmonic Converter Relay for Starting the Selective Vibrators



This Primary Circuit Closing Relay in our Harmonic Converter is for closing the circuits of the transformer primaries of the Dean Harmonic Converter, and is especially designed for small exchanges where dry cells are used for the ringing current. A minimum current consumption is imperative for party line selective signaling in the small exchange. This relay, operated by a circuit extending to special contacts on the ringing key at the switchboard, is entirely automatic, not in any way depending on the operator for its prompt and accurate action. It actually starts the selective vibrator and consumes absolutely no current except during the period that the operator is ringing the subscriber. Our folder No. 5 should be in your possession if you wish to have your selective ringing knowledge complete.

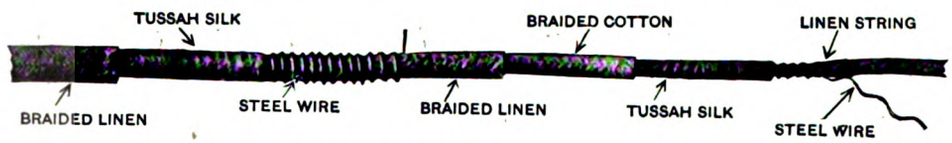
"STROMBERG-CARLSON"
STEEL SWITCHBOARD CORDS

After examining and experimenting with every possible construction for Steel Cords—testing each against the other for conductivity, durability, flexibility—you learn how the cord that gives the most satisfactory service should be made. With the benefit of such experience we naturally feel, with a degree of security, which only comes with the knowledge in knowing you are right, that we offer the most practicable and satisfactory cords for switchboard equipment.

The best construction depends greatly upon good materials. Stromberg-Carlson Cords of the smallest diameter will "live" as long as those of larger diameters, because we use a selected quality, size and strength of thread and wire for each size cord, which was determined experimentally. Furthermore we personally supervise the important operations of selecting, sorting and cleaning all materials which are purchased and "finished" in our Rochester factory for final use.

The illustration following is of one size of our two-conductor Steel Switchboard Cord. Notice the different materials used—the strength in this construction is unequaled.



CORD TIPS

The cord tips furnished with our switchboard cords are designed for service. The No. 16 is hook-shaped so that it will *hang* on the cord fastener and does not require one hand to hold it in place while the other is engaged in operating the screw driver. All "Stromberg-Carlson" Cord Tips are "crimped" on the *bare conductor* of the cord end and in addition *soldered.*

No. 16
Cord Tip for
Switchboard Cords

The Stay Cord is a continuation of the external braiding fastened securely with a metal band "crimped" on.

No. 13
Stay Cord Tip for
Switchboard Cords

OPTION

We offer these cords in 5 ft., 6 ft., 7 ft., 8 ft., and 10 ft. lengths of two and three conductors for any diameter plugs.

Have some put in your switchboard at once and get the best service.

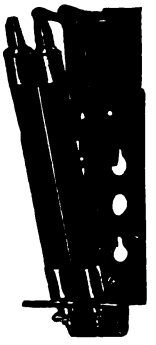
UNIT TYPE MOUNTED LINE FUSE

Mounting Plate is made up of pressed steel on which is mounted the German silver springs insulated by hard rubber blocks.



Protection is made up in units of one pair each equipped with fuses and carbons or fuses only.

The Fuses are of the snap in type, easy to take out, made 1, 2½ or 5 Amperes.

The units are held on frame or strip by two screws making it easy to replace or change location.

All Kollogg Telephone Parts

Are Made From the Best Grades of Material and Are Carefully Assembled by Skilled Workmen, Thus Making Everything High-Grade Throughout

Kellogg Portable Desk Telephone,
For Central Battery or Magneto Use.

The tubular hard-rubber covered standard, with hollow brass shell, nickel plated base, is distinctively KELLOGG.

The transmitter hinges at top of standard, and there is mounted in base the hook switch and hard-rubber terminal block for receiver and desk stand cords.

The hook switch is of the toggle joint type, having a long motion of the springs, thus obtaining most excellent contacts with only a minimum motion of hook.

All necessary parts are properly insulated, are easy of access and everything is made as nearly dust proof as possible.

THIS IS WHY

Horizontal Telephone Cable Splices

HAVE MANY DISADVANTAGES.

First—You have two masses of solder on each end of the sleeve that have to be carefully wiped, which necessitate the employment of a high priced expert cable splicer. Second—Your horizontal wiped joint may not be absolutely moisture proof. Third—When it is necessary to open a joint the solder has to be blown off of both ends and the sleeve moved back or cut. Fourth—It is difficult to get at the inside pairs. Fifth—The sleeve must be moved over the spliced pairs and both ends carefully soldered and wiped when a test or repair is finished. Sixth—It does not admit of changing of multiples without removing the sleeve and solder. Seventh—It takes at least two feet more room in a manhole, in underground cable construction. Eighth—It costs more on first installation.

Compare the above with the ease and economy with which a joint can be made when you use

No. 1.

No. 2.

HARGIS CABLE SPLICING JOINTS

By referring to the six pictures and the following descriptive matter you will get a good idea of its advantages over the old style horizontal wiped joint. No. 1—Showing method of putting cable through lead gasket and brass collar before soldering. Note the cut thus formed. No. 2—The solder at a little above wiping heat is then poured into the cup and any roughness removed by a blow torch and wiping cloth. No. 3—The armor is then taken off the cable and the wires boiled out with paraffine. No. 4—The wires are then spliced as usual, only with greater ease. No. 5—Shows the appearance of the H. S. J. when the pairs are laced ready to be enclosed by the lead casing. No. 6—The joint is completed by screwing the sleeve tight with the spanner wrenches.

Made in three sizes. Costs less on first installation. Saves money while in use. Send in your order to-day.

NO TROUBLE FOR ANYONE

The Livermore One Slot Pay Station

No trouble for the SUBSCRIBER, because there are no levers to pull and no possibility of placing the coin in the wrong slot. Any coin specified by the operator is dropped into the one-slot where it automatically selects the proper signal.

No trouble for the OPERATOR. The signals are mounted together with the transmitter on a bell metal resonator, which is insulated from the box and the coin chutes. This eliminates all rattling noises from the talking circuit, due to the traveling of the coin through the chute, and the operator receives only the clear, easily distinguishable signal.

No trouble for the INSPECTOR. There are no complex air pumps, springs, knives, clock works, or push buttons to get out of order.

No trouble for the MANAGER. There are no complicated parts to get out of repair. The coin always gives the correct signal, which the operator has no trouble in receiving. The public has "no kick coming," and the manager has no trouble in convincing his directors that the "Livermore" pays dividends.

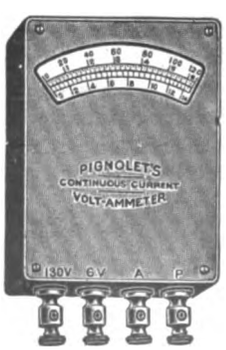
TO BE FOREWARNED IS TO BE FOREARMED



If you are not using a measuring instrument to test your lines, get one at once, as you will need it many times before the summer comes. It would be just as sensible for a grocer to try and sell sugar by guessing at its weight as it is for you to try to locate a fault in a line by the same method. PIGNOLET VOLT-AMMETERS are designed to give the best results required for testing purposes. They are not complicated nor do they require experts to operate them. Another point in their favor is their low cost. There is no instrument on the market which will give you as accurate results at anything near the price. Hadn't you better write for prices and further particulars By buying one now you will save its cost many times over before you have had it a year.

"It might interest you

to know that the total maintenance expense of parts for our entire plant of 3,000 switches for the past eighteen months has been $10.24," writes Supt. J. A. Duncan, of the Sioux City Telephone Company, Sioux City, Iowa. (This company operates our AUTOMATIC TELEPHONE SYSTEM.)

"A like sum

would perhaps take care of the repair cost on operators' chairs in a manual exchange of the same size," adds Mr. Duncan. (We'll be glad to send you a copy of his letter if you'd like to see it.)

It occurs to us

that the one item of switchboard cords alone for a manual exchange of 3,000 lines would amount to at least $150 in eighteen months. That is fifteen times the cost of all repair parts on the Sioux City automatic exchange.

That is only one

of the many economies of the AUTOMATIC SYSTEM. These economies all help to swell the profits. And—the AUTOMATIC, being the best service, commands the highest rates. Low production cost plus high selling price equals big dividends. That is what led to the adoption of the AUTOMATIC TELEPHONE SYSTEM in the following cities:

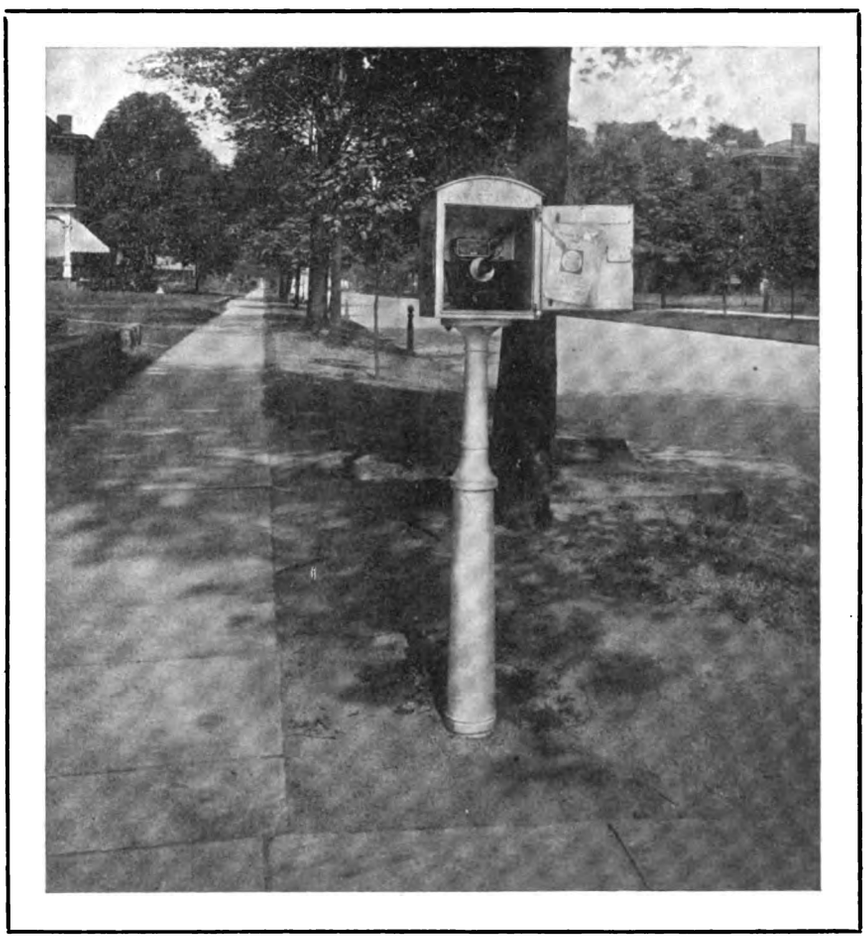
Earning for the Tenant and Paying the Landlord

Why the Coin Collector Pay Station Provides the Highest Revenue Per Station for the Telephone Company, and Helps the Business of the Person who Shelters It.

By O. F. French.

WHEN measured service devices are mentioned, comparatively few telephone men think of the ordinary pay station coin collector. Yet this is in fact at the same time the most common and the simplest apparatus for recording telephone calls, and the stations in which it is placed are in the truest sense of the phrase measured service stations. Business from these stations always partakes somewhat of a special nature. It requires some modification of ordinary methods for handling, and presents features which differentiate it from that done at a regular house or business station, when regarded from any one of several points of view.



Typical Location for an Open Air Coin Collector Pay Station.—This Shows one of the Instruments of the Cuyahoga Telephone Company on a Principal Residental Street in Cleveland.

The business man who installs a coin collector pay station is likely to find it before long assuming a place as one of the most important conveniences in his establishment. While taking up a trifling amount of space, and requiring practically no attention, it is almost sure to bring him a very fair revenue, and sometimes becomes a genuine money saver into the bargain. When a pay station is located in an establishment on a commission basis, the share of the proprietor is in most instances enough to pay for his own telephone service, and in adidtion bring him in a very considerable cash return—all this without his investing a single dollar. The writer recalls that during the year 1905, when he was in Cleveland, there was more than one corner drug store where the proprietor was entitled to between twenty-five and forty dollars a month as his share of receipts from a single station. In these drug stores the value of the telephone pay station as an indirect source of revenue is especially evident. It brings in customers. One of Cleveland's down-town business corners is occupied by a drug store where there is a pay station which in one year was used by more than 30,000 people.

As a money saver the pay station helps the business man in a large place by taking very many calls which, as deadheads over his regular lines, would congest the traffic on these wires, and probably shut off incoming calls, orders, etc., which it would be important for him to receive. It also cuts down considerably the number of unnecessary messages of employees, so that the telephone booth is not made a place for idling. To the small user of service the pay station is a genuine boon, for the receipts from outsiders pay a part, or all of what a private line would cost, and his incoming calls are of course received without charge.

That the pay station is appreciated by the public in general is evidenced by the frequency with which they make use of its facilities when they have an opportunity to do so. Those who want figures will be interested to learn that in nearly every one of a thousand pay stations of the Independent company of Cleveland the average revenue was observed to be greater than that of the individual

Digitized by Google

business line. By this is meant the revenue derived from local calls only; long distance receipts being also a large item of income.

The public naturally turns to the pay station when occasion demands, as it affords ready access in cases of emergency to physicians, ambulance, fire and police departments. Especially is this so in the case of street corner pay stations, located as they are, or should be, in the residential districts where it is not possible on account of lack of business places to locate a pay station in a building where it will be accessible to everyone.

There are many points to be observed in connection with the operating features of the ordinary devices now being used for coin collectors. They may be divided into two general classes: those the operation of which is strictly mechanical, and those electrically operated.

The mechanically operated devices may be sub-divided into two kinds, the gravity type and the lever type; the electrical devices being also separated into two types, gravity and prepayment. The electrical gravity type need not be considered, as it is practically out of the market to-day.

As with any device there are advantages and disadvantages in the use of instruments in each of these classes. A few, as verified by the writer's experience, will be enumerated here and the reader can compare them with his own opinions. The only advantage claimed for the prepayment coin collector is that it reduces the drag on the operator, consequently insuring more rapid service and a lower cost per message for operating, the coin being deposited by the patron before he is able to get the operator's attention. The operator is therefore consuming no time in instructing the patron to drop the coin. Assuming that the prepayment device operator handles the same amount of traffic as the unlimited service operator, she will handle about one-third more calls than the pay station operator having any other type of equipment.

On the other hand this device requires a ground at the subscriber's station, which in the larger cities, on account of electrical disturbance and sneak currents, is objectionable.

In case of the prepayment line being out of order, the patron not knowing this to be so will deposit a coin which may not be returned to him, as the operator who controls the returning device has no knowledge of the event. The use of this device is also a source of annoyance in the case of an emergency when it is desired to get an ambulance, or get into communication with police or fire departments, and the user has no coin of the right denomination available. With any other type of coin collector the operator will put the call through immediately without question, for with most companies such emergency calls are handled free of charge, as they should be.

The remaining collectors are those under the mechanical classification, or in other words, the lever and gravity types.

In case of the coin collector having slides, levers, dash pots and springs, the possibility of fraudulent use of the machine is minimized as compared to the gravity types. On the other hand the employment of these extra parts brings complications with a consequent liability to higher maintenance charges, and what is more disadvantageous to the company a loss in revenue and confidence of the public because of the device being occasionally out of order unless the mechanical construction is up to the very highest attainable standard.

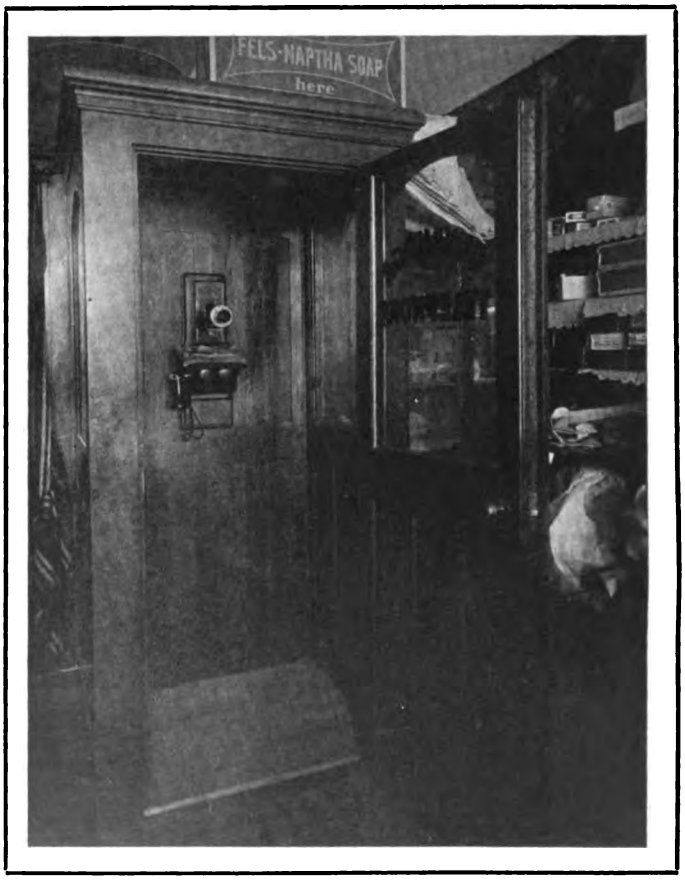
The advisability of the use of magnetic slug deflectors, coin rejector pockets, and flippers to insure against depositing more than one coin at a time, is a question which should be determined by the actual necessity for their use. Any of these parts are liable to get out of order and should not be used unless absolutely necessary. In the writer's experience this has been only so in cases where pay stations are located in out-of-the-way places, the cheaper class of saloons, etc. It is seldom that a patron will deposit a coin in the wrong slot. In fact this happened so infrequently in Cleveland (and then only in the case of poorly lighted booths) that the rejector pocket was not found to be a necessary adjunct to the coin collector. The solution of this would be to properly light the booth. Such should be the case in any event.

With the gravity coin collector the flipper is not necessary, for it is hardly possible that the patron would drop coins in two slots at the same time. The value of the gravity device lies in its simplicity. It has no moving parts and consequently a minimum of trouble. Its operation is easily learned by the patron, as it is similar to practically all other slot devices. Operators claim in case of the lever or push slide types of devices that too much of their time is taken up in instructing subscribers in the use of the machine.

Now as to the number of slots. Out of Cleveland, in 1905 with a population of nearly a half million, only eleven per cent of long distance calls were of fifty cents and above in amount, the dollar messages being but a fraction of one per cent. This would seem to indicate that the dollar slot is entirely unnecessary and it is a question as to the necessity of the half dollar slot. There is no doubt that for the eleven per cent of half dollar calls at least one half the tolls were deposited in coins of less than fifty cents in denomination, and it would be quite possible in the balance of messages to get coins of less than half dollar denominations.

The pay station operator's equipment should consist of a double key in each cord circuit, making it possible for her to talk with the subscriber at either end of the line without the knowledge of the other, and with both subscribers at once. It is annoying to the stalled subscriber to hear the operator notify the calling subscriber to drop the coin.

As a busy pay station operator will have on the average about ten cord circuits in use at one time, she should have means of ascertaining when the period of time for conversation allowed the subscriber for the price of one coin is ended. As it is physically impossible for an operator to keep track of each of ten connections, she will give the patron the benefit of the doubt, and as a consequence the calls instead of not running



Single Booth, with Coin Collector Pay Station, Located in a Corner of a Small Store.

over, say, five minute periods, will average more; for this surplus the company of course derives no revenue. It is probable

Digitized by Google

that a satisfactory plan for doing away with this difficulty will eventually be worked out.

To the telephone company the pay station is especially advantageous, as compared with the private station, in a number of important ways. In the first place it is an excellent medium for advertising the service, as one or more standard toll signs may be installed in connection with each pay station. All pay stations should be equipped with one or more of these signs, placed on the front of the building or on a pole near the building, together with a framed transparent glass sign in the front window. In the more desirable locations properly lighted and ventilated booths should be installed.

In the matter of service it is important that the attention given by operators to public pay stations be of the very best. Such service is considered as the company's standard and will have good or poor effect as the case may be in the mind of the public. Public pay stations should be on individual lines, as it is found that party line service in this connection is unsatisfactory. With good service there can be no better advertisement than a pay station. Every time a non-subscriber uses the instrument he has an object lesson as to the advantages of telephone service which in time results in many applications for telephones.

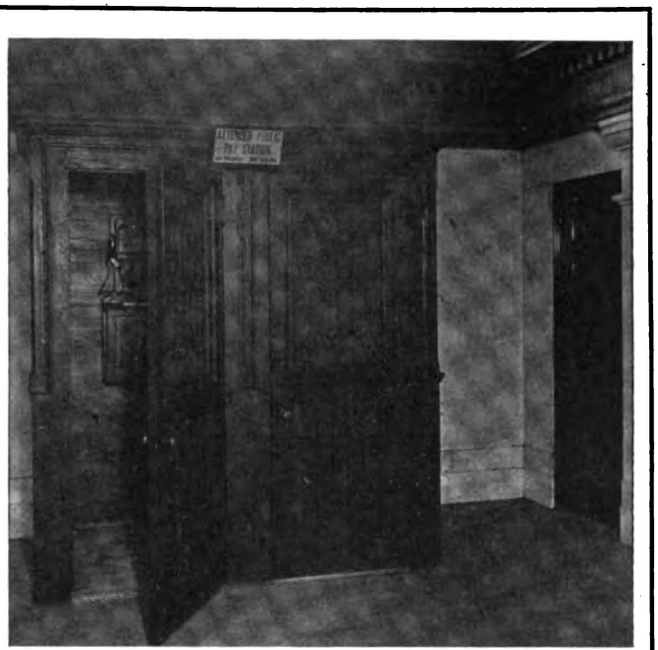
As stated above the pay station greatly aids in the giving of good service by taking care of the deadhead calls, a feature which is to the subscriber's advantage and also beneficial to the telephone company. If for no other reason the pay station is a great advantage to the company in that it gives nothing but measured service. There is no doubt but that at some future, and it is hoped early date, this class of service in business houses especially will be the only kind furnished by any telephone company. Telephone managements are awakening to the fact that to handle a telephone call and connection costs money, and that the cost increases with the traffic. The only recourse now in case of unlimited service is to raise the rates, which is a most unsatisfactory procedure from both the subscriber's and the company's standpoints; but that is another story, as Kipling would say. The fact remains that the pay station coin collector is one of two well known types of instruments for measuring telephone service, and in the writer's opinion is the more practical one. With the coin collector, as in the case of street railway traffic, the revenue is secured in advance, thus insuring against bad debts and disputes as to correctness of the bill, which would necessarily have to be presented in case the coin collector was not used, but in its stead a meter.

In order to establish pay station service, telephone companies usually enter into contract agreements with subscribers, of which agreements at least two distinct forms are good. In one the company allows the subscriber as his commission a certain percentage of the local and long distance receipts over and above a stipulated amount per month; say $6.00. In case the deposits for the month do not amount to $6.00 the subscriber is to make up the deficit upon demand.

The other arrangement, which with the better class of pay station subscribers the writer has found advantageous, is the so called "code word" agreement. The subscriber is rendered a bill quarterly in advance at the rate of, say, $6.00 a month for the incoming and outgoing calls to himself and clerks, who are not required to deposit a coin if the individual code word is repeated to the operator. Outsiders are required to deposit tolls, and the subscriber is allowed a certain percentage of all coin collections as his commission. The latter arrangement has been a better earner for the telephone company but has the disadvantage that the code word may be divulged to outsiders. The writer does not recall any instance where this form of deception has been practiced to any extent.

In some instances where a contract could not be entered into with the proprietor and where the pay station soliciting agent was practically certain that the location was a good one, pay stations have been installed without any guarantee on the part of the proprietor, the company taking the entire receipts of the coin collector, only giving the proprietor the benefit of incoming calls.

All these separate considerations, bringing out advantages to



Attractively Designed and Arranged Booths in Lobby of a Large Office Building.

everyone concerned, show that to-day no public place is completely equipped for the convenience of people who visit it without the telephone pay station. For instance, at such points as the following: hotels, lobbies of large public buildings, large retail stores, drug stores, summer amusement resorts, the higher class of cafes and restaurants, railroad stations, prominent residence street corners, etc., should always be equipped with such instruments. In the business district the shopping public finds it a great convenience in calling the home and other stores.

In four large department stores in Cleveland the writer's notes show that each coin collector averaged about $25.00 a month; six down town hotels, $55.00 a month; five office building lobbies, $15.00 a month; eight down town drug stores, $36.00 a month; six prominent cafes, $24.75 a month; ten railroad stations, $25.50 a month; and the receipts of the opposition company probably run about as much. These figures bring out clearly the strongest point—namely, that from the viewpoint of the telephone company the best argument in favor of the pay station is that the net revenue it brings in is greater than that derived from any other class of service.

ATTEMPT TO PREVENT INDEPENDENT COMPANY FROM BUILDING IN TENNESSEE HIGHWAYS.

SUIT was brought in Nashville, Tenn., recently to test the new law passed by the state legislature last winter relative to rights-of-way for telephone and telegraph companies. The Independent company, which is constructing a line from Louisville to New Orleans, is the object of the attack. W. B. Marr, a member of the House of Representatives of Tennessee, who was bitterly opposed to the law declaring telephone companies public service corporations and granting them rights-of-way over roads and streets without the consent of the authorities, is the complainant.

Mr. Marr in the first place filed one suit to enjoin the secretary of state from issuing a charter to the Home company, but this failed. He now sues as a citizen of Davidson county, charging that the company has no right on the public highways until granted specific authority by the county court. The Cumberland Telephone & Telegraph Company is said, on reliable authority, to be back of the fight, which is simply another malicious obstacle intended to hamper the Independents.

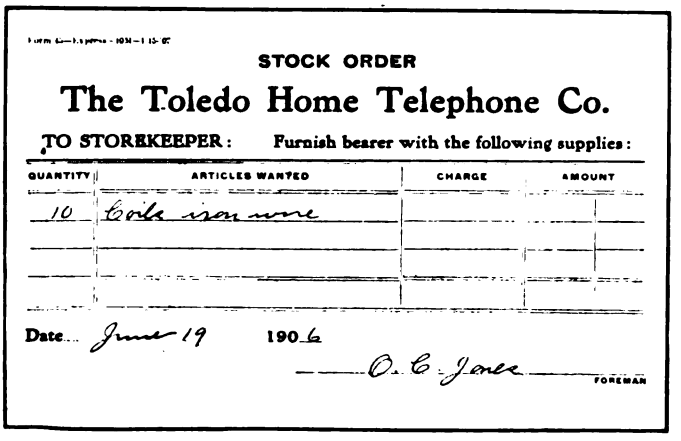
Managing a Telephone Company's Supply Department*

By M. R. Tracy, Storekeeper for the Toledo Home Telephone Company, Toledo, O.

NOW, as to *outgoing* material. The foreman gives a stock order for what he wants. It should be specific and state just what and how much is wanted. The storekeeper must make it a rule never to accept an order that needs oral "explaining." The writer tells the men that he cannot record wind. The weather bureau does that.

This stock order (Fig. 16) is *dated* and posted to the card for that material and the date on the card coincides with the order date. At the end of the month all the material on this card is totaled and appears in the typewritten monthly report.



STOCK ORDER

The Toledo Home Telephone Co.

TO STOREKEEPER: Furnish bearer with the following supplies:

QUANTITY	ARTICLES WANTED	CHARGE	AMOUNT
10	Coils iron wire		

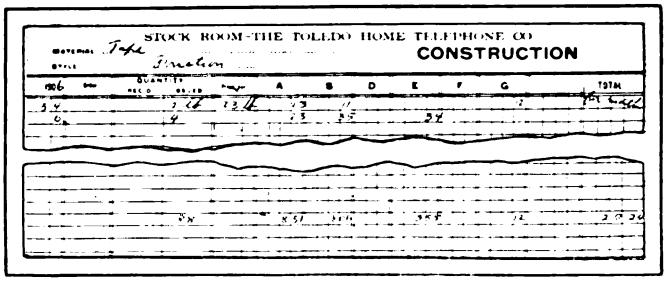
Date June 19 1906

O. C. Jones FOREMAN

Fig. 16. Sample stock order—not accepted because it does not state what kind of wire (whether No. 10, No. 12, etc.) is wanted.

By having the cards ruled in columns and the columns headed A, B, C, D, E, F, etc., it is made possible enter the quantity in the "quantity" column, the price in "price" column, and the amount under the letter designating the distribution. Each day items are posted from stock orders, of whatever kind or form used, the quantity of each kind of material issued during the day to the card for that kind of goods; crossarms to "crossarm" card, insulators to "insulator" card, etc. In a large plant this may require a thousand cards. At the end of the month the several distributions are footed and the total carried to the total column. The cards often show material issued to several distributions; something like the sample card shown in Fig. 17.

This shows that in May the department issued 88 pounds of friction tape at 23 cents per pound. Of this $8.51 was for pole line construction, $8.06 for cable construction, $3.55 for installing telephones, and 12 cents for installing private branch exchanges. Total, $20.24. Now, having every item posted from the stock orders to the daily cards, and these cards all footed and totals carried out, the next step is the monthly report to the auditor. The manager also receives a copy and the storekeeper keeps one.



STOCK ROOM-THE TOLEDO HOME TELEPHONE CO

CONSTRUCTION

Fig. 17. Sample material card, showing quantity of friction tape issued on each date and amount chargeable to each department which drew it (indicated by letters.)

These often cover several type-written pages; each line is a copy of the footings of one of the daily cards.

The following shows the business done in friction tape for the month:

Description.	Quantity.	Price.	Distr.	Distr.	Total.
Tape, Friction....	88 lbs.	.23	$8.51 A	$8.06 B	
			3.55 E	.12 G	$20.24

It will, of course, be alphabetical. Maintenance is treated in the same manner.

The next step is to get the totals of items charged to each distribution and the total of these totals will of course equal the grand total of construction and maintenance, respectively.

This report also shows the material returned to the warehouse, such as telephones discontinued, transmitters repaired, etc.

Now, if the manager thinks too much copper wire has been used during the month and wants to know about it, the Supply Department proceeds about as follows: The daily card shows that on the 10th the department issued one thousand pounds. The stock orders are filed as to the date and on looking up those for the tenth it is found that Mr. Jones ordered seven hundred and fifty pounds; Mr. Smith, seventy-five pounds, and so on through the day. The "work orders" on file in the Record Department show that Mr. Jones was ordered to "string copper wire in Locust street," his "work report" shows that he "strung one hundred and twelve spans of copper in Locust street." This may cover several days' work, but it gives the desired information, and the information can be verified, for the wire is there to show for it.

The first link in the chain is the *Requisition;* the second is the

Fig. 18. Copy of invoice to auditor covering material issued to outside parties for which the warehouse should receive credit.

carbon copy of the *Purchasing order,* both having the same serial number; the third link is quantity received as shown on *daily record cards,* also showing serial number of purchasing order; then follows the *Stock order,* showing date and quantity issued; and finally the *Work order* and *Work report.*

There is another class of outgoing material to be accounted for, viz., "Sold to Outside Parties."

The manager may decide to sell some material to an individual or a friendly company and give a stock order for that amount of goods. Now, how is the storekeeper to charge this out?

It is not a construction account, for it does not go into the plant as an integral factor. The other side of the card is Maintenance, but that affords no relief, for the material is not used to repair waste places. There is no place on the cards for this entry and yet the material is gone and the warehouse must have credit. The manager could report the sale to the auditor and the auditor then give the warehouse credit through the invoice journal. Here, however, one encounters another difficulty. These goods are sold at a profit and the auditor does not know how much credit to give the warehouse.

*Continued from issues of June 1 and June 15.

Digitized by Google

If he credits it the full amount, the card for that material will not balance; it will show more value given out than was received; or the manager may have sold some material that is already charged out as Special Equipment or Incidentals. These difficulties disappear if the storekeeper certifies it to the auditor and he in turn bills it through the invoice journal.

When the storekeeper certifies it to the auditor he shows the amount of credit due the warehouse and also the amount of miscellaneous earnings (profit) and any other distribution.

In Fig. 18 is reproduced a carbon copy of the invoice to the auditor, which the storekeeper retains. On this he notes (at the right) the amount of credit he wants the warehouse to receive. The bridle wire costs $11.50 per thousand and therefore the warehouse gets credit for only $12.65. The diaphragms have already been charged out as "Incidentals," but as they cost only 1½ cents each there is a profit (Miscellaneous Earnings) on these two items of $2.92. The lead is junk and does not enter into warehouse accounts at all. These items appear in the storekeeper's report as "Issued to Outside Parties," but are not yet a warehouse credit; not until the credit comes back to him through the invoice journal.

There is a large amount of material received into the warehouse that is not and should not be charged to the warehouse account. The first thing in this class which the writer would mention is junk, such as pieces of cable, scrap copper wire, etc. This is stored as it accumulates and when sold is credited to construction. There is no warehouse account at all. It is a part of the warehouse, of course, but not a part of the warehouse accounts. The storekeeper has to distinguish constantly between himself as a warehouse foreman and as a bookkeeper. Another class of material that is carried as material but not accounted for is defective maintenance material, such as defective transmitters, defective receivers, etc.

When a transmitter becomes defective it is replaced with a new one, and the new one charged to maintenance account. Now, if one knew how much it would cost to repair that transmitter he might credit it in at the net value, but the next one might

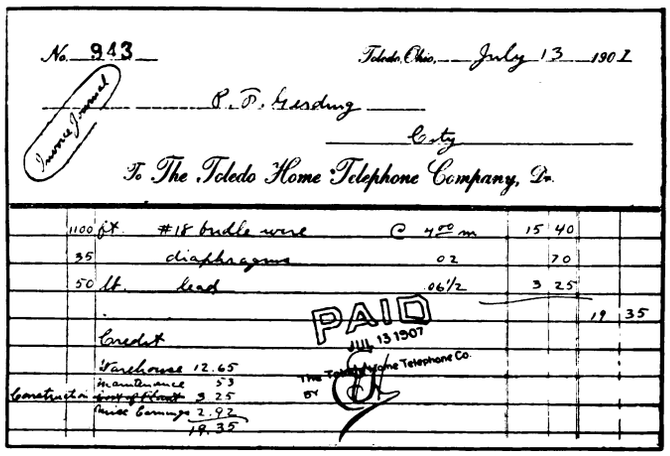

Fig. 19. Invoice journal entries covering same material recorded in form reproduced in Fig. 18, showing distribution of receipts amongst four accounts.

be of a different value and some estimated at a certain value might be absolutely worthless when they reach the factory. The better way is to store them until a supply accumulates and then send them to the factory.

The transportation and repairs are charged to maintenance account, and then the repaired material is charged to the warehouse as "Received from Maintenance" in the monthly report. It is now an asset of the company.

(To be continued.)

Experiments With Concrete Poles*

By G. A. Cellar.

A POLE for the support of wires may be defined as a column, fulfilling in this purpose support against downward pressure; also a beam, fixed at one end and loaded at the other. In its capacity as a support for wires it is subjected to pressures downward and laterally and to more or less of torsion. But to fulfill the requirements for such a support as this necessitates a medium having, first, a moderate strength against compression; second, a superior resiliency, and, third, long life in contact with the soil.

In the first days of the telegraph the pole of wood was found to be far the cheapest medium for use in the support of wires, and in the earlier days of the telegraph and later of the telephone and electric light and power many different varieties of wood were used, varying with the native product of the different sections of the country as that product met requirements for resistance to destructive agencies encountered in the different localities. These requirements were found in greater or less perfection in the native timbers in many parts of the country or in timbers that required transportation for only a short distance.

The action of the ingredients of the various soils is largely responsible for the shortening of life of the timbers in contact therewith. Consequently in some soils timbers will deteriorate very much more rapidly than in others and vice versa. Therefore the use of timbers, especially those that are native or whose habitat is reasonably near to the place where they are to be used, is consistent with the greatest economy.

The arbor-vitae, or northern cedar (Thuja Occidentalis) combines reasonable strength with resiliency and with the almost ideal tapering form necessary to afford the maximum strength at the point of greatest pressure under varied stresses, viz.: the ground and water line. This has accordingly been for many years the generally accepted and generally used timber for telegraph, telephone, light and power lines throughout the country where the transportation charges would not so add to the initial cost as to make the total prohibitive or exceed the cost of some only slightly inferior native timber.

Throughout the Middle East, parts of the Ohio Valley and in other localities the chestnut is plentiful and has quite a long life in contact with the soil. Its form is not nearly so perfect as the white cedar, but it far exceeds the latter in strength to withstand lateral stresses, although its length of life is inferior to that of the cedar except perhaps in the regions where native.

On the Pacific coast sawed red wood poles have been and are still in use and in Mexico various timbers are utilized, the process being to cut a piece of timber with rectangular section diagonally along its broader side from near one side at the one end to near the other side at the other end, making of such section two poles, each of large base and small top. This form of support has also been used in the construction of steel supports by halving I beams in the same manner.

The northern cedar as a proposition for the supply of the immensely extended telegraph, telephone, light and power lines has passed the safety line as a resource. The western cedar, of which there are immense quantities, is so far away from us that the transportation charges make the price per pole almost prohibitive for ordinary purposes. The chestnut, considered as a supply for its native region, is to be depended upon for the immediate future, but is sadly inadequate as a supply for the whole country. Therefore the mind instinctively turns to a manufactured article which shall take the place of the natural, and the logical time when the manufactured product shall so take the place of the natural is when the former can be produced as cheaply as the latter.

(Continued on page 417.)

*Abstract from a paper presented at the Association of Railway Telegraph Superintendents, Atlantic City, N. J., June 19. Mr. Cellar is Superintendent of Telegraph, Pennsylvania lines west of Pittsburg.

From the Editor's Viewpoint

A TOPIC FOR DISCUSSION.

BEFORE they undertake any extensive amount of construction, telephone companies everywhere are at the present time figuring the cost, and also the possible returns, very carefully. Probably more attention is being given to these matters by many companies during the present year than at any previous time in their experience. Whatever may be the assigned reason for the necessity for watching new work with exceptional care, be it the high cost of copper, or the natural increase in cost per line with the extension of the system, there does not seem to be any such occasion for distress at the existing situation as is observed in some quarters. In fact, it is probable that many companies will practically be forced into giving more careful attention than they have done to a line of investigation which will bring them distinct benefits.

There is probably not an exchange in the country where the manager himself, or any competent construction engineer, could not go about and point out many inconsistencies which increase the fixed charges on each subscriber's line, or which, if recognized, would compel special financial arrangements in order to make up for past deficiencies by providing an increased surplus for future reconstruction. Among those which might be noted particularly in the distribution system, for example, are improper adjustment of the ratio of conduits, number and size of cables, total number of cable conductors, etc., to present requirements of development, and those estimated for the future; lack of consideration of the life of material in relation to present installations and future development, and various other details which in the aggregate stand for a considerable useless expenditure of money, which is a constant drain on the resources of the company. In a business where methods of manufacture, engineering and construction are being improved upon as rapidly as they are in the telephone field, and where, moreover, the adjustment of construction to development is dependent upon two variables so difficult to estimate as the increase in population and the proportion of telephone users to persons in a given district at a given time, it is inevitable that these inconsistencies should have occurred, and extremely probable that they will continue to do so as long as a wire plant is used for the transmission of speech. The thing to be done in order to reduce to the lowest terms the drag which they exert upon the company's profits is: First, to reduce the number of such inconsistencies; and, in the second place, to endeavor to fix upon at least certain standard methods of procedure in making studies for future development, and to adhere to them so closely, as long as they appear to be reasonably true to real conditions, that whatever variations occur may be not only few in number, but involve a minimum departure from ideal conditions.

In conventions, and other gatherings of telephone men, a great deal of attention is given to the matters most obviously relating to the financial requirements of the business, such as the basis for division of receipts on interchanged business, collections, getting new business, etc. In few of these meetings does anyone show by bringing forward a carefully studied paper, or even by an informal talk, that he realized that methods of arranging the development and distribution of the plant, in relation to the future growth, exert so great an influence upon future profits as is in fact the case. Managers must learn to figure in dollars and cents just what the results of adopting a certain type of construction will be five, ten or twenty years from now, and in making up these cost estimates get results on which they will be willing to stake their reputations.

The transmission of speech is a permanent public necessity and to carry on the business arrangements of a telephone company on a basis which will be permanently economical is also a necessity which will in the future be felt with ever increasing force by those to whom this duty is entrusted. It is safe to predict that some years hence those sections of the country where the most consideration has been given by individuals and groups of telephone men when they have met for practical conferences, to this question of economical distribution will have the plants paying the best dividends.

CONCRETE POLES.

TELEPHONE men are undoubtedly much interested in such progress as has been made in the development of concrete poles which will have, to paraphrase Mr. Cellar's optimistic words which appeared in his admirable paper presented at the Convention of Railway Telegraph Superintendents, a life of infinite duration. Up to the present time such interest as has been felt seems to have led to no very practical results, those who have made experiments apparently being rather diffident about expressing an opinion in favor of the concrete pole for telephone use, and equally reluctant to condemn it.

Probably one reason for the lack of enthusiasm for this particular line of research has been due to the fact that those who have considered the subject have foreseen certain inconvenient features conected with the practical handling of concrete poles after they have been built. These have seemed to take the position of prime importance, and any consideration as to the relation between their first cost and that of wooden poles, installed on a typical telephone line, and the relative life of the two types, has been put aside, no one having taken pains to acquire definite and reliable data. The difficulties referred to as applicable to railway telegraph lines are mentioned by Mr. Cellar, but the conditions prevailing in railway practice make his conclusions of doubtful application to telephone systems. For example, there can be no comparison between the method of distributing poles over a railway line, using a locomotive and cars, and their distribution over a country highway, having the usual variation of grades and surfaces, so as to make any general conclusions as to cost utterly impossible of attainment. On account of this fundamental difference in transportation conditions, telephone men will have to investigate for themselves, and discover, if possible, some method of economically manufacturing concrete poles near the place where they are to be used, or a method of transporting and handling finished poles, made in quantities at a convenient point, which will not be too costly to offset the advantages gained by their increased life. In cases where studies prove neither of these methods to be economical for country lines, the use of concrete poles would seem to be restricted to cities and towns. Here, again, comes the question as to the real advantage to be gained by their use. In well constructed telephone systems no open wire is used in business and thickly settled residential districts, so that poles are only used for supporting leads of aerial cable. This type of construction is being gradually supplanted by cable run in underground conduits. Even if it could be assumed that poles erected to-day for carrying aerial cable would be sufficiently valuable to pay for their removal and relocation in places as yet unknown, at a time when the aerial cable is to be replaced by underground cable, it would be advisable to make a very careful study of the probable comparative costs, including fixed charges for an extended period, before actually locating the poles.

These points are brought up by the features of Mr. Cellar's paper which do not strictly relate to telephone practice. On the other hand, the carefully arranged general discussion of the subject, and more particularly the part of his paper which will be published in our next issue, showing the results of tests which he has made to determine the comparative resistance of concrete and wooden poles to a horizontal stress, will have a decidedly positive value to all of those interested in the use of poles as supports for wires. From whatever point of view one is disposed to consider it, the present paper is a very valuable contribution to existing literature on wire supporting devices, and should exert a decidedly stimulating influence upon those who have had it in mind to take up other investigations along this line.

Legal Snares Untangled

CONDUCTED BY A. H. McMILLAN.

RELATIVE RIGHT OF TELEPHONE AND TROLLEY COMPANIES.

A trolley company now stringing its high tension wires parallels a grounded telephone lead of seventy wires for a distance of five blocks on the opposite side of a sixty-foot street. When the city granted a franchise to the trolley company it provided that if the construction or operation of the road required the alteration or rebuilding of any telephone line, the expense must be borne by the trolley company.

If the trolley company refuses to comply on the ground that the city, not being financially interested in either trolley or telephone company, cannot interfere to protect the rights of one as against the other, can the telephone company enforce collection of said expense by suit? If not, can the telephone company require the railway company to make its line metallic so as to avert the induction which is sure to follow, and interfere with the proper and satisfactory service over the telephone lines? Will an injunction lie to prevent the trolley company from applying current or operating cars until circuits are made metallic? J. W. W.

IF, under the circumstances you state, the city cannot or does not interfere to protect the rights of the telephone company, the telephone company can, itself, by force, enforce collection of the expenses it has been put to by the alteration or rebuilding of its lines. It might also require the railway company to make the telephone lines metallic, so as to avert interference by induction, and injunction will lie to prevent the trolley company from turning on its current, or operating its cars until the required action has been taken.

FRANCHISE IN KANSAS.

(1) When a telephone company gets a franchise to build and operate a certain type of telephone exchange in a city, and after built is not a success and is torn out, and a different system built instead, is the franchise good, when it first tells the kind of system, as stated above, and never has been changed; it commenced to put in the exchange some ten years ago and was chartered since the franchise was granted.

(2) This same company was granted the privilege of building on any and all the streets, including main; was also granted an exclusive franchise in the city for telephone purposes. Can the City Council keep other telephone companies (incorporated) off of the streets, except just to cross them, and still let the first company maintain its poles and wires, and keep on building on the streets?

(3) Can a City Council grant privileges to one telephone company and debar any other company from the same privileges?

(4) In a city of the third class, under the laws of Kansas, can a telephone company build and maintain lines on any street except the main street? S. S. McE.

THE above questions will be answered in the order in which they are asked, the numbers of the answers corresponding to the numbers of the queries.

(1) The laws of Kansas provide that telephone companies have the same powers and are subject to the liabilities and duties of telegraph companies (General Statutes, 1901, Sec. 1252). It is provided that telegraph companies (and consequently telephone companies) may set their poles, etc., along, upon and across any of the public roads, streets and waters of the State, so as not to incommode the public in the use of them. (Section 1342.) The power is given to the council of any city or the trustees of any incorporated town or village to specify by ordinance or otherwise where poles, etc., shall be located, the kind to be used, the height at which wires may be run; and the council may direct any alteration in the line or the height of wires, first giving the company the right to be heard. (Section 1346.)

It will be seen from the above provisions of the Kansas laws that a telephone company has the right to build its line in the public streets, irrespective of the permission of the local authorities, the power of the latter being limited to specifying where the posts shall be set, the kind of post to be used, and the height at which wires are to be run. The city council, therefore, had no power to prescribe what sort of exchange should be installed and its requirement in this respect is without effect. The failure of the company to comply with the requirement as to the kind of exchange would not invalidate the rest of the franchise, and the ordinance granting a franchise would be valid permission to the company to occupy the streets designated.

(2) The city council, under the above quoted provisions of the State law, has no authority to keep other companies, whether incorporated or not, off the streets. Other companies could compel the council by mandamus to designate the streets to be used, the kind of poles to be set, and the height at which wires are to be run. The exclusive feature of the company's franchise is of no avail as exclusive franchises are not favored by the law, and are invalid unless the city council has express authority granted it from the legislature to make franchises exclusive.

(3) A city council may grant to one telephone company privileges which it denies to another.

(4) In a city of the third class, under the laws of Kansas, a telephone company may build and maintain its lines in any street specified by the city council.

STRINGENT MEASURES TO PREVENT USE OF LINE BY NON-SUBSCRIBER.

AT Macon, Ga., a suit for an injunction to restrain Ernest Thorpe and several others from molesting a telephone line, of which the plaintiff was a joint owner, disclosed a remarkable system of dealing with a non-subscriber who insisted on using the line. C. R. Hancock, the plaintiff, alleges that the defendants became involved in a controversy with one C. L. Bateman, who was not a party to either of the agreements, and was wholly a stranger so far as having any interest in or rights with reference to the telephone line was concerned; that defendants claimed that Bateman, while not contributing to the construction of the line, had used it by going to petitioner's store for that purpose at times and by going to Byron and other points; that defendants presented Bateman with a bill for one-half the cost of construction of line, which Bateman refused to pay, and upon his refusal, in order to prevent Bateman from using the line, cut the line about a half mile from petitioner's house, using a file or some other sharp instrument to accomplish the act.

Hancock is of the opinion that if he should mend the wire the defendants would again cut it, it being averred that they have so declared their intention and wishes to have such action forestalled by order of the court.

RIGHT TO USE STREETS OF CITY INCLUDES RIGHT TO LAY CONDUITS.

A RECENT case has decided that an electric company having a right to use the streets of a city can lay its conduits under the sidewalks, they being parts of the streets. The case arose upon a suit for an injunction to restrain the property owner and his contractors, who were making an excavation under a sidewalk in the city of Pittsburg, from interfering with the conduit property of the complainant. The company claimed a vested right to maintain the conduit under the sidewalk, and this right was denied by the defendants. The company had municipal consent "to enter upon any public street, lane, alley or highway" within the city of Pittsburg for the purpose of carrying on its business.

The court held the permission from the city to include sidewalks, which are parts of the streets. There was also included in the grant of authority the right "to alter, inspect and repair its system of distribution." The court held that the company in placing its conduits under the sidewalk was simply altering its system of distribution, and in doing so exercised a right with which a city could not interfere unless, in the exercise of it, there was a violation of reasonable police regulations adopted by the city for the protection of persons and property from danger. The court reversed the decree dismissing the bill of complaint and granted an injunction. Alleghany County Light Co. vs. Booth (Pa.), 66 A., 72.

EXPERIMENTS WITH CONCRETE POLES.

(*Continued from page 414.*)

Into the question of cost enters that of length of pole life. Heretofore the advisability of using wood preservative to reduce or prevent the decay of the wooden poles has been considered from time to time, but the practice has not been universally established because

(1) The pole prices have been very low.

(2) The increased life has not been found to be commensurate with the additional expense of treating the pole in its entirety.

(3) In the building of many lines the outlook has contemplated only moderate increases in facilities, whereas in many instances time has demonstrated that very much larger poles sooner or later become necessary, and therefore the process of deterioration only serves to take down many small lines that would have to be taken down anyhow, in order to make room for larger capacity poles.

The principal point of decay in wooden poles is at the ground and air line, where the alternate drying and dampening induces a condition of decay which grows and grows and frays away the body of the pole until it is so weakened that it has to be reset or replaced. On the lines of railroad along which a great proportion of the telegraph lines of the country are located the unoccupied portions of the rights of way are kept in turf, with a view to presenting the best possible appearance, and, consequently are subject to grass fires, especially in dry seasons, which are dangerous to standing dead timber, particularly to telegraph poles where the decayed portion at the ground line has become like tinder. Were it not for the increased liability to ignition the application of coal tar to the poles for a sufficient distance above and below the ground and air line to resist the inroads of decay would materially lengthen the life of the pole. While this process is all right in sandy, desert countries the grass fires in other territory preclude its general use.

Having the solution of the question of pole preservation much at heart, the writer, through the courtesy of the gentlemen of the engineering department of the Pennsylvania lines west of Pittsburg, some years ago made some rather comprehensive investigations into the matter of a preservative best suited for telegraph pole uses, and, casting aside the proposition to treat the whole pole as too expensive in proportion to the benefit thus derived, we decided (on account of the short time until certain construction work had to be started) to undertake a compromise by applying the preservative only to that portion of the pole extending one and a half to two feet on either side of the ground and air line. That the result justified the expense is borne out by the present condition of the poles so treated as well as by the result of the experiments by the Forest Service, Department of Agriculture, shown in the report by Mr. Henry Grinnell, assistant forest inspector (reprinted from the Year Book of the Department of Agriculture for 1905), on prolonging the life of telephone poles and describing the experiments in several methods of treatment from which he adduced the conclusion that, while the lapse of time since the applications were made had not been sufficient for a full report, the method of treatment, consisting of applying the preservative to the pole by brushes, was so cheap that it would certainly repay its cost by an increase of only eight months in the life of the pole. I had not until recently seen this report and did not know of the experiments, but, confirming as it did the results of my own trials, I feel encouraged to think that under present price conditions so long as we continue to use poles of wood we shall certainly find in the increased life of the pole ample remuneration for similar treatment with any good preservative preparation and especially one having decided antiseptic qualities.

The foregoing tends to show that the comparative price of the native woods with that of the manufactured pole is subject to considerable of a sliding scale as the life of the wooden pole is of short duration as compared with the estimated life which a manufactured article of perfect proportions should have.

In looking to a product which shall be the acme of structural possibility the object will be to secure an architectural fabric that will last forever and a Pittsburger instinctively feels that the first and best medium for the manufactured article will be steel. But consideration develops that the length of life of steel, without adequate preservative agencies, is not much greater than the long-lived woods. A great many patterns of steel poles have been made, but probably very few of them represent our practical desideratum. A careful and thorough study of the matter brings the conclusion that, to have sufficient long life for consideration, the inside as well as the outside of any steel pole open to the air must be accessible for the purpose of inspection and reapplication of preservatives.

So far as the writer has ascertained the preservation of steel imbedded in properly constructed concrete is perfect. Concrete not only does not disintegrate, but hardens and improves with age. Therefore a structure of reinforced concrete has a life that is practically unlimited and a telegraph pole made of reinforced concrete ought for many generations to endure and answer the purpose for which it is erected. The location of pole lines along railroad rights of way will in the future permit the use of shorter poles for supporting the wires nearer the ground than has been practicable heretofore because the rights of way of the railroads are better policed now than in the past and in the future will be much more safely guarded. The time will soon come when persons not employed on the railroads or whose duties do not require them to be on railroad property will not be allowed on the rights of way of any railroad company. In England and on the Continent, where trespassing is not permitted, it is the practice to use very much shorter poles.

The use of concrete for the manufacture of telegraph poles is not new. As nearly as I have been able to ascertain, the first concrete poles were designed by Col. G. M. Totten, chief engineer of the Panama Railroad Company, at a date uncertain but probably about 1856, the road having been put into operation in that year. These poles were cone-shaped, twelve feet long, with a diameter of from twelve to fifteen inches at the base and from six to eight inches at the top. The wires were supported by iron brackets, which were fastened to the poles by wrought iron bands passing around them and around the poles near the top. The proportions of the ingredients used in the manufacture of these poles is not obtainable, but the strength to resist strains was so inadequate that means were sought to overcome this fault, and the poles were a few years later replaced from time to time by the first reinforced concrete poles of which record is known, the reinforcement consisting of 3″ x 3″ pine cores, extending throughout the length of the poles. The concrete poles, it is understood, were used because the available wooden poles were very short-lived by reason of the ravages of insects. The poles with wooden reinforcement evidently were not attacked by the ants soon enough to prevent the cores from swelling and cracking the concrete so that the first pattern of reinforced poles was not an appreciable improvement over the solid pole. After being used for a few years the disruption of both classes of poles was such that they were practically abandoned, they having been replaced as occasion required by other patterns until, in 1888, there were only about twenty of the original poles standing, one or two of which still remain erect on the line of that road.

(*To be Continued.*)

TURKEY TO INSTALL TELEPHONES IN THE LARGER CITIES.

REPORTS from Beirut by United States Consul-General G. B. Ravndal state that the prohibition upon the use of electricity which formerly prevented the introduction of telephones into Turkey has recently been removed. Under the new conditions it is likely that concessions for telephone systems will soon be granted in at least the larger cities. It is said that as yet the Ottoman Empire has no cities equipped with telephone service. Consul-General Ravndal furnishes the information that applicants for franchises should make application to the Public Works Department in Constantinople. Applications will probably be more likely to succeed if made in person, or by a proper representative.

WHY?

No Levers to Pull

Our Catalogue Tells the Story

GRAY TEL. PAY STATION CO.

HARTFORD, CONN.

FOR SALE

For Telephone Plants, Telephone Apparatus and Switchboards for sale by Operating Telephone Companies only. Four cents per word for each insertion. Minimum charge $1.00. Prepaid.

FOR SALE, dirt cheap, 100 series 'phones, with Ericsson transmitters, Holtzer-Cabot generators and oak cabinets. Good as new. Address, R. Valentine, Janesville, Wis. 848

WANTED

For "Help" and "Positions Wanted" advertisements only. One cent per word for each insertion. Minimum charge 25 cents. Prepaid.

WANTED—Position with telephone company on construction or instrument work. Five years' experience, best of references. Address Box 836, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 836

WANTED—Back numbers of AMERICAN TELEPHONE JOURNAL for January, February and March, 1907. Address, stating lowest price, Box 840, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York. 840

WANTED—Telephone workmen; 3 foremen, 30 linemen, 6 cable splicers and 10 outside trouble men, to take places of strikers. Permanent positions at good wages for first-class men. State experience and give reference when applying. National Telephone Company, Wheeling, W. Va. 847

WANTED—Salesman for telephone instruments and supplies for New York State, Pennsylvania or the Middle West. An exceptional opportunity for the right man. Address Box 843, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York City. 843

WANTED---Continued

WANTED—Position as engineer of new telephone company entering the field, or with a company controlling a system of exchanges. Can give best of references. When replying, please state salary and prospects. Address Box 849, care AMERICAN TELEPHONE JOURNAL, 100 William St., New York City. 849

WANTED—Two first-class cable splicers at once. York Telephone Co., York, Pa. 850

WANTED—Manager system of two exchanges, 200-line and 50-line, with toll lines. Man with ambition to become part owner. Address F. H. Davis, Cuthbert, Ga. 851

A SUCCESSFUL, progressive Telephone Manager having full charge of six exchanges wishes to make a change within sixty days. In replying state salary and territory. Address Box 853, care AMERICAN TELEPHONE JOURNAL, 100 William street, New York. 853

TELEPHONE ENGINEER—Capable, executive young man, technical education, experienced in telephone construction, equipment and traffic, desires position with manufacturing or operating company where advancement is offered. Prefer to travel through Eastern States. Engaged at present. Correspondence solicited. Address Box 854, care AMERICAN TELEPHONE JOURNAL, 100 William St, New York. 854

WANTED—Young men who are high school graduates and have had one or two years' experience in telephone work, or who are technical graduates, to enter our apprenticeship course in Automatic Telephony. Call or write. Automatic Electric Co., Van Buren and Morgan Sts., Chicago, Ill. 855

Your Question—Our Answer

MAGNETO LAMP SUPERVISION.—(875.)

I would be greatly obliged if you would give me information on the following in an early issue of your paper.

Is it possible to use glow lamps as clearing-out signals on a magneto board? The switchboard is wired metallic and the clearing-out drops now in use have a resistance of 1,000 ohms. R. F. H.

A way in which this might be accomplished would be by placing condensers in your instruments in series with the ringing coils and working a lamp with battery current through the medium of a relay. This system would necessitate a rather large expenditure for condensers, however, therefore we would suggest the equipping of your cord circuits as shown in Fig. 875. With cords wired as there shown you would provide for double supervision. The efficiency of this supervision depends, however, on how well you have trained your subscribers to "ring off," as unless this is done the controlling relay will remain inoperative.

The action of the supervisory feature of this cord circuit is as follows: Upon replacing the receiver upon its hook at the completion of a conversation the subscriber gives his generator crank the customary short "ring off" turn. The current thus generated passes over the line, through the condenser and one of the relay windings. This causes a flutter of the relay armature sufficient to close the circuit, including the supervisory lamp and the battery. The current flowing through the other winding of the relay, the line, the ringer coils of the instrument and the supervisory lamp holds the armature in the operative position and causes the lamp to glow, thus indicating to the operator that the conversation has been completed.

Upon removal of the plug from the line jack this circuit is broken and the armature of the relay drops back to the normal position.

The 2 M. F. condenser in series with each of the strands of the cord circuit prevents the current of one generator from "throwing" the relay of the opposite cord, while the high potential alternating voice currents pass through the condensers readily.

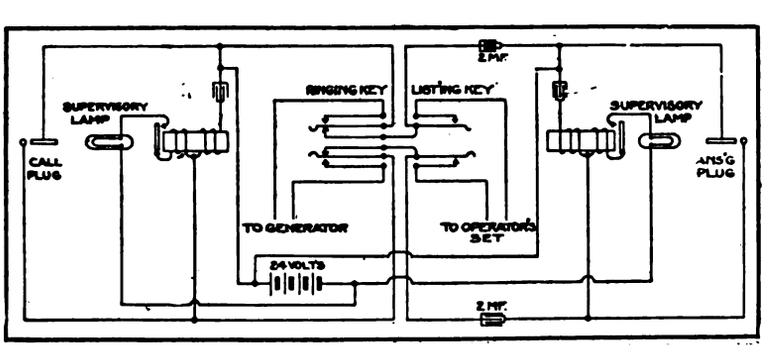

Fig. 875.

TESTS FOR PURITY OF STORAGE BATTERY ELECTROLYTE.—(876.)

We have recently received a consignment of sulphuric acid for use in our storage cells which does not appear to give the same results as former shipments and we have our doubts as to its purity. Kindly advise us through the columns of your valuable paper what impurities may be expected in acid, and tests for determining whether such exist or not. O. A. W., Missouri.

The impurities which are most likely to be in the acid and for which tests may be readily made are: Chloride or free chlorine, the salts of iron, copper, mercury, and the nitrates. Particular care should be given to the securing of assurance of the manufacturers that the acid is manufactured from pure sulphur and not from iron pyrites.

The test for chlorine or chlorides is made by taking a test tube partially filled with electrolyte and dropping into it a few drops of solution of nitrate of silver. If chlorine or its salts are present a curdy white precipitate of silver chloride will appear. This chloride turns to a violet tint on exposure to light. If the clear liquid be poured off this white precipitate and strong ammonia be poured on it it will dissolve.

Test for iron: The presence of ferrous salts in the electrolyte is shown if a dark blue precipitate falls down upon the addition of a solution of the prussiate of potassium. If ferric salts are present in the electrolyte, a solution of yellow prussiate of potassium will give a blue tint. Consequently, if into two test tubes, one of which contains a few drops of yellow prussiate and the other a few drops of red prussiate, a little electrolyte be poured, the two tests can be made at once. If the impurities be present in small quantities there will not be a precipitate formed, but a bluish-green coloration will result.

To test for copper, place a small quantity of electrolyte in a test tube and add an excess of strong ammonia. If copper is present a bright bluish tint will be given to the mixture. If in large quantities, a chocolate-colored preparation will be formed upon the addition of a solution of yellow prussiate of potassium.

If mercury is present, the mercurous salts will give an olive-green precipitate with iodide of potassium. To test for nitrates, some diphenylamine should be dissolved in a small quantity of concentrated, chemically pure, sulphuric acid and placed in a test tube. A small quantity of electrolyte is then dropped carefully in the same tube. If a blue color results, nitrates or nitrites are present. Traces of nitrates are very objectionable, as they cause a surprisingly rapid deterioration of the plates.

In the mixing of electrolyte none other than distilled water should be used.

SULPHATED STORAGE BATTERY.—(877.)

I have eleven cell storage batteries, known as type E-5. For the past three or four days I notice that the sixth, about the time the charge should begin, does not read anything on the voltmeter. I can then charge it with the rest of the batteries, and after the charge it will not show any difference from the rest of the batteries in reading under ten hours. Then for the next ten or twelve hours it will gradually drop off in voltage to zero, but at the same time the specific gravity of the electrolyte is 1,200. Will you please explain to me the cause of the above trouble? I have inspected the cell very carefully and find the plates intact. Can I clear the trouble by charging all my batteries, then cutting the sixth one out until I charge again, and then cut it back and charge with the rest of them? Will you please tell me how to determine how often and how long a set of batteries should be charged, and is that governed by the discharge per hour? C. F. L.

From the description you give of your trouble it would appear that the cell mentioned is sulphated, that is, the plates are inactive and practically incapable of being charged. This might occur from any one of a number of causes, and may be remedied by carefully scraping the plates. The faulty cell should then be charged at a low rate, about one-half normal, for a long period. In this way, by fully charging and then partially discharging the cell for a number of times, the unhealthy sulphate will be gradually eliminated. If your cell is only slightly sulphated the latter treatment will be sufficient without scraping. By adding a small quantity of sodium sulphate or carbonate to the electrolyte the cure of the cell will be hastened. However, in this case it will be necessary to empty the cell, thoroughly wash it and add fresh electrolyte after the plates have been restored to their proper condition. The use of this material is, however, rather hazardous, and should not be undertaken except by a thoroughly experienced battery man.

In relation to the length of charge and frequency, we would say that this depends entirely upon the size of the cells, ampere hour capacity and the rate of discharge. To determine the proper figures it would be necessary for us to have a complete set of well kept records of your battery. These records should show the length and rate of charge, the rate of discharge, that is, the current consumed in the operation of your plant during a given period and any additional data you may be able to give. If you can send them to us we shall be pleased to give you detailed information.

Why Should You Buy Security Conduit Rods?

Because they're the only successful coupling made; because they join instantly and easily; because they're cheap and save cost for repairs; because they're better designed; because they're lighter than any other; because they're not negotiable at junk yards and because they never jam or stick at the wrong moment.

Why Should You Buy Security Cable Trolleys?

Because they're the **only** kind made that will take **any** size cable without jamming on the cable; because they last forever; because they're impervious; because they never break, crack, split or slip; and because they're cheap. Will you write today for further facts and prices? Mention the Security Book.

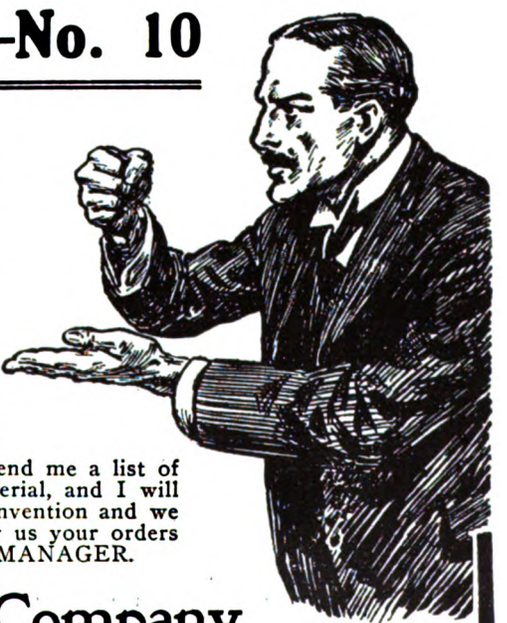
Talks With The Buyer—No. 10



Well, the Glorious Hurrah of the National Convention is over. I will have to wait a minute to catch my breath. There was the enthusiasm of numbers, the glowing reports of success in the field, the interesting exhibits, described in detail on other pages of this paper, that one round of pleasure at Sans Souci Park, plenty to eat and witty speeches at the banquet, and the side trips of which no mention will be made. But, then, you were there, of course. If you were not, you missed the time of your life.

DID YOU GET YOURS?

If you were at the Convention you must have been in our exhibit. If so, you "got yours." If you were not at the Convention write me and I will send it to you. Right over the mysterious box in our exhibit there was a sign which said: "We Are Not In The Advertising Business. We Advertise To Get Business," which is the moral of this story.

When you write and tell me you were not at the Convention, send me a list of your telephone requirements, either instruments or construction material, and I will quote you prices when sending you "yours." If you were at the Convention and we had an opportunity of talking over matters, I know you are sending us your orders already.

From Here and There

NEW YORK COMMITTEE REPORTS IN FAVOR OF INDEPENDENT TELEPHONE FRANCHISES.

ON June 14th the Board of Estimate for the city of New York considered the application of the Atlantic Telephone Company for a franchise to operate an Independent telephone system. After the hearing, seven of the eight members of the Board voted in favor of the franchise. This does not absolutely assure that it will be granted, as this hearing was held by the Board sitting as a committee of the whole, and the members must again consider the matter and take official action upon it after hearing the report which they, as a committee, will make to themselves as the Board.

This action follows a recent report to the Board by Corporation Counsel Ellison, in which he expressed his opinion that the city has no right to grant a perpetual monopoly of telephone service. In this opinion he stated that if for any reason it should appear best for the city to make a grant to the existing telephone company, this should not be a bar to the future granting of a similar franchise to a possible competitor.

MUNICIPAL ELECTRICIANS TO MEET AT NORFOLK, VA., IN AUGUST.

AUGUST 7th, 8th and 9th have been chosen as the dates of the meeting of the International Association of Municipal Electricians, which will be held at the City Hall, Norfolk, Va. This city has been selected as a meeting place not only on account of its convenient geographical location, but also because attendance here will give the delegates an opportunity to visit the Jamestown Exposition without inconvenience. The papers selected for this meeting are as follows: Electrical inspections and records; Modern application of storage batteries; The value of volt and ammeter tests for insulation; A modern fire alarm central office; Operation of a municipal electric light plant.

Further details may be obtained by writing to Frank P. Foster, secretary of the association.

HOME TELEPHONE COMPANY GETS TO WORK QUICKLY AT NASHVILLE, TENN.

THE Home Telephone Company began active work upon its Nashville plant last week. In the residential section poles are being erected and crossarms adjusted preparatory to stringing the wires. Large purchases of supplies indicate a determination to push the work to rapid completion. The conduit system now being constructed in the business district is controlled by the city, and the Home company has been given the same rights as the Cumberland company, the Postal and Western Union Telegraph companies.

The Home company is preparing to take care of twice as many patrons as the Cumberland company now has in the city. Long distance service is now being given from Louisville, Ky., to Nashville, and from Franklin, Tenn., to Birmingham, and the gap between Nashville and Franklin is being closed by a line now under construction.

PROGRESS ON INSTALLATION OF GOVERNMENT TELEPHONES IN MANITOBA.

DEFINITE plans have now been made by a number of the Manitoba municipalities which have decided to install their own telephone systems. As is well known, these will be connected with other parts of the province by the long-distance lines to be built by the Manitoba Government. The municipalities which have decided to install their own systems are: Woodsworth, where there will be three exchanges throughout the municipality to handle the work; Brenda with three exchanges; Victoria with one exchange; Wallace with three, and Hamiota and Blanchard with one each. A number of other municipalities are now taking the matter up and will arrive at some definite understanding before the end of the month. The rural systems, where built by the municipality, will be under municipal control. The Provincial Government will furnish all material for the work so that the systems will be in working order by November 1 of this year. The rural systems which have already been decided upon involve the building of over 3,000 miles of pole lines.

So far nothing definite has been decided regarding the route of the long-distance lines to be built by the Government, but it is reported that one line will run to the extreme southwest portion of the province, while another will run to the northwestern corner. The long-distance system will include three trunk lines, involving the construction of some 2,500 miles of pole line, materials for which are already being ordered and will be on the ground very soon.

MARRIAGE OF FRANK L. BEAM.

FRIENDS of Mr. Frank L. Beam, president of the Ohio Independent Telephone Association and vice-president of the International Independent Telephone Association, are congratulating him upon his marriage to Miss Anna Bogardus, daughter of Mr. W. P. Bogardus of Mt. Vernon. On June 12th the wedding, which was only attended by near relatives, took place at Mt. Vernon, where Mr. and Mrs. Beam will continue to reside after their return from the journey which they are now taking.

ENJOYABLE OUTING OF PITTSBURGH TELEPHONE PEOPLE.

EMPLOYEES of the Pittsburgh and Allegheny Telephone Company, at Pittsburgh, Pa., with their guests, had a most enjoyable outing on Saturday, June 15. About four hundred employees and one hundred guests took a boat early in the morning to Coney Island Park, which is situated on the beautiful Neville Island, about ten miles west of Pittsburgh, on the Ohio River. The scenery along the river is very fine in this region, and, in addition to the pleasure which was derived from watching for interesting sights, all hands enjoyed the music furnished by an excellent orchestra. The outing was arranged by J. G. Splane, president of the company, who has the reputation of always looking out for the welfare and comfort of his employees, and the company provided for the transportation and the music. The details of the outing were handled to the satisfaction of all concerned by the executive committee, composed of the following men: J. G. Splane, president; Ralph E. Flynn, director; L. Mühlheizer, chief engineer; C. F. Bender, auditor; T. G. Davis, assistant treasurer; Frank Hart, contract agent; Fred J. Heavans, purchasing agent; E. W. Hatfield, superintendent of service; H. E. Webb, superintendent of toll department; L. P. Schneider.

Among the features of the programme were the ball game between the general office force and the outside employees, won by the former by the score of nine to five, and also dancing; the prizes awarded were as follows:

Prize Waltz.

First prize, $5.00, Miss Wickenhauser and Mr. Bell; second prize, $3.00, Miss Luella Goettman and Mr. Boyd; third prize, $2.00, Miss Elizabeth Barr and Mr. Tracy.

Buck and Wing Dance.

First prize, $5.00, Miss Marie Nielly; second prize, $3.00, Miss Genevieve Pender; third prize, $2.00, Miss Elizabeth Barr.

Cake Walk.

First prize, $5.00, Miss Elizabeth Barr and Mr. Gleason; second prize, $3.00, Miss Mamie McNulty and Mr. Foster; third prize, $2.00, Miss Margaret McNulty and Mr. Laber.

The character of the gathering and the feeling of those who participated seems to have been hit off admirably by a reporter for the Pittsburgh *Dispatch*, who headed his account of the meeting with the quotation "Is everybody happy?" and the reply given unanimously by all of the company's employees and their guests, "Everybody is happy!"

With the Inventors

REINFORCING TRANSMITTER.

Charles Newman, Elizabeth, New Jersey, patent 850,484, April 16, 1907.

This invention comprises an electro magnet, an armature thereof, having attached to stylus and two graphite points, two mercury retaining cups, and a wax cylinder, the whole in conjunction with a transmitter and battery and a receiver and battery.

The transmitter circuit includes a battery and the electro magnet. The receiver circuit includes a battery, the graphite points and the mercury cups. The inventor's object is to impart to the magnet armature an accelerated movement by means of the rotational force of the cylinder against the stylus, thus increasing and decreasing the resistance between the graphite points and the mercury in a wide field and causing a corresponding flow of current through the receiver which he claims would be greater than is possible in the customary arrangement.

RECEIVER HOLDER.

Delzon G. Hobby, Albion, New York, patent 850,886, April 16, 1907, assigns one-half to Fred L. Ferris, Albion, N. Y.

This invention comprises an arrangement of levers, etc., for holding a telephone receiver to the ear during conversation, thus leaving the hands of the subscriber free for other purposes.

TRUNKING CIRCUIT.

Harry G. Webster, Chicago, Ill., patent 841,747, Jan. 22, 1907, and assigns to Kellogg S. & S. Co.

This patent relates to improvements over circuit described by W. W. Dean in application filed June 28, 1902, serial No. 131,581, consisting in so constructing and arranging the apparatus that pilot signals common to a plurality of trunks may be employed, whereby when one of the trunks is used and its signals operated the pilot signal is also operated, thus attracting more readily the operator's attention.

INTERCOMMUNICATING SWITCHING MECHANISM.

Samuel H. Couch, Boston, Mass., patent 846,827, March 12, 1907, and assigns to Superior Automatic Telephone Company.

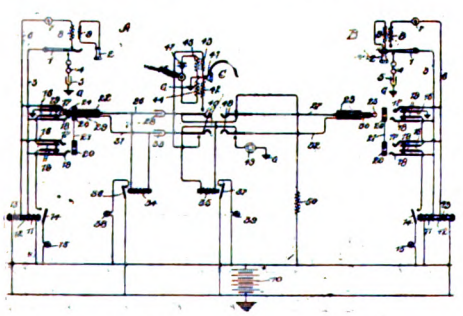
This invention relates to switchhook mechanism for intercommunicating telephones and adapted for use with system covered by Letters Patent of U. S. Jackson, No. 750,769, granted January 26, 1904.

SUPERVISORY SIGNALING SYSTEM.

H. G. Webster, Chicago, patent 853,287, May 14, 1907; assigned to S.-C. Tel. Mfg. Co.

In this system the supervising function of the cord circuit is governed by the high resistance relay 34.

This relay is of such high resistance as compared with the resistance of the line and the talking circuit at the sub-station *A* that sufficient current does not pass through the relay 34 to cause an actuation of its armature 36. Therefore the circuit in which the supervisory lamp 38 is included is not completed. However, when the talking circuit of the sub-station is broken

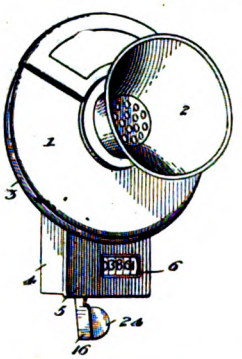


by the movement of its hook switch 1 the full strength of the battery 10 is supplied through the jack springs 17 and 18 and the relay 12, which is of sufficient strength to actuate the relay 34 and cause the lamp 38 to glow, thus showing the condition of the line in relation to the subscriber's instrument. The removal of the plug 22 from the jack 16 cuts off the supply of current from the relay 34.

TELEPHONE CALL REGISTER.

R. H. Manson, Elyria, Ohio, patent 854,830, May 28, 1907; assigned to Dean Electric Co.

This invention comprises a Veeder counting device arranged in a metal casing together with a steel resonating spring. The



metal casing 4 is provided with an extension on the back that will allow of the entire device being secured to the transmitter retaining arm, together with the transmitter 1. The purpose of the invention is the registering of telephone connections.

RELAY.

J. A. Birsfield, Rochester, N. Y., patent 853,292, May 14, 1907; assigned to S. C. Tel. Mfg. Co.

This patent covers the construction of a relay. The pole pieces are long and bent at right angles upon themselves to extend along the top of the coil. The front pole piece is bent at the end to an angle of 45 degrees, thus providing a knife edge upon which the slotted armature lever rests. The longer end of the lever extends backward over the rear pole piece, while the pressure of the contact springs is exerted against the shorter end.

By this arrangement the armature when closed tends to perfect the magnetic circuit of the relay.

TELEPHONE SWITCH.

J. S. Alsobrook, Wood Station, Ga., patent 854,552, May 21, 1907.

This patent is descriptive of a switch for use on telephones to permit two or more persons to use the same line during the same period without interference.

A further object of the inventor is to select, by means of this switch, the desired bell upon a line and also to exclude from the line all others than the person desired.

ELECTROTHERMAL SWITCH.

R. B. Hewitt and J. G. Nolen, Chicago, Ill., patent 851,420, April 23, 1907, assigned to F. B. Cook. This patent relates to a switching device, the actuation of which is due to the heating effect of an excessive current passing through a wire of high resistance. The device comprises a dome-shaped box in which is enclosed and sealed a diaphragm of isinglass or some other suitable insulating material. Mounted in the center of this diaphragm is a contact pin, around which is wrapped several turns of one terminal of one of the conductors. This pin makes contact with another in the upper portion of the sealed chamber, thus completing the circuit.

The action of the switch is due, the inventor states, to the fact that an excessive current passing over the coil of wire around the pin will heat the wire, which will communicate this heat to the pin, which will in turn heat the air in the sealed chamber, causing it to expand and force the diaphragm with its contact pin away from other point of contact.

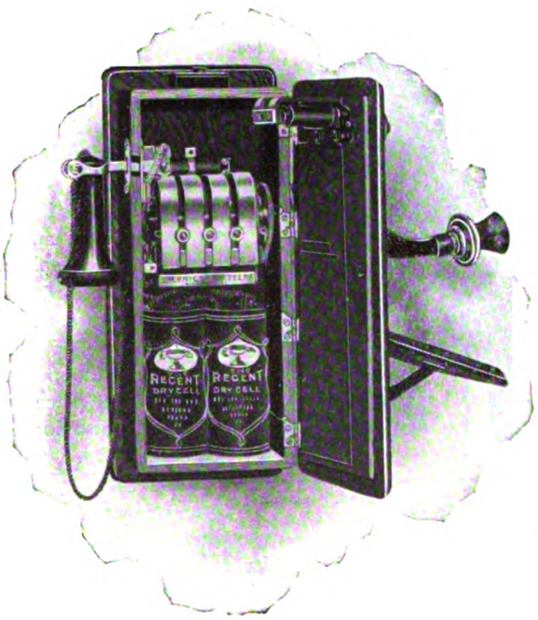
Ericsson Compact Cabinet Magneto Wall Telephone

The unusually small cabinet is made of well seasoned quartered golden oak or black walnut, having Ericsson special piano finish. A patented folding bracket supports the hinged shelf.

The magnets of the generator are made from bars of our own steel, which retains the magnetism longer than "Tungsten." Pole pieces of pressed steel are used in place of the usual cast iron field. An additional magnet may be added to the three or four bar generator. The gears are well ground and run noiselessly.

The frame of the induction coil is made of soft iron tubing riveted to the fibre heads. The windings are practically on the core, the only separation being a sheet of tracing cloth.



Perfect polarization is obtained by employing two magnets, one for each coil, instead of a single magnet.

The switch hook has German silver springs with contacts of platinum. The tension on the lever is adjustable.

Transmitter and receiver are Ericsson Standard types and insure perfect talking service. The transmitter is mounted on a movable arm of pressed steel.

Unless otherwise specified, the No. 2 receiver is furnished with this instrument. The binding posts are concealed and the whole encased in a genuine hard rubber shell.

The lightning arrester has two carbon plates insulated from the ground plate by two perforated celluloid disks. An enameled cover encloses the arrester and the line terminals.

An extra back protects the wiring from moist walls.

With each instrument is furnished two "Regent" dry cells.

From Shops and Factories

BANQUET OF STROMBERG-CARLSON SALESMEN.

FOLLOWING the Independent telephone convention in Chicago, the salesmen of the Stromberg-Carlson Telephone Manufacturing Company, who were in the city, held an informal banquet at the Grand Pacific Hotel. The East, West, North and South were well represented at this gathering. Everyone spoke encouragingly and with the greatest confidence for the future.

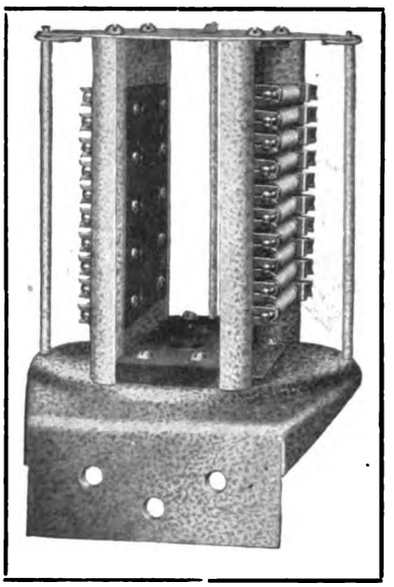
The salesmen present were William Bowen, Des Moines, Ia.; J. J. Nate, Minneapolis, Minn.; D. C. Gould, Omaha, Neb.; B. C. Hyde, Chillicothe, Mo.; E. P. Shafer, Indianapolis, Ind.; T. E. Wright, Clarksburg, W. Va.; P. D. Myers, Lincoln, Ill.; C. F. Speed, Texarkana, Tex.; J. B. Wilkinson, Louisville, Ky.; S. W. Menefee, Detroit, Mich.; H. A. Jones, Philadelphia, Pa. They were joined by the following members of the Chicago office force: A. M. Haubrich, E. C. Lewis, F. G. Hudson, R. S. Stephenson, H. J. Wilms, A. Johnson. C. W. Schafer, acting sales manager; H. C. Slemin, advertising manager, and O. M. Leich, assistant chief engineer, returned to Rochester and could not attend the banquet, as originally expected.

ALL METAL CABLE TERMINALS.

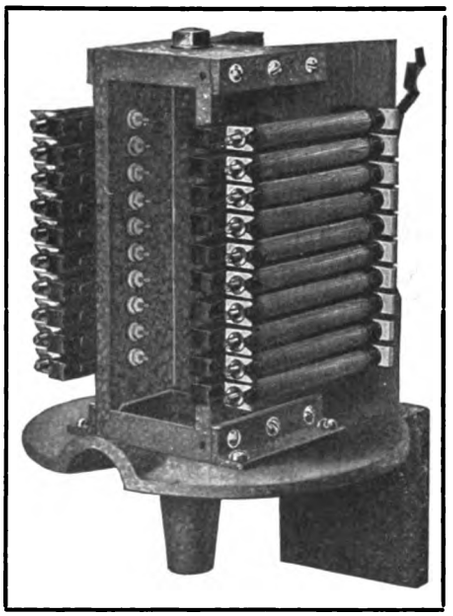
FRANK B. COOK is calling special attention to his "all metal" terminals, and claims that they have numerous advantages over the terminals which are made partly of wood, or those which are made entirely of wood. Cook's terminals are constructed entirely of pressed steel and no castings are used in their construction, which he claims obviates the possibility of breakage, which often occurs in terminals of the cast iron type.

The all metal terminals have absolutely no woodwork to swell, split or warp, and they cannot possibly burn up as wood strips or terminals sometimes do, when a high voltage or current goes through the arrester. It is stated that, as the metal boxes or panels in the metal terminals cannot warp, the covers will always slide up and down easily, and will not stick in damp weather. All the metal parts of the terminals are heavily galvanized. The cans or covers are made of sheet metal, which is also heavily galvanized, and the terminals are therefore exceedingly durable. The terminal has the tubular fuses and carbon lightning arresters, mounted on a sheet metal, moisture proof cable box, so arranged as to give ready access to the connections. The cable is brought in through the self-soldering nozzle shown in the illustration, and the conductors are fanned out and soldered to the clips inside the moisture proof cable box, the front plate or cover being removed for this purpose. Mr. Cook also makes this terminal so that the cable wires can be brought through a hollow rivet and soldered outside of the box.

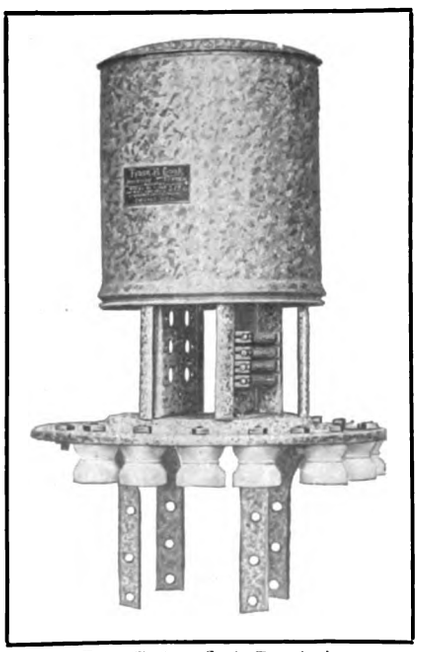
After the cable wires have been distributed and soldered, the front plate may be fastened on securely, a rubber gasket rendering the joints moisture proof. The back of the box, inside, is lined with an insulating fibre to prevent the cable wires from grounding on the box. As an additional protection to the cable, the plug in the top of the box may be unscrewed and the box filled with paraffine or compound, thus making the use of pot-heads unnecessary.



Cook Cable Terminal. Type T-16—Cover Removed.



Metal Terminal, Showing Cable Inserted. Cover and Front Plate Removed.



Type T-18. Cook Terminal.

The jumper wires are soldered to the rear connection, and are led out through holes in the baseplate.

The Types T-16, T-17 and T-18 are all made for use with pot-heads. As in all Cook types of terminals, they are equipped with special springs that hold the covers in place when they are raised, and which also lock them in place when they are down.

These three types of terminals are all equipped with individual protector mounts which can be put on as needed.

Any initial capacity can thus be secured and the capacity of the terminal can be increased as desired, by simply adding protector mounts.

Mr. Cook claims that his new and original method of forcing the fuse contact spring through the hard rubber blocks is a very radical improvement. The blocks are heated and the springs are forced through so that when the rubber has cooled again the springs are held absolutely rigid. This construction also prevents any surface leakage, on account of moisture collecting on the blocks between the springs.

Type T-16 is arranged for fastening to the side of the pole. Types T-17 and T-18 combine the terminal and distributing rings. The protectors can be mounted one pair at a time, and the porcelain knobs can also be added one at a time as needed.

Type T-17 terminals are arranged to fasten to the side of a pole, while Type T-18 is provided with means for proper fastening when mounted on the top. These several types are manufactured in order to meet all the conditions occurring in practice.

In addition to the terminals here described, Mr. Cook manufactures various other types, about which he will be pleased to tell prospective purchasers. Inquiries should be addressed to Frank B. Cook, 240 West Lake street, Chicago, Ill.

THE STANDARD "HEMINGRAY"

All With The

"Patent Drip Petticoats"

The Hemingray-Glass Co., Office, COVINGTON, KY. Factory, MUNCIE, IND.

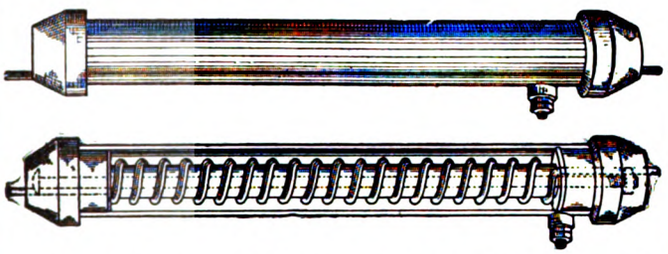
— ESTABLISHED 1848 —

A LIGHTNING FLASH

ON A TELEPHONE LINE MEANS NOTHING

PROVIDING THE LINE IS EQUIPPED WITH

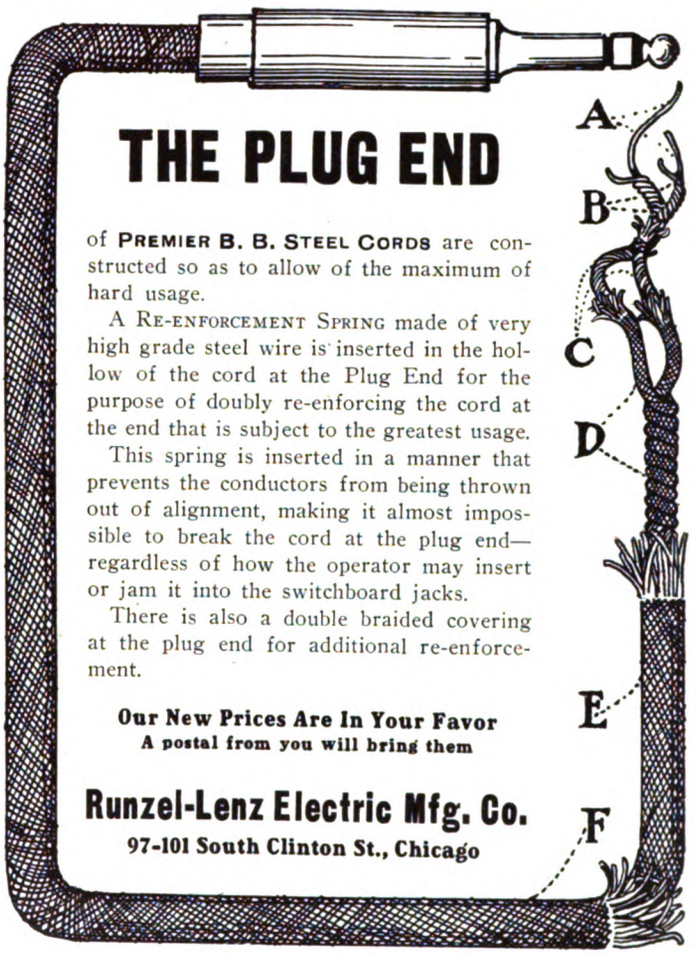
The Sky Rocket Arrester



A continuous discharge surface of fifty inches coiled within the grounded cylinder is the reason. Lightning will not follow such a succession of coils. So it takes the shorter route to ground. No harm done telephone or switchboard.

GET A SAMPLE TO-DAY

CHANCE MANUFACTURING CO.
CENTRALIA, MO.



THE PLUG END

of PREMIER B. B. STEEL CORDS are constructed so as to allow of the maximum of hard usage.

A RE-ENFORCEMENT SPRING made of very high grade steel wire is inserted in the hollow of the cord at the Plug End for the purpose of doubly re-enforcing the cord at the end that is subject to the greatest usage.

This spring is inserted in a manner that prevents the conductors from being thrown out of alignment, making it almost impossible to break the cord at the plug end—regardless of how the operator may insert or jam it into the switchboard jacks.

There is also a double braided covering at the plug end for additional re-enforcement.

Good News—and It's All New

NEW COMPANIES.

MOOREFIELD, Ark.—An Independent telephone company, to be known as the Moorefield Telephone Companw, has been organized at this city by F. M. Ham, M. E. Moore, J. M. Duncan, B. B. Conine, J. B. Massey, Geo. W. Wright, W. B. Morris and W. E. Dodd. It is its intention to construct a line from Moorefield to Batesville, and work has already been commenced.

SANTA MONICA, CAL.—Articles of incorporation have been filed by the Santa Monica Bay Home Telephone Company, of Santa Monica. It has an authorized capital stock of $500,000, of which $5,000 has been subscribed. The following directors have been elected: T. H. Dudley, W. S. Vawter, L. Blankenhorn, B. O. Kendall, L. C. Torrance.

ARCOLA, ILL.—The Aerial Transit & Telephone Company, of Arcola, Ill., has been incorporated with a capital stock of $1,000,000.

CULLOM, ILL.—The Vermillion Mutual Telephone Company No. 2, with its principal office at Cullom, has filed articles of incorporation. The capital stock is given at $1,500, and the incorporators are John Diebel, Charles Donnelly, William Frantz and Leonard Haag.

EL PASO, ILL.—The Panola Independent Telephone Company, of El Paso, has filed articles of incorporation. It has an authorized capital stock of $500,000, and the incorporators are Joseph Haas, William Burroughs and Geo. Pinkham.

JEFFERSONVILLE, IND.—An Independent telephone company, in which J. W. Fortune is actively interested, has been organized, and is about to apply for a franchise in this city.

SEYMOUR, IND.—A new Independent telephone company, to be known as the Citizens Mutual Telephone Company, has been incorporated with a capital stock of $10,000.

LOW MOOR, IA.—The Low Moor Telephone Company has been incorporated with a capital stock of $5,000.

SABETHA, KAN.—An Independent telephone company is being organized by the business men of Sabetha, and $6,000 has already been subscribed. Among those actively interested in the new enterprise is H. M. Baldwin, of Seneca, he having been engaged to draw up incorporation papers, etc.

LEITCHFIELD, KY.—An Independent home telephone company, whose stock is to be owned exclusively by local people, is being organized in this city. It is the company's intention to erect four lines from Leitchfield, extending to Pearman, Peonia, Short Creek and Duff. In addition, several toll lines are to be built, and connections effected with the Hardin and Breckinridge county Independent exchanges.

SYMSONIA, KY.—The Symsonia Telephone Company has been incorporated with a capital stock of $2,000. Among the incorporators are B. A. Wallace, E. T. Wallace and J. T. Draffen.

MUNISING, MICH.—An Independent telephone company has been formed at Munising. A franchise has been secured by Dr. G. A. Trueman, and work on the system will be commenced at once.

GASCONADE, MO.—The Farmers' Independent Telephone Company has been organized, and work on its system commenced.

LINCOLN, MONT.—The Gould-Lincoln Telephone Company, which is to extend between Lincoln and Silver, has been incorporated. It has a capital stock of $10,000, and the incorporators are H. L. Miller, J. A. Russell, of Chicago, and R. R. Johnson, of Los Angeles.

CHARLOTTE, N. C.—A charter has been granted to the Black Mountain Telephone Company, of Black Mountain, N. C. The authorized capital stock is $50,000, of which $25,000 in preferred stock can be issued and $25,000 common stock, but the company is to begin business with $20,000. The incorporators are J. D. Murphy, M. L. Reid, J. H. Tucker and others.

MT. AIRY, N. C.—The Mt. Airy Telephone Company, which was organized some time ago, has filed articles of incorporation, and expects to install and operate local and long distance telephone systems. The capital stock is placed at $50,000, and the incorporators are E. C. Hines, J. A. Hadley, W. E. Merrim and others.

FILLMORE, N. D.—The farmers between Esmond and Fillmore have organized an Independent telephone company, to be known as the Fillmore Farmers Telephone Company. It intends to construct lines between Esmond and Fillmore. The following officers have been elected: O. Vold, president; John Steenerson, treasurer; B. S. Amdahl, secretary.

GLEN ULLIN, N. D.—An Independent telephone company, whose lines extend between Glen Ullin and Leipsig, has been incorporated by L. A. Tavis, W. T. Moore and Carl Pribbenaw. The company, which is known as the Tavis-Moore Telephone Company, expects to build lines out from Leipsig in a number of directions, serving the people in the southern part of the county.

ROCKLAKE, N. D.—An Independent telephone company has been organized at Rocklake.

WILTON, N. D.—The Farmers Mutual Telephone Company, Wilton, N. D., has been incorporated by C. B. Flinn, George Mathison, W. O. Miller and others of this city.

LYRA, O.—The Lyra Independent Telephone Company has been organized, and the following officers elected: M. W. Bandy, president; C. E. Hayward, secretary; Tiffin S. Collett, treasurer. It is the company's intention to build lines from Lyra to South Webster, and to eventually connect with the Home Telephone Company's lines at Wheelersburg.

EL RENO, OKLA.—A new Independent telephone company has been organized at this city to operate in competition with the Bell company. The new company will have a capital stock of $100,000. It will have direct connection with the Canadian Farmers' Telephone exchange. The organizers of the company are all El Reno people.

SALEM, S. D.—The farmers northeast of Salem have organized a telephone company to be known as the Center Telephone Company, and are now building lines which will connect them with Salem and other points.

INDIAN CREEK, TEXAS.—A charter has been granted to the Indian Creek Telephone Company, of Indian Creek. It has a capital stock of $2,000, and the incorporators are T. J. McBride, S. Martin, W. J. McAden and others.

LEBANON, VA.—The Lebanon Telephone Company, of Lebanon, has been incorporated with a capital stock of $3,000. Among the incorporators are R. S. Meade, E. S. Finney, C. C. Alderson, V. B. Gilmer, L. L. Bays, O. S. Burns, all of Lebanon.

OAK GROVE, VA.—Articles of incorporation have been filed by the Rappahannock Telephone Company, of Oak Grove. It has an authorized capital stock of $5,000. The following officers have been elected: D. H. Griffith, president; H. W. Coates, vice-president; Charles Hayes, secretary; R. B. Spilman, Andrew Flemer, W. D. Wirt, F. W. Alexander, directors.

PENAWAWA, WASH.—The Penawawa Telephone Company, with a capital stock of $2,500, has filed articles of incorporation. The incorporators are Silas M. Smith, W. F. Adams, H. S. Smith, F. A. Lee and Miles Champlin.

PARKERSBURG, W. VA.—The Rural Telephone Company, of Parkersburg, has been incorporated with a capital stock of $10,000. Among the incorporators are E. D. Ball, of Elizabeth; F. L. Hopkins, of Palestine; A. C. Farnsworth, of Eatons; P. B. Vanhorn, of Toppins Grove, and F. C. Merrell, of Parkersburg.

BAGGS, W. VA.—On account of the poor service said to have been rendered by the Bell company in this city, the citizens have organized an Independent company, and will build a line from Baggs to Wamsutter.

PINCHER CREEK, ALB., CAN.—An Independent telephone company is being organized at this city. Among those interested are S. W. Berry, J. E. Woods and others.

BLENHEIM, ONT., CAN.—A local telephone company has been formed by the business men of Blenheim, whose intention it is to build lines from this city to Mull, Guilds and other places.

MARKHAM, ONT., CAN.—The Uxbridge & Scott Independent Telephone Company has been formed at this city for the purpose of building a telephone system in Mount Albert, Markham, Sunderland, Stouffville, Claremont and other places.

UXBRIDGE, ONT., CAN.—A new Independent telephone company is being organized at this city, in which W. S. Ormsden and R. J. Moore are actively interested.

FRANCHISES.

DUNDAS, MINN.—The Northfield Telephone Company, of Northfield, has been granted a franchise to construct a telephone line through Dundas.

WEATHERFORD, TEXAS.—Permission to erect and maintain a telephone line from Weatherford along the Weatherford and Balch and the Bethel and Harmony public road has been granted to W. K. Neal.

FINANCIAL.

TAMPICO, ILL.—At a recent meeting of the Tampico Farmers' Telephone Company it was decided to increase the capital stock from $6,000 to $10,000.

BEDFORD, IND.—The Bedford Home Telephone Company has increased its capital stock from $75,000 to $250,000. The additional capital is to be invested in improvements and extensions of its system. E. B. Thornton is president, and Chas. W. Lanz, secretary.

Good News—And It's All New

BROOKSVILLE, KY.—The Bracken County Telephone Company has increased its capital stock from $10,000 to $20,000.

ST. PETER, MINN.—At a recent meeting of the stockholders of the Nicollett County Telephone Company it was decided to increase the capital stock from $100,000 to $125,000, the increased capital to be used in making extensions to its plant. The company is also contemplating the purchase of the telephone lines from A. C. Buck, of Henderson, who owns and operates an exchange at Arlington, with toll lines to Henderson, New Auburn, Green Isle and Rush River.

MONTICELLO, MO.—The Citizens' Telephone Company has voted to increase its capital stock from $12,000 to $50,000.

JACKSON CENTER, O.—The capital stock of the Jackson Center Telephone Company has been increased from $25,000 to $40,000.

NUMIDIA, PA.—The Roaring Creek Valley Telephone Company, which operates a line between Numidia and Mill Grove, has declared a dividend of six per cent.

RIMOUSKI, QUE., CAN.—The Kamouraska Telephone Company has increased its capital stock to $250,000, and has been given power to extend its lines in Rimouski and Matane counties.

ELECTIONS.

EUREKA, IND.—At the meeting of the stockholders of the Luce and Ohio Township Telephone Company, held at Eureka, the following directors were elected: J. C. Haines, C. B. Laird, Loren F. Gage, Allen J. Payton, Jacob Weber, Adolph Egloff and C. W. Halbruge.

NEWAGO, MICH.—The following officers have been named by the Marengo Prairie Telephone Company: President, E. L. Hornbeck; secretary, George Gorman; treasurer, M. H. Angervine.

HALE, MO.—The Missouri Midland Telephone Company at its recent meeting at Hale elected the following officers and directors: P. C. Green, president; G. A. Marple, secretary and treasurer; L. Bartlett, I. H. Hendricks, William Forsythe, D. Zumbro, directors.

LINWOOD, NEB.—The directors of the Linwood Telephone Company are M. J. Rezac, Charles Homalka and John Kucera.

MISCELLANEOUS.

SARATOGA, ARK.—The telephone line running from Saratoga to Columbus has been purchased from the Nashville Telephone Company by Arthur Stoker, of Saratoga.

PEKIN, ILL.—At a recent meeting of the Citizens' Telephone Company it was decided to purchase the property and franchise of the Pekin Telephone Company, the purchase price being $100,000.

BOSTON, MASS.—At a meeting of the stockholders of the Metropolitan Home Telephone Company a permanent organization was effected, and the following officers elected: Colonel Albert Clarke, president; Albert L. Ireland, vice-president; James G. Ferguson, treasurer; Roger E. Miley, secretary.

COLUMBIA, TENN.—It is the intention of the Citizens' Telephone Company to reorganize with an authorized capital stock of $75,000. The new company proposes to establish a series of thoroughly up-to-date exchanges throughout the county.

PERSONAL.

C. M. ARMSTRONG has been appointed manager of the Central Union Telephone Company's exchange at Galena.

T. M. BRADFORD, formerly connected with the Traffic Department of the Central Union Telephone Company, has been appointed service inspector of the Bloomington, Ill., district of that company.

C. S. EDWARD, formerly connected with the Central Union Telephone Company in the capacity of service inspector, has accepted the position of traffic engineer with the Pioneer Telegraph and Telephone Company, Oklahoma City, Okla.

J. W. HOBBS has been appointed manager of the Central Union Telephone Company's exchange at Cairo, Ill.

H. L. MANOR has recently been appointed manager of the Independent Telephone Company's plant at Taylor, Texas.

L. O. TRUMP has been appointed manager of the Central Union Telephone Company's exchange at Athens, Ill.

With the Builders

PEKIN, ILL.—Among the improvements in its system planned by the Citizens' Telephone Company is the building of a line to connect with the Home Telephone Company of Canton. The Citizens company has recently constructed a line to Washington, giving connections to Eureka, Minonk, Roanoke, Metamora, Deer Creek and East Peoria.

FAIRMOUNT, IND.—The Citizens Telephone Company contemplates the extension of its rural lines.

REYNOLDS, IND.—New lines from Reynolds to other towns are to be erected by Dr. Besser, of Remington, who owns the local system at Reynolds, at which point he is also to establish an exchange.

GARNAVILLO, IA.—Improvements in its system at this city are being made by the Standard Telephone Company.

GARNER, IA.—The Garner Telephone Company, which is thoroughly overhauling its system at this place, expects also to make many improvements in its plant at Kanawha.

SIDNEY, IA.—The Farmers' Mutual Telephone Company is extending its lines to Hamburg.

ELLSWORTH, KAS.—Considerable construction work is to be undertaken by the Ellsworth Co-operative Telephone Company.

GOVE, KAS.—The lines of the Farmers' Telephone Company are being extended.

MINNEAPOLIS, KAS.—The Farmers' Telephone Company is building a line from Minneapolis to Culver.

BRIDGTON, ME.—Many improvements in its system at Bridgton are being made by the Ossipee Valley Telephone Company.

HOLLAND, MICH.—Work on the installation of its system is being carried on by the Citizens Telephone Company at this city.

MARQUETTE, MICH.—Many improvements and extensions in its system are planned by the Marquette County Telephone Company.

SAGINAW, MICH.—It is the intention of the Saginaw Valley Telephone Company to expend between $150,000 and $200,000 on its plant in this city.

BLACKDUCK, MINN.—A long distance telephone line from Blackduck to International Falls is to be constructed by A. A. White, of St. Paul, owner of the townsite of Littlefork and many other townsites throughout the Northwest.

LANCASTER, MINN.—The Kittson Telephone Company expects to extend its line from Lancaster to Bronson.

MEDFORD, MINN.—The Deerfield Telephone Company expects shortly to commence the construction of its lines at Medford.

NEW ULM, MINN.—Rural lines between Lafayette and Bernadotte and other points are being erected by the New Ulm Rural Telephone Company.

WINONA, MINN.—The Winona Telephone Company, which has just completed a new line to Stockton Hill, has under consideration the construction of several other new lines.

ST. JOSEPH, MO.—A new central energy system is to be installed by the Citizens Telephone Company. The plant will be a modern one in every respect, and is expected to represent an outlay of many thousands of dollars.

BAINBRIDGE, N. Y.—Many improvements and extensions in its system are being made by the Union Telephone Company.

FINDLAY, O.—Many improvements in its system are being made by the Home Telephone Company.

CONESTOGA, PA.—A line between Northern Joanna and Western Geigertown is to be erected by the Conestoga Telephone Company.

WESTERLY, R. I.—Among the extensions planned by the Westerly Automatic Telephone Company is a line over Berry Hill.

MART, TEXAS.—An exchange building, which is to cost in the neighborhood of $10,000, is to be erected by the Mart Telephone Company.

CENTRALIA, WASH.—The Home Telephone Company is considering the advisability of building a line from Centralia to Rochester.

CHIPPEWA FALLS, WIS.—The Melville Settlement Telephone Company, of South Siegel, is extending its lines in the direction of Chippewa Falls.

MISSION, B. C., CAN.—The Mission Independent Telephone Company is preparing to construct several more long distance telephone lines.

WINNIPEG, MAN., CAN.—The first long distance telephone line to be built by the Manitoba government is to run between Virden and Brandon, and from thence to Hamiota. Address Hon. J. H. Howden, minister of telephones, Winnipeg, Man.

WINNIPEG, MAN, CAN.—The Manitoba government has purchased a large site here upon which to erect a central telephone exchange for the system to be built by the government in Winnipeg. Hon. J. H. Howdin, minister of telephones and telegraphs, states that tenders will be called during the present month for the construction of telephone systems in Winnipeg and Brandon.

FORT WILLIAM, ONT., CAN.—The city council has voted $36,000 for improvements to the municipal telephone system. Address Mayor Whalen.

UNDERGROUND.

SULLIVAN, ILL.—Considerable underground work is to be done by the Mutual Telephone Company in this city.

LANSING, MICH.—It is the intention of the Citizens Telephone Company to place many of its wires underground in this city.

ATHENS, O.—The Athens Telephone Company is considering the advisability of installing a conduit system in Athens.

PHILADELPHIA, PA.—Among the improvements planned by the Keystone Telephone Company is the expenditure of $65,000 in conduit work.

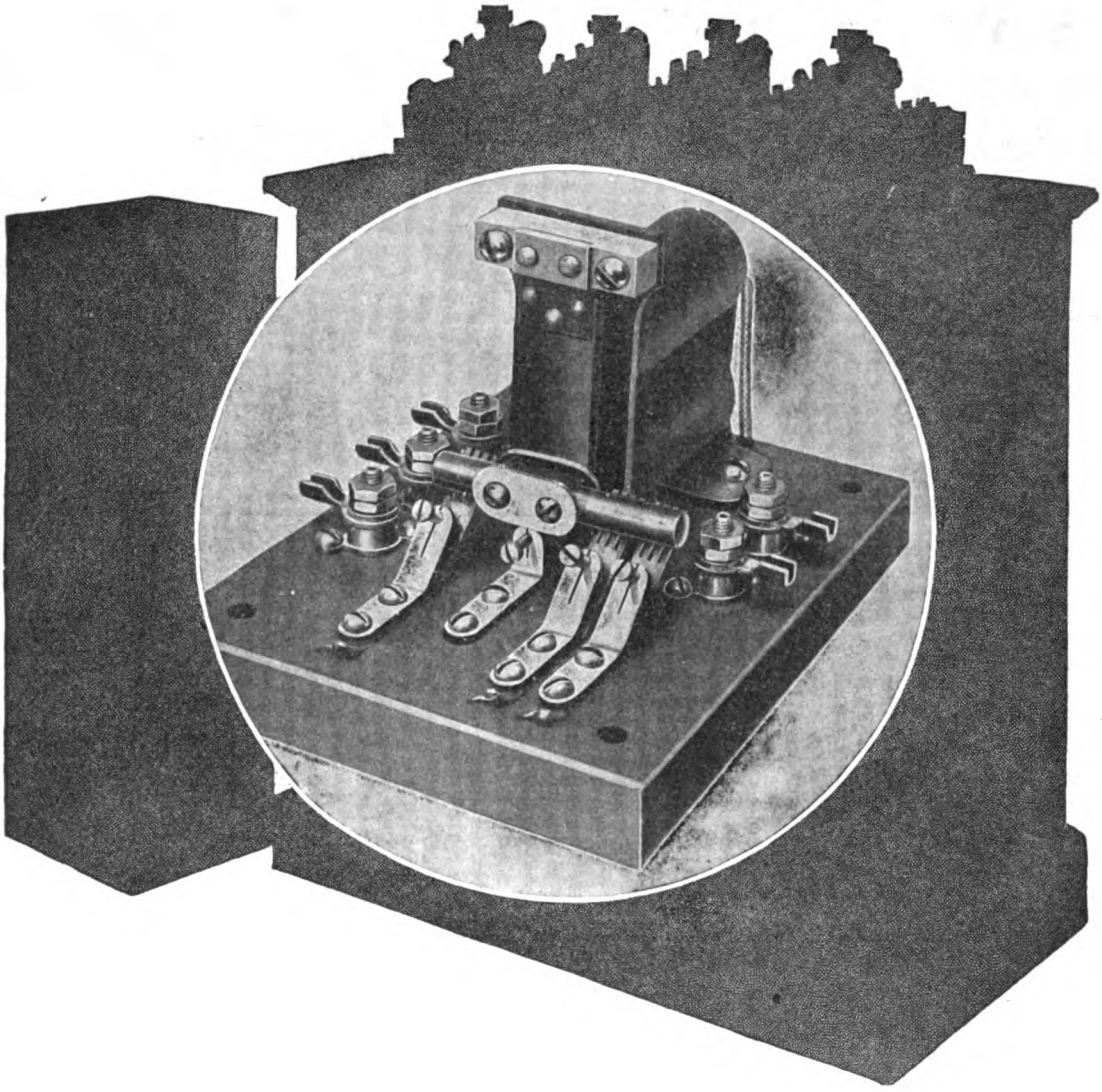
DEAN TELEPHONE APPARATUS

A Dean Electric Detail--Harmonic Converter Relay for Starting the Selective Vibrators



This Primary Circuit Closing Relay in our Harmonic Converter is for closing the circuits of the transformer primaries of the Dean Harmonic Converter, and is especially designed for small exchanges where dry cells are used for the ringing current. A minimum current consumption is imperative for party line selective signaling in the small exchange. This relay, operated by a circuit extending to special contacts on the ringing key at the switchboard, is entirely automatic, not in any way depending on the operator for its prompt and accurate action. It actually starts the selective vibrator and consumes absolutely no current except during the period that the operator is ringing the subscriber. Our folder No. 5 should be in your possession if you wish to have your selective ringing knowledge complete.

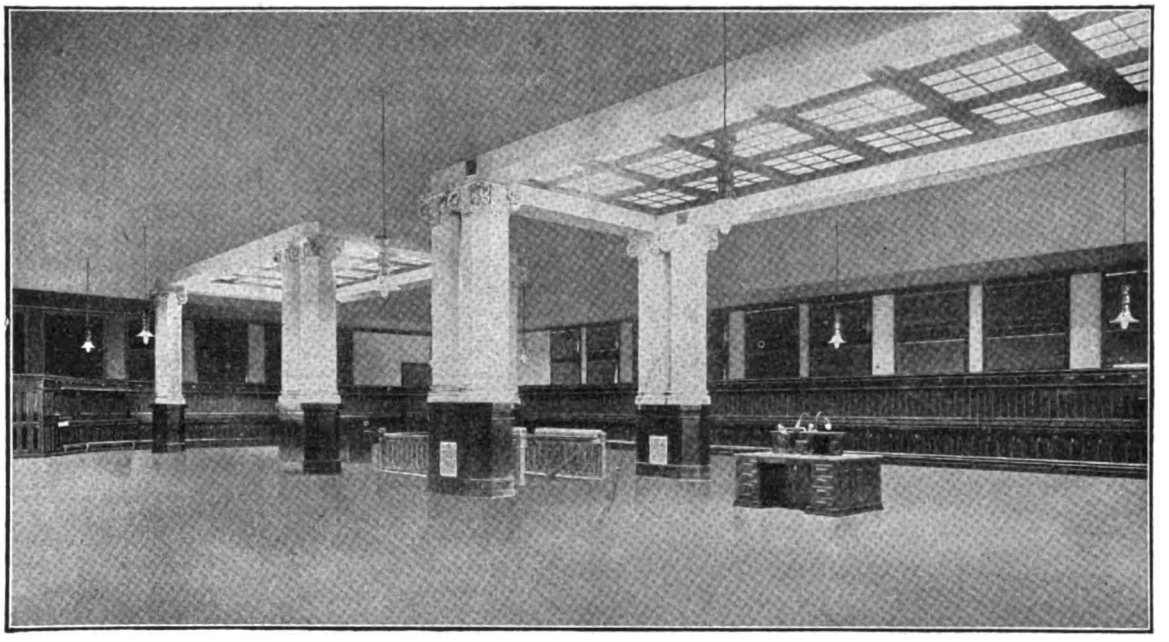
CENTRAL ENERGY MULTIPLE SWITCHBOARDS



Main Operating Room, Showing Main Switchboard from Section No. 43 to 108.

The Stromberg-Carlson Telephone Manufacturing Company has built and installed "Central Energy" Multiple Switchboards having an aggregate ultimate capacity of 503,900 subscribers' lines.

This 17,000 line Central Energy Full Multiple Switchboard is provided with lamp line signals and double lamp supervision signals, provisions being made also for a four-party line harmonic ringing system.

The present equipment is for 12,500 multiple subscribers now operating 10,000 Central Energy Four-Party Harmonic Wall and Desk Instruments of our manufacture.

Quality Apparatus gives the most rapid and efficient service—least expensive to maintain—excels in design and construction.

Our facilities permit immediate construction of the largest switchboards required and provide aptly for delivery of the smallest switchboards promptly.

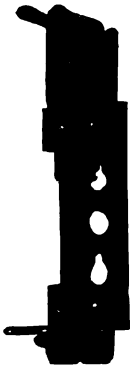
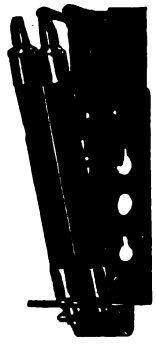
UNIT TYPE MOUNTED LINE FUSE



Mounting Plate is made up of pressed steel on which is mounted the German silver springs insulated by hard rubber blocks.



Protection is made up in units of one pair each equipped with fuses and carbons or fuses only.

No. 263

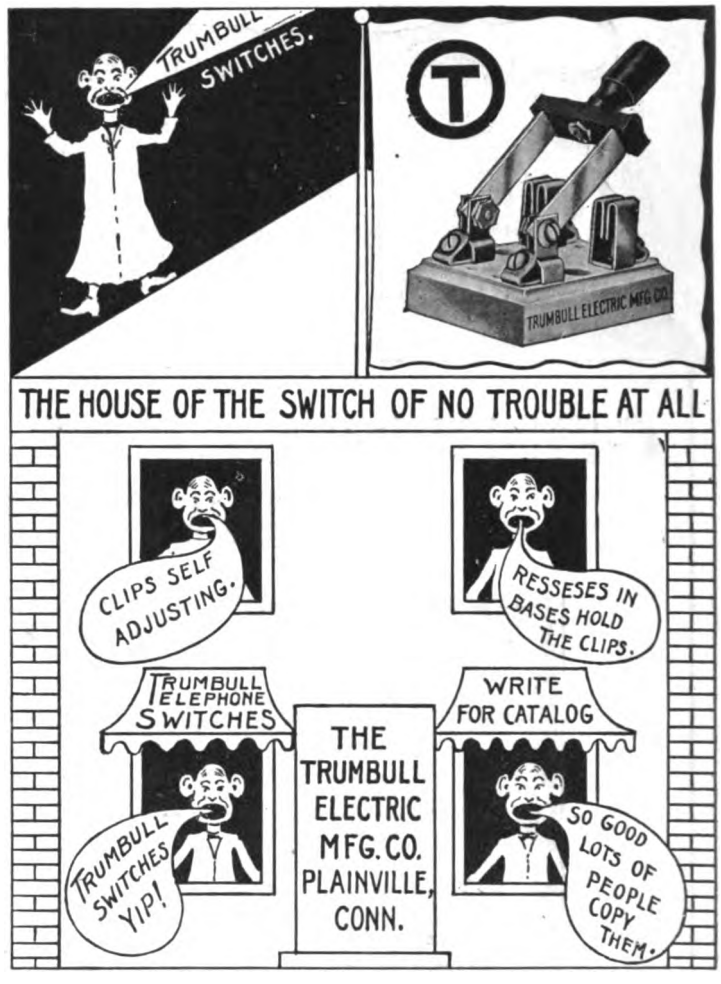
The Fuses are of the snap in type, easy to take out, made 1, 2½ or 5 Amperes.

The units are held on frame or strip by two screws making it easy to replace or change location.

Sterling "GOOD! GOODS"

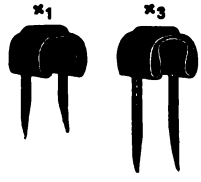
Equip your pole houses with the mounting strips and put on the protectors as required

STERLING ELECTRIC CO.
La Fayette, Ind.



Installation Expenses Reduced

by using Blake Insulated Staples instead of expensive cleats and screws for interior wiring.



Blake Insulated Staples

are cheaper than the screws used with wiring cleats, make a neater appearance and are more effective.

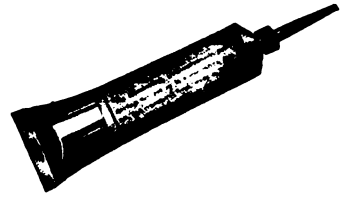
Insulating qualities excellent. Drive well too.

Samples on request.

Soldering Economy

is accomplished by the use of

Blake Tube Flux



The flux is always preserved in perfect condition, so that the last squeezed out of the tube is as good as the first.

Just the right size to be carried in the pocket. Always clean, never mussy.

Economical—Clean—Satisfactory

Sample Tube, 20c., Postpaid

Hercules Anchor

(PATENTED)

The Iron Dead Man

Made in five sizes, from that for 20-foot pole to large one for extremely heavy strains, wrecking trains, etc.

They are the best anchor in every way for holding up heavy leads and round corners. Easy to set, pull against solid earth and will not creep.

As they are made of Malleable Iron, they are practically indestructible. All anchor plates guaranteed.

Send for descriptive circulars and prices.

THE W. G. NAGEL ELECTRIC CO.

26-30 ST. CLAIR ST., TOLEDO, O.

SIMPLICITY

Note how easy it is to splice pairs when you use HARGIS CABLE SPLICING JOINTS. Note how easy it is to get into the joint in case you have to test out for trouble.

If you are stringing several lengths of cable and a storm blows up, you can get your cable ends into a moisture-proof HARGIS JOINT in no time and thus prevent moisture from getting into your cables. When the weather clears up, your lineman can go out and splice the pairs in each joint.

While an expert cable splicer is rigging up his platform, etc., to start to work on a horizontal joint, a lineman can wipe in a HARGIS JOINT. The lineman can have all his pairs spliced and be off to the next job about the time the expert splicer would be ready to begin wiping the second end of his horizontal joint.

Making a splice with a HARGIS JOINT is so easy that you don't need a cable platform. There is no need for a drip pan to catch the paraffine, because the HARGIS JOINT is submerged in the paraffine pot, and there is no waste. The moisture has to go out. No uncertainty.

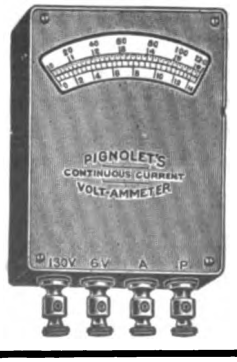
LOOKING FOR TROUBLE?



Suppose you have a line in trouble—grounded or open. You don't know the exact location, but you send out a troubleman to hunt it up and clear it. It may take him an hour or a day. Meanwhile the subscriber is getting hot under the collar and saying things about telephones in general and yours in particular.

If you have a Pignolet voltmeter or volt-ammeter you can determine the approximate location and also get an idea of the nature of the trouble. With the information your troubleman can find the fault in jig time, and you will have prevented the subscriber kicking by giving him service at the earliest possible moment.

Does it pay to be informed? You ought to know.

Why Should You Buy Security Conduit Rods?

Because they're the only successful coupling made; because they join instantly and easily; because they're cheap and save cost for repairs; because they're better designed; because they're lighter than any other; because they're not negotiable at junk yards and because they never jam or stick at the wrong moment.

Why Should You Buy Security Cable Trolleys?

Because they're the **only** kind made that will take **any** size cable without jamming on the cable; because they last forever; because they're impervious; because they never break, crack, split or slip; and because they're cheap. Will you write today for further facts and prices? Mention the Security Book.

"It might interest you

to know that the total maintenance expense of parts for our entire plant of 3,000 switches for the past eighteen months has been $10.24," writes Supt. J. A. Duncan, of the Sioux City Telephone Company, Sioux City, Iowa. (This company operates our AUTOMATIC TELEPHONE SYSTEM.)

"A like sum

would perhaps take care of the repair cost on operators' chairs in a manual exchange of the same size," adds Mr. Duncan. (We'll be glad to send you a copy of his letter if you'd like to see it.)

It occurs to us

that the one item of switchboard cords alone for a manual exchange of 3,000 lines would amount to at least $150 in eighteen months. That is fifteen times the cost of all repair parts on the Sioux City automatic exchange.

That is only one

of the many economies of the AUTOMATIC SYSTEM. These economies all help to swell the profits. And—the AUTOMATIC, being the best service, commands the highest rates. Low production cost plus high selling price equals big dividends. That is what led to the adoption of the AUTOMATIC TELEPHONE SYSTEM in the following cities:

Experiments With Concrete Poles*

By G. A. Cellar.

PROBLEMS confronting those who first undertook the manufacture of concrete poles without any precedent to guide them included the following:

(1) Shall the poles be made of such dimensions as to necessitate a concrete foundation, or of such size and shape that they will be securely held in ordinary earth by thorough tamping?

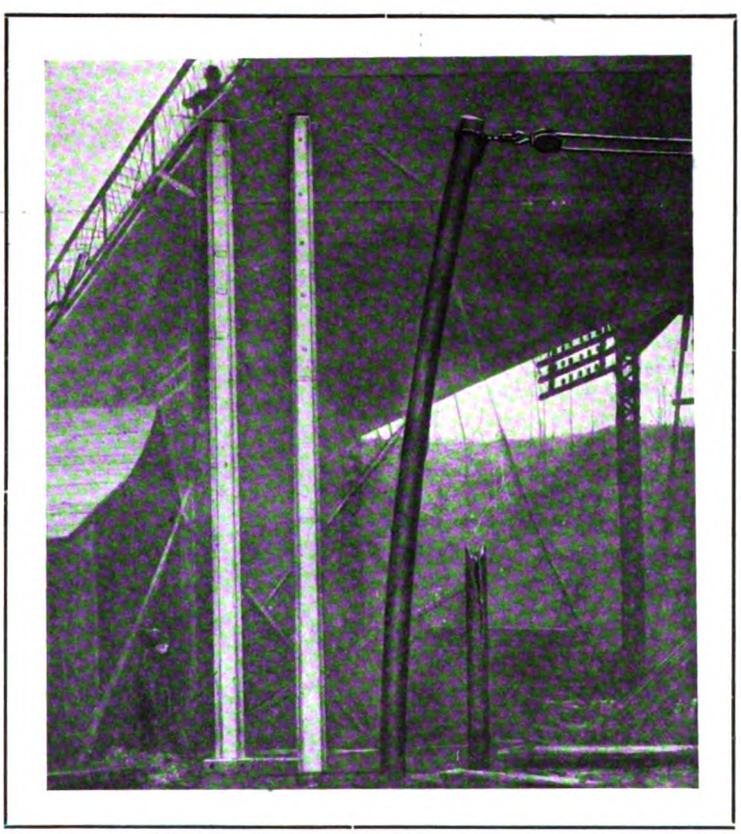
(2) Shall they be made in a yard and then distributed, or shall the material be transported to the various locations in which the poles are to stand and the poles be made there?

The experience of late years on all lines of railroad is that the expansion of track and other improvements have made it necessary to move to new right-of-way lines so many telegraph poles that, in planning for a pole of infinite life, it would be better, if possible, to procure a type which would be secure without the foundation which would render its location when once set up a permanent fixture, and this type would be preferable to the fixed type;

(a) Because of its smaller cost to construct;

(b) Because of its smaller cost to set up in the line, and

(c) Because it will be easily removable to a new location.



Test (No. 2) of Wooden Pole. Photograph No. 1, Showing Curvature When Top Deflection Was 56 Inches.

The second question was decided in favor of the manufacture of poles in yards, because their construction at the points at which they are to be set involves the transportation to these points of not only the solid materials to be used in their manufacture, and shelter for these materials, but also the water, which is not ordinarily available, and the forms. In fact, a very considerable additional physical property in the crude materials proportionate to the smaller sum total of the finished product.

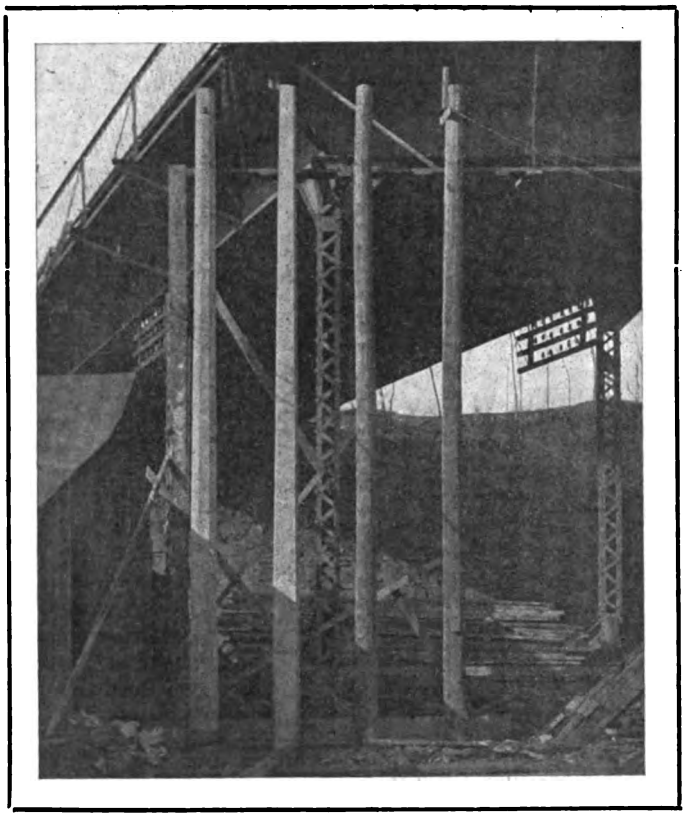
On busy railroads construction at the point of setting would involve the assembling of the apparatus on a car, the use of motive power and the obstruction of the main track to a certain degree. This being the case, the alternate plan does not require any more apparatus or crew, will not require the services of a locomotive and crew as long or for any longer time than the plan of making the poles at the place where they are to be set up; but it involves in addition, perhaps, the use of a derrick to be mounted on a car, the beam of which shall have sufficient radius to reach the line on which the poles are to be set. The procedure to be followed would then preferably be to manufacture the poles in a yard and have them thoroughly seasoned there before moving. In preparing for distribution, they should each be tagged or otherwise have a designation or location attached to each one, indicating the exact site in which the surveyor or inspector has designated each to be set on account of the necessities for grading the line. The poles should then be loaded by the use of the yard derrick or a derrick car, be taken out by a train, and by the crew of the derrick set up in their permanent places in the line, in holes previously dug for their reception. This plan will require very little if any more obstruction of the main track than the stoppages requisite for the unloading of seasoned cedar poles.

In the working out of the plans for the requisite strength with the minimum of weight, the two hollow poles referred to in detail hereafter were made. The results of the tests are given in this paper, as an example of progress and are not to be taken as the best form for adoption but quite the contrary. One of the patterns was square in section, with the corners chamfered off; the other, octagonal in section, and the hollow space extending from the base for about two-thirds of the length of the pole, the upper third being solid, and the walls of the lower two-thirds being from 1¾ ins. to 3 ins. thick. These poles weighed approximately thirty-five hundred pounds, and were calculated to withstand any stress in any direction that could possibly be imposed upon them by a line of fifty wires, each wire coated with sufficient ice to make it one inch in diameter. The test was made in connection with two carefully-selected cedar poles of the same length (30 feet), and all were set in concrete, the bases being 3 ft. x 3 ft. x 5 ft. deep.

*Continued from the issue of June 22.

Digitized by Google

Just within the outer surface the walls of the concrete poles were reinforced with iron rods, which consisted of four ¾ ins. round bars ,each twenty-four feet long and four ⅝ ins. round bars of the same length. The poles were eight inches in diameter



Concrete and Wooden Poles, Set Up Ready for Tests.

at the top and thirteen inches at the base, having a taper of one inch to each five feet. Galvanized iron steps were screwed into wooden blocks moulded into the concrete, and holes were left for through bolts for supporting the cross-arms. The cross-arm braces were attached to the arms by through bolts in the same manner and fastened to the poles with ordinary lag bolts driven into wooden plugs, which were placed in the concrete at the proper places. The concrete poles were set to a depth of five feet in concrete with the two white cedar poles of practically the same dimensions, and, after standing long enough to permit the cement to become solid, they were tested in turn in the following manner:

An iron clevice was placed around the pole to be tested ten inches from the top, to which a wire rope was attached, leading over a pulley placed at the same height and at an equal distance from the pole so as to form a right-angle, and fastened to a differential pulley-block, which was attached to a laboratory weighing machine.

The results are fully shown in following tables, and in the accompanying diagrams and illustrations made from photographs.

Length. 30 ft. Deflection at Top.	Base Diameter. 14 in. Load Pounds.	Top Diameter. 8 in.	Depth in Concrete Anchorage. 5 ft.	Distance from Point of Fulcrum to Point of Load. 24 ft. 2 in. Time.
20 in.	1,830			11:50
22¼ in.	2,230			11:51
29 in.	2,630			11:52

56 in.	3,430			11:57
66 in.	3,494	Pole broke		12:00

Results of Test on Pole No. 4, White Cedar.

After the cement poles had been broken the reinforcement so held them that it required almost the breaking pressure to further deflect them from their slightly inclined position. The wooden poles, under strain, presented the form of an arch before breaking, and when they gave way were fractured completely; but these features were lacking in the cement poles, which were very firm and did not give until they began to crush at the ground line.

The mixture used in these cement poles was 1-3.They were constructed in cold weather, and, through some mischance, at the last moment we were unable to get suitable gravel. Pole No. 1 was found to have a defect in the casting, which is believed to be the cause of its early rupture. Pole No. 2 gave a very much better result.

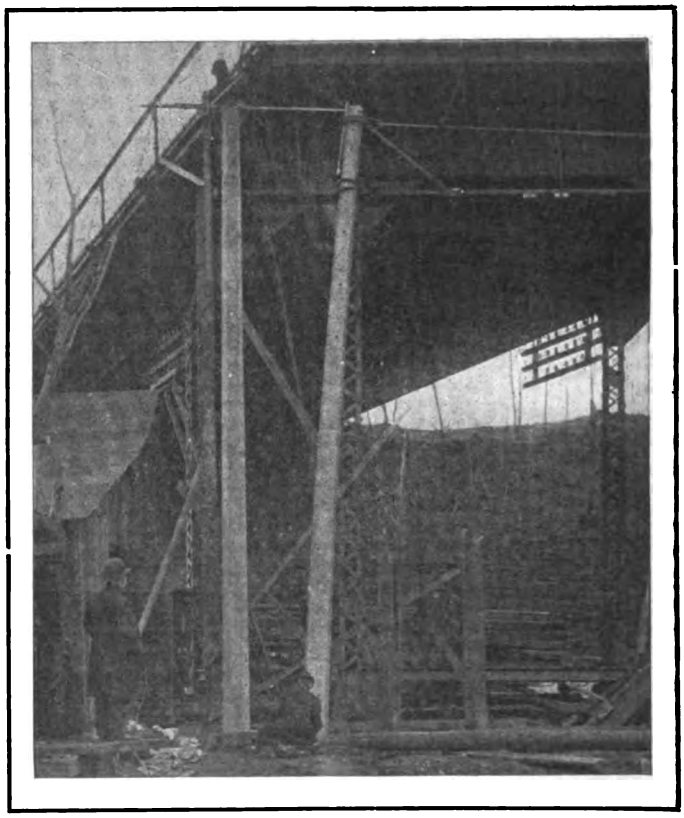
Length. 30 ft. Deflection at Top.	Base Diameter. 14 in. Load Pounds.	Top Diameter. 8 in.	Depth in Concrete Anchorage. 5 ft.	Distance from Point of Fulcrum to Point of Load. 24 ft. 2 in. Time.
14 in.	172			....
37 in.	2,230			....
47 in.	2,530	Pole broke		11:03

Result of Test on Pole No. 3, White Cedar.

The consensus of opinion seems to be that a 1-2-4 mixture is the best for use in this class of construction, and, while the experiments related above were entirely satisfactory in the development of the problem, the hollow pattern is not considered to be the highest type desirable; that is, to combine sufficient strength with the least possible weight, in order to obtain ease in handling, and that the removal from place to place may be readily feasible.

To fulfill these requirements the pole should be made with a superstructure of somewhat greater strength than the wires which it is required to support, joined to sufficiently added strength by reinforcement and added area in the base, especially at the ground line; and the base should be reinforced in the most effective way to withstand the extreme pressure at the point of fulcrum.

These conditions are all capable of mathematical computa-



Square Concrete Pole, Showing Appearance Just Before Crack No. 1, Test No. 3.

tion, and if fulfilled will give a product comparatively easy of manufacture, of reasonable cost, of greater tensile strength than the poles now in use and extremely high durability.

The argument has been advanced that the reinforced cement

Digitized by Google

pole would be very liable to damage or disruption by shock, but the fact that concrete piles, both of hollow and solid designs, are driven by pile drivers, and especially with the knowledge of the experiments at Rochester, which showed that the poles, even after they had been fractured at the surface of the foundations, required an extremely heavy pressure to produce further deflection from the positions at the time of fractures—in other words, that they were almost as stiff as when they stood upright, and continued to be so throughout the entire test—I feel that any

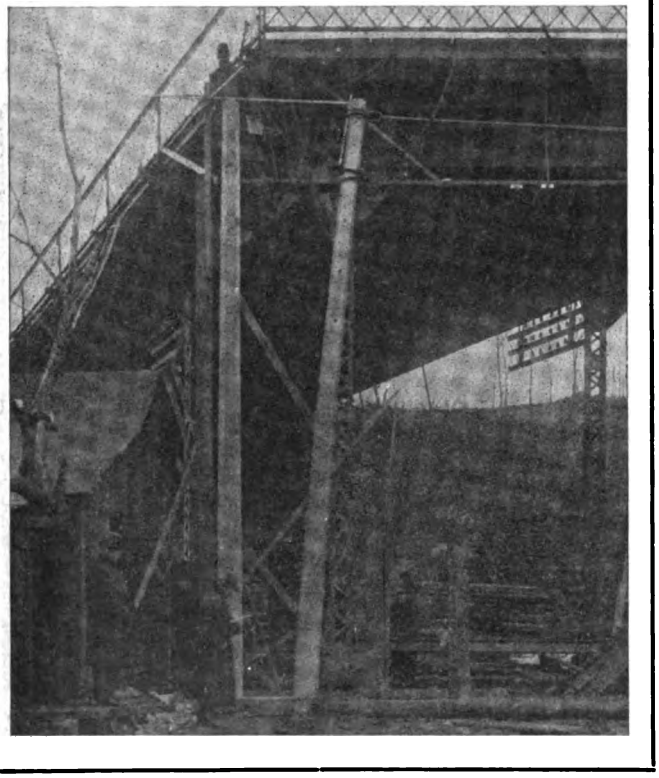
alarm at the prospect of damage by collision between the pole and anything else than a movable object that would destroy any pole of natural or manufactured composition is unfounded.

As to the insulating qualities of the concrete pole, it is hardly necessary to mention that they are superior to those demonstrated in any other pole manufactured in this country.

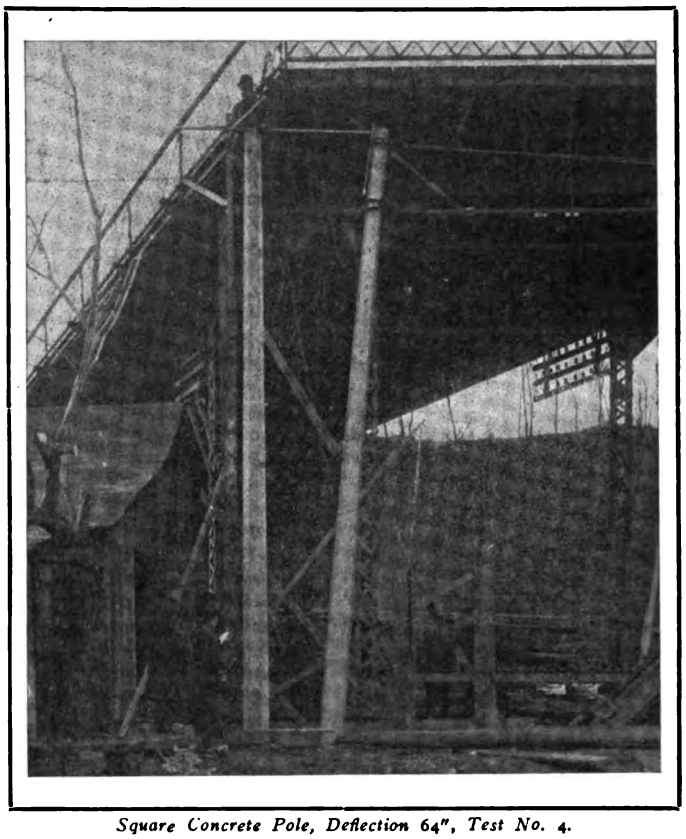
The writer has collected the following references to work done by others on concrete poles, which may be interesting to



Appearance of Square Concrete Pole, When Deflection was 22", During Test No. 4.

those who wish to trace the progress of this line of experimenting.

The "Geological Survey of Ohio," fourth series, Bulletin 2 (1904), entitled "Uses of Hydraulic Cement," by Prof. Frank Harvey Eno, of the Ohio State University, presents in an article entitled "Cement Telegraph Poles" an item of some interest, describing cement butts for wood poles that have rotted off, observing that when a pole has to replaced often only the part set-



Square Concrete Pole, Deflection 64", Test No. 4.

ting in the ground has deteriorated, and while in some country districts the pole may be cut off and reset there are many poles that must be replaced altogether, thus losing the most of the pole. To meet this contingency a cement base has been devised, octagonal in shape, with four iron strips bolted to opposite faces, extending a foot or more above the concrete. In installing this concrete base the rotten pole is sawed off, the lower end swung a little to one side, the cement base put in the place of the rotten stump and the pole is then swung into the socket formed by the iron strips and securely bolted. The pole when thus equipped is alleged to be better than new. In restumping in the manner just outlined no wiring need be touched nor telegraph communication interfered with in the least. Another feature of the use of these cement butts is that when a pole has deteriorated beyond the point of usefulness and has to be replaced a pole five feet shorter can be furnished, thus materially reducing the cost. The above mentioned article states that these butts had been in use for three years and were giving good satisfaction. The practice of restumping is largely followed in the present day, except that stumps of wood are used instead of those of concrete.

The *Cement and Engineering News* for August, 1902, mentions with strong approval the cement butts manufactured at Battle Creek, Mich., giving about the same points stated above and estimating that a saving of from 35 to 55 per cent is realized by the use of these butts in reconstruction.

Mr. Robert A. Cummings, member A. S. C. E., a consulting and constructing engineer, with offices in Pittsburg, Pa., made, in 1903, some experimental concrete telegraph poles at Hampton, Va., and found them to be quite satisfactory for ordinary purposes. The cross-section was that of an equilateral triangle with 12-inch sides at the bottom of the pole and six-inch sides at the top. The poles were thirty feet long and were reinforced with three-fourths inch vertical rods at the corners. They were stiff enough to support their own weight, a span of about twenty feet. At that time Mr. Cummings had not seen any concrete

Digitized by Google

poles in actual use, but said he had designed some large distributing poles for the New York Telephone Company.

Mr. McDonald, chief engineer of the Nashville, Chattanooga & St. Louis Railroad Company, wrote under date of January 22, 1906, that he had used concrete poles five inches square at the top and eight inches at the bottom, thirty feet long, for supporting warning straps, or ticklers, and that they have given such satisfaction that he has adopted them as standard for that purpose. The most satisfactory results were derived from these poles by attaching pipe cross-arms and no deflection at the middle ordinate of the pole was discernible.

The United Electric Railways Company of Baltimore has used cement trolley poles with good results.

Mr. Alexander Crawford Chenoweth, of Brooklyn, made in 1906 some cement poles sixty feet long and fourteen inches in diameter, calculated to withstand a direct pull of eight tons and a torsion from a yard-arm four feet long equal to four tons. These poles, erected in place, cost $2.50 a foot. They were built to carry a four-inch cable, high power, direct current transmission, the spans being five hundred feet.

Mr. J. B. McKim, superintendent of the Western Division of the Pennsylvania lines west of Pittsburg, made and set up last year in the line along the Pittsburg, Fort Wayne & Chicago Railway, near Naples, Ind., fifty-three concrete poles of very graceful proportions, in which the method of reinforcement used differs essentially from any other of the poles referred to herein. These poles are small in section and approach the minimum in weight. They have thus far given entire satisfaction and show no evidence of decay.

A notable example of recent construction of a pole of mammoth proportions is that of the reinforced concrete tower for the West Penn Railway Company's transmission line, spanning the

Monongahela River at Brownsville, Pa. This structure, which is 150 feet in height, supports cables through a span of 1,014 feet, crossing the Monongahela River. The cables are attached at an average height of 105 feet from the base of the pole, which is backed up by a shorter structure of the same construction, used as an anchorage tower. Both towers were designed as cantilever beams and are mentioned as examples of how these erections are extending. The details of construction are outlined by Mr. F. W. Scheidenhelm, who designed and constructed the towers, in an article published in the issue for May 2, 1907, of the *Engineering News*.

After a somewhat extensive series of experiments made some time since Mr. J. L. Weller, member of the Canadian Society of Civil Engineers and superintending engineer of the Welland Canal, built and erected a power line along the Welland Canal, using reinforced concrete for the manufacture of the poles. The poles in this line stand from 45 to 70 feet in height and were designed to withstand a horizontal pull at the top equivalent to 2,000 pounds. These poles have been standing in the line for more than three years and are apparently in good condition. I am informed that Mr. Weller also built a line of concrete poles 40 to 60 feet in height for the Niagara Falls Power Company and a line twelve miles long from DeCow Falls to Welland for the Hamilton Cataract Light, Power and Traction Company, the poles running from 30 to 40 feet in height above the ground. Short, heavy stubs are used to carry the line over the gorge at DeCow Falls and poles 68 feet high carry the span of 400 feet crossing the Welland River.

The poles themselves in the latter case are erected in the centre of square concrete piers on pile foundations and are capable of standing an immense strain. He also made a pair of concrete poles 150 feet in height for the Lincoln Electric Light and Power Company to carry that company's wires over the old Welland Canal at Lock Three, St. Catherines, Ont. These poles are 11 inches square at the top, 31 inches square at the base and weigh about 45 tons each. They were made, not built up, from the base like the towers at Brownsville, Pa., above referred to, but horizontally on the ground and, as is the practice with wooden poles, raised into position. Of course, their extreme height and weight made it necessary to use special apparatus for their erection. Mr. Weller's processes of reinforcement are covered by patents.

Recurring briefly to the relative merits of the reinforced concrete poles as compared with the woden pole restumped with concrete above referred to, it is thought that, while quite a considerable output of the latter have been manufactured and used, unless some more secure arrangement for uniting the two parts in the restumping process shall be adopted, and one that can be secured at a low cost, this solution of the problem of supplying a substitute for the wooden pole will not be a lasting success. Another point that may be cited as against the use of the stumped pole is that the greatly increased cost, by reason of putting on a sufficiently stable brace, will not be justified by the short additional life secured for an old pole by the restumping process.

It is expected that within a few weeks some steel poles with just enough concrete to serve as a preservative, and other steel poles covered experimentally with a cement paint, will be set in the line along the Fort Wayne Road. Experiments have also been made with several sizes of reinforced concrete cross-arms with very satisfactory results.

The tests at Rochester, Pa., were made by Mr. Robert A. Cummings, who built the poles for the Pennsylvania Railway in his yards at that point.

Managing a Telephone Company's Supply Department*

By M. R. Tracy, Storekeeper for the Toledo Home Telephone Company, Toledo, O.

THE trial balance is probably the greatest nightmare producer in the storekeeper's list of troubles, and the one most frequently neglected; but without it he merely stumbles along and never knows "where he is at." He starts from some place, generally the inventory, and wanders around in the marsh of Indefiniteness and is finally lost in the bog of Nowhere.

Some storekeepers (and the bookkeepers as well) make a fatal mistake in trying to reach a balance by balancing each card and then the difference between the total debits and total credits on the cards should be the balance in the General Books. For example, assume that the cross arm card shows something like the following items:

Received 750 @ $.24, $180.00. Issued 200 @ $.24, $48.00. Balance, $132.00.

The muslin card shows:

Received 580 yards, $.06, $34.80. Issued 200 yards, $.06, $12.00, Balance, $22.80.

This, if correct and the General Books are correct, will give the true balance; but if there should be a difference, how may one find it?

Someone asked more than twenty-three hundred years ago, "How can two walk together except they be agreed?" and this question has waited in vain these twenty-three centuries for an answer.

To "walk together" they must keep in step and the storekeeper *may* be in step with the bookkeeper in regard to his cross arm account and your muslin account. The question to be settled is whether he is so, and can he prove it? If he can, how is he going about the job?

Having gone through every voucher in which the auditor has charged or credited the warehouse with anything, and having entered credits from invoice journal as well as credit memos., a start can be made on the trial balance. Starting with debits the account will show:

DEBITS.		
Balance, May 1st, 1906	$36,845.96	
Received from Construction	986.45	
Received from Maintenance	86.40	
Purchases as per vouchers	6,864.68	
Journal vouchers (list each voucher separately)	44.86	
Total Debits		$44,828.35
CREDITS.		
Issued to Construction	$6,875.64	
Issued to Maintenance	867.85	
Issued to General Expense	36.84	
Sales as per invoice journal	324.86	
Credit Memos	36.94	
Journal vouchers (list each voucher separately)	19.79	
Total Credits		$8,164.92
Balance May 31st, 1906		$36,666.43

The items received from construction include telephones discontinued and returned to the warehouse, or any other material that has been construction material and has been discontinued.

"Received From Maintenance" would include receivers and transmitters that were once defective, but which have been repaired.

Of course these are only samples of material which might be received from Construction or from Maintenance.

A better plan is one that the writer likes to call the step by step method. Beginning with Warehouse Debits, one takes the voucher of Hard & Ware, showing all the material from this firm has been charged to the Warehouse account. Cross arm

*Concluded, from issues of June 1, 15, 22.

Digitized by Google

braces are posted to the card for braces, lag bolts to the lag bolt card, nails to nail card, and so on through *this* voucher.

Now the total of the debits on these cards is taken before returning them to the case. If this total agrees with the debit entry on the voucher the storekeeper knows that he and the bookkeeper are "walking together." They are in step. They "agree."

If it is found that there is a difference it is known that it must be between *this* voucher and the cards and can be located easily.

When this "step" is taken, and the balance agrees with the voucher, then the cards are returned to their alphabetisal place in the case and the next voucher taken.

When all the material vouchers have been entered and the Journal Vouchers, one can commence on the warehouse credits. These are made up mostly from the Monthly Reports, but must include also the Warehouse credits from the Invoice Journal and Journal Vouchers.

"Construction" in the monthly report is taken up and the cross arms entered on the credit side of the cross arm card, brackets on the bracket card, paraffine on paraffine card and so on through the whole construction part of the report.

Now before returning any of these cards to the card case, it is necessary to get their total. If this agrees with the total of Construction as shown in the report the storekeeper knows he is "in step" thus far. Now one can return the cards to their alphabetical place and begin on Maintenance. He can do the same with General Expense and so on through the entire report; the one essential thing is for the storekeeper to be sure that he and the bookkeeper "agree" at every "step."

The Toll Line Clearing House*

By J. M. Plaister.

In many sections of the country the Independent long distance lines are made up of sections owned and controlled by widely different individuals or companies, and we find it no unusual thing for as many as five or six companies to participate in the handling of one single message. With companies so situated, the question, "What shall be done with the receipts for the messages?" acquires much importance. The only satisfactory agency for handling them yet developed seems to be "The Toll Line Clearing House," or, in other words, "A Co-operative Auditor," which derives its support from the companies which operate the lines.

The organization of several of these Clearing Houses, in as many states of the middle west, has resulted in an immediate and invaluable improvement along several lines. Notably standardization of clerical methods and equitable distribution of earnings have advanced; but with these successes has come a keen appreciation of the many difficulties attendant upon the just, equitable and economical accomplishment of this great task.

Probably the one great question that first presents itself to those originating a clearing house is: "Upon what basis shall the joint earnings of interchanged business be divided?" Basing its judgment upon the experience of one of its brother organizations, the Iowa Independent Telephone Clearing House decided that the most equitable, and at the same time the most economical plan, would be to ascertain the total revenue accruing from all messages sent from one company's stations for one month, the total mileage traveled by these messages, and by dividing the revenue by the mileage, to establish an average message mile rate for that company for that month's business. The originating commission being first deducted, the message mile rate, ascertained as above, was then used in apportioning the earnings to the various lines, during which apportionment each interested company's mileage was measured on an air line between junction points.

Before the management had been using this method very long discrepancies began to appear that were very hard to locate. Diligent search, however, revealed an average inaccuracy of from one-half to one and a half per cent, due to the fact that an average message mile rate, instead of an exact one, was being used. This search also revealed that the inaccuracy, though small, always fell in the same place, instead of being equally distributed among all of the clearing companies. Furthermore, it seemed unjust to clear a message that traveled in one direction on a different basis than a message traveling in an opposite direction over exactly the same circuit, which condition was brought about by the originating company's message mile rate in each case governing the transaction.

After 18 months experimenting with this method, the Iowa Independent Telephone Clearing House is about to abandon it in favor of one which, while more expensive at the outset, will, it is believed, be ultimately cheaper, and will, beyond doubt, be at all times absolutely correct.

The managers have begun the preparation of an alphabetically arranged card system in which each card indicates the percentage due each participating company for any one message or group of messages. In determining the percentage, originating commissions, mileage earnings and terminating charges, if any, are all taken into consideration. This, while a huge task, as in Iowa alone there will be something over 4,000 cards, reduces the prorating work to a minimum, and will at once reduce the cost of the entire Clearing House operation.

If there are two possible routes for the same message, both will be shown upon the same card, as will also be shown the distribution under the night rate where it is used.

The second prime difficulty presented itself when the question of prorating the earnings from messages paid for in coupons, which are almost universally sold at a standard discount, came up. Under the message mile rate plan the coupon discount merely reduced the message mile rate by a small fraction, and thus spread the loss evenly over all clearing companies, whether they actually took part in handling that class of messages or not.

The Iowa Clearing House will in the future endeavor to designate messages of this kind, so that the discount may be deducted where it belongs; but this is very difficult of accomplishment, and but a partial remedy at the best. The advisability of gradually adjusting this matter, with the ultimate idea of entirely discontinuing the sale of coupons at a discount, should be considered by all managers.

The third and last of the problems which the writer will consider in this paper, is that of the foreign company which participates in handling long distance business. For this there are two clear and defined remedies. The first and best—secure their affiliations and support. The second—hold all clearing companies responsible for business turned onto a clearing house line, being careful, however, to give them due credit for all balances due the foreign connecting companies.

What the Iowans believe to be one of the strongest if not the very strongest point in their method of accounting is the use of numbered tickets for recording messages. This immediately lifts each message from among its fellows, and stamps it with an individuality, which is of great value. If operators are required to exchange these numbers when handling traffic the resulting accuracy and ease with which errors may be detected much more than offsets the possible slight loss of time.

*Abstract from an address at the International convention, June 5, 1907.

INTERNATIONAL INDEPENDENT TELEPHONE ASSOCIATION BULLETIN NO. 1.

In various sections of the country the Independent operators have rejected, with commendable unanimity, traffic overtures made by the opposition. The Independent spirit has dominated, everywhere, the action of individuals and State associations, and

Digitized by Google

not one break in the ranks has been reported from the Atlantic to the Pacific since the International convention in Chicago. It will be the aim of the new officers to still further develop this feeling of unity.

New Executive Committee.

The President has, after mature deliberation, and with the approval of the Advisory Board, appointed the following Executive Committee: W. B. Woodbury, Detroit, Mich.; O. C. Snider, Kansas City, Mo.; J. B. Hoge, Cleveland, Ohio; G. N. Bandy, Des Moines, Iowa; A. C. Lindemuth, Richmond, Ind.; W. E. Doolittle, Lafayette, Ind.

Removal of Headquarters.

It has been decided to remove the headquarters of the association from Cleveland, Ohio, to Chicago, Ill., the latter city being located more centrally and also more easily reached from every section of the country. However, the headquarters will remain at Cleveland until arrangements have been completed for transferring to Chicago, due announcement of which will be made.

Mr. Charles West, secretary elect, will not take active charge, but Mr. J. A. Harney, the assistant secretary, will perform the duties of secretary for the secretary.

More Publicity.

Particular attention will be paid to spreading the gospel of Independent telephony and boosting the telephone business generally by means of newspaper and magazine publicity.

Reading Notices.

Under the management of the Publicity Department suitable write-ups on almost any subject pertaining to Independent telephony will be furnished free of charge to members for reproduction locally. Write the secretary for the information wanted. Generally the matter furnished will be so prepared that local papers will gladly publish it as a news item.

Boom the Telephone Business.

Let everybody talk up the good points in the telephone business.

Monthly Financial Statement.

Commencing with Bulletin No. 2, a monthly financial statement will be published, showing the fixed charges, state of treasury, assessments, receipts and disbursements of the association.

Managers.

LOOK FOR THE SHIELD STAMP on all telephones and switchboards purchased. It is an assurance that the manufacturer is contributing to the support of the association.

Association to Incorporate.

The association will be incorporated at an early date by the Advisory Board, with a nominal capital, and the articles of association will provide that it shall not be run for profit.

Supply Department to be Discontinued.

The association has decided to discontinue the supply department as soon as the stock of "Shield" supplies now on hand can be closed out. This stock consists of Colonial lanterns, standard toll signs, large and small transparencies, inside celluloid toll signs, cardboard toll signs for construction work, gold-plated emblems, celluloid buttons, and "Shield" electrotypes for one and two color printing. Customers who have dealt with the association in the past know that the goods handled by it have always been of the best quality, unsurpassed in design and lasting properties. The discontinuance of the Supply Department offers them an opportunity of procuring "Shield" advertising essentials at reduced prices.

Managers who have hitherto failed to give "Shield" advertising a trial can now participate, at a minimum cost, in the advantage of this mode of pushing and individualizing their business.

The association has never aimed to make money out of its "Shield" supplies. It has bought goods in large quantities and sold them at a very slight advance to the Independent operators.

Bargains in "Shield" Supplies.

In order to close out the department without unreasonable delay, it has been decided to dispose of the stock on hand, which is fresh, clean and first-class throughout, at a substantial discount from previous prices—in other words, at figures much less than the individual buyer could obtain otherwise.

As this is an opportunity that will not be open very long, managers and individuals are advised to act at once. NO NEW GOODS WILL BE PURCHASED BY THE ASSOCIATION AND ORDERS WILL BE FILLED IN ORDER OF THEIR RECEIPT. From the latter rule there will be no deviation.

Price list and further particulars about discounts may be obtained upon application to the General Office at Cleveland, Ohio.

Map Work Held in Abeyance.

The Map Department has been discontinued for the time being. This branch of the Association's work has accomplished the purpose for which it was created, but has been left in such shape that it can be revived at a moment's notice, should occasion require.

Chronicle Discontinued.

The publication of the Chronicle has been discontinued. Settlement for unexpired subscriptions will be made in due time.

1907 Convention Proceedings.

All desiring copies of the last annual convention proceedings will please write the assistant secretary at once, stating number wanted. This information is necessary in order to provide a sufficient number of copies for distribution.

We have some of the 1906 report nicely bound, which will be mailed free on application, as long as the supply lasts, on receipt of 7 cents in stamps for postage.

Honorary Members.

Since the last report has been issued to the press Mr. D. A. Walker, Columbus, Ohio, and Mr. E. L. Swaine, Los Angeles, Cal., have qualified as honorary members of the association.

COMPARATIVE DATA CONCERNING THE DEVELOPMENT AND FINANCIAL GROWTH OF THE HOME TELEPHONE COMPANY, JOPLIN, MO.

FIGURES showing the advance in respect to the number of subscribers and the income derived from the exchanges of the Home Telephone Company, Joplin, Mo., we are able to present through the courtesy of Mr. Theodore Gary, president of the company. These figures are as follows:

	June 1, 1906.	June 1, 1907.	Increase 12 months.
Number of telephones, Home Telephone Co., and its combined exchanges	4,309	5,373	1,064
Income	$92,227	$121,249.32	$29,022

Increase in Net Earnings in same time	$14,150
Increase in Interest Charge in same time	4,200
Increase in Net Gain in Stock	$ 9,950

The strong support that Independent companies in this locality have received in comparison with that accorded to the Bell company is indicated by the following table:

Number of Telephones June 1, 1907.	Home.	Bell, April, 1907, Directory.
Joplin	2,642	894
Carthage	1,384	444
Webb City	816	369
Carterville	354	111
Purcell	177	...
	5,373	1,818

Although the showing for the Independents is particularly good in all cases, it is especially to be noted that at Purcell the Independent company has 177 telephones while there are none connected to the Bell lines; so that this report shows that this particular section of the state is not only strongly in favor of the Independent interests, but that certain localities are entirely undeveloped by the Bell company.

From the Editor's Viewpoint

ACCOUNTING FOR THE OUTSIDE MAN.

MEN located away from the headquarters of telephone companies which operate a number of exchanges are very likely to hold opinions concerning the subject of accounts exactly opposite to those current in the main office. The men outside deal directly with subscribers, who are looking for telephones so that they may have the service, or perhaps are looking for improvements in service after their instruments have been installed; but whichever thing is demanded their requests must be taken care of in a hurry. If a subscriber calls up the manager two or three times in a day from his office, and asks in more or less vigorous terms why the trouble on his residence instrument has not been cleared, it is safe to assume that the wire chief will send a man up there just as soon as he possibly can; and the same proposition holds good when a prospective subscriber wants to put in a telephone. As soon as the men and the goods are ready the work is rushed, as in fact it should be. In any event, and whatever else is neglected, the apparatus must be got into service and kept working, to stop complaints. In other words, the exchange force follows the line of least resistance and so avoids trouble.

This policy may in a certain fashion please a superintendent of construction or maintenance for a while, but there is a certain very harmful state of mind which is likely to be developed in many of the local officials under these circumstances. This is not merely the idea that doing the work is of more importance than making up the accounts, which may be true enough from an absolute sense. Rather is it what seems to amount at times to almost a settled plan to omit all proper accounting for materials used. The effect of omissions and inaccuracies in the material records made up by telephone employees is in many respects a fault more reprehensible, and in the long run one which threatens greater danger to the success of the organization, than would be the failure of a bookkeeper to turn in correct accounts for cash received from subscribers. Furthermore important sections of the business policy of every telephone company of considerable size are, or should be based on correct information derived from an analysis of records showing the distribution of different classes of material used throughout the plant. The results deduced from these analyses will be correct and accurate in a somewhat lower degree than the accuracy of the records themselves. Now, one who has watched a man in an exchange trying to frame up on Saturday night a set of accounts for material which has gone out at various times throughout the week will appreciate that the percentage of accuracy he attains is not very high.

The employee of a telephone company is always very much interested in his salary, and realizes, because it is measured in dollars and cents, that it is related to the financial policy of the company. What so many men fail to grasp is the absolute and intimate relation of all the work they do to the financial success which alone can make it possible for the company to pay good salaries. When they do this, and not only do their constructing and installing well, but also furnish such information as will enable the men dealing with figures to arrive at their proper relation to the actual value of the plant, the actual revenue produced by a given portion of it, the real rate at which it is depreciating, and whatever other information they desire, employees will have gone a long way in the preliminary work necessary for the raising of their own salaries.

THE COLLEGE GRADUATE IN EVIDENCE.

THIS is the season when representatives of the big telephone companies are looking over the colleges with a view of drafting into their service the best qualified young men who graduate. Also it is the time when the wary college man looks carefully over such opportunities as are presented to him, and considers what line of work will offer him the greatest prospects of remuneration and satisfaction in the doing, according to his qualifications. It is a fair field where both parties take many chances!

As to the qualifications of the men, however, it is pleasing to note that there have in the past year been at work certain influences which will no doubt be beneficial. Men from a number of the leading universities who accept employment with a telephone company after graduation will not enter the office or exchange with a perfect and complete ignorance of the nature and purpose of a telephone plant and the operation of its apparatus. They will know what to find in an exchange, a manhole or a cable box, and very possibly will know what it is there for, so that they will be in a fairly good position to go to work on it if called upon to do so. Really, this is what their special telephone courses at college should fit them for, and just so far as they do so, by just so much are they of immediate value in enabling the college man to get a start on the fellow who lacks this kind of training.

Full value from educational training is never obtained all at once. If the benefits of the training are quickly exhausted, a weakness in the plan of instruction is indicated. This is so well recognized by educators that they devote much time to teaching, on account of their value in improving mental discipline, certain subjects which will probably never be directly used by the students. Now, a telephone man who can see nothing more in the business than a relay, or group of wires, or a line of poles, will never get to the top of his profession. The man who can plan for the future will eventually hold the best position. If college training is going to be a direct help to men in preparing for this class of work, it ought to give them more training in studies which will help them in the handling of statistics and other classes of work, such as are constantly involved in studies of telephone development. Up to the present time the college courses are too closely confined to electrical and mechanical features of the telephone plant. The utility of the telephone courses is now well established, and those who have them in charge will no doubt devote their efforts in the future to perfecting them so that they will fit men for the most rapid development to positions of high responsibility.

SUMMER INSPECTIONS.

FOR the next two months or more exchange forces of instrument installers and troublemen, except in places which are temporarily crowded as summer resorts, will in most localities have very far from as much regular work to do as falls upon them in months when demands for new telephones are received more frequently, and weather conditions affecting the service are more severe. This gives considerable time which can be employed to good advantage in inspecting the plant, and bringing everything outside and inside up to the best possible condition. It is a good time for pulling up slack wires, looking over lines where the insulation is low, tightening connections in cable boxes and straightening out and numbering wires in them if they need it, adjusting contacts and tightening joints in subscribers' instruments, and in fact performing all such numerous and diversified operations which become necessary in spite of the utmost vigilance in supervising work on the plant. While this work is best done, if possible, as a sort of a stop-gap to keep a man usefully employed until he shall again be needed for new work, there is no reason why the different jobs should not be taken up systematically.

Probably as effective a plan as any is to divide the work into classes according to its nature, such as instruments, cable boxes, etc., and then have a competent man take up each class in turn and make inspections by districts. He can take notes and turn these over to a force of men, who may go through each district and make just such repairs as are necessary; and when they are finished the notes will still be available for a final checking inspection, which should show that the section of the plant which has been covered is in the very best condition.

The Way of the Law

CONDUCTED BY A. H. McMILLAN.

THE NECESSITY OF FRANCHISES IN NEBRASKA MUNICIPALITIES.

Our lawyer tells us that one must have a franchise to run a telephone line through the town, also one to operate a switchboard, also one to run a drop from the terminal pole to the switchboard. He also says that a franchise is no good in a town under 5,000 population. Is this right? If one must have a franchise to operate a switchboard, how long must it be idle before the franchise is void? Any other information on this point will be acceptable. L. M., Nebraska.

THE advice of your lawyer is correct in all particulars above mentioned. The State law of Nebraska provides that a company doing business in the State or incorporated in it is given a right of way along the public roads of the State for the erection of poles and wires. Compiled Statutes, 1895, Ch. 89a, Section 14. It has been held that the words "public roads," as used in this State, do not include the streets and alleys of a municipal corporation and that, therefore, it is necessary for a telephone company to have a franchise from the municipality before it can erect its poles and stretch its wires therein. The case in which this was decided was one brought by the Nebraska Telephone Company against the Western Independent Long Distance Telephone Company (95 N. W., 18) to restrain the latter from constructing its lines in the streets of Louisville, Neb., in such a way as to interfere with the plaintiff's occupation of the streets. The defense was the alleged absence of right in the plaintiff to occupy the streets of the village. The plaintiff based its right to use the village streets not upon any grant from the village, but solely on the State law above quoted. The court held that the complainant company was using the streets without right.

You also ask how long a switchboard must be idle before the franchise authorizing its use is void. A franchise never becomes void until declared so by the authority which granted it. If the company holding the franchise neglects to operate under it for such a period of time as to indicate that it is the company's intention not to operate any more the franchise may then be declared void. This is in the absence in the franchise of any provisions to the contrary. There is no fixed time, the time varying under the circumstances of the case and depending somewhat on whether the company is making any preparation to continue operations or not.

OHIO DECISION ON HOUSE MOVERS.

We understand that there has been a recent decision of the Supreme Court in regard to telephone companies collecting for work or damage incurred by house movers.

The case cited was taken from Perry County, Ohio. If this decision has appeared in THE AMERICAN TELEPHONE JOURNAL, it has escaped my notice; however, we would like the sum and substance of the decision as we have been collecting, through the City Clerk, for the labor incurred by moving cables or drop wires in the way of houses being moved. A. J. C.

IF there has been a recent decision of the Ohio Supreme Court on the question of the rights of telephone companies and house movers it has not yet been published in reports of legal decisions. It has not appeared in THE AMERICAN TELEPHONE JOURNAL as yet and will not until officially published. As soon as it does appear mention of it will be made in our columns.

COMPANY CANNOT BE RESTRAINED FROM ACTING UNDER FRANCHISE.

IN 1884 the city of Salem, Ore., granted to the predecessor of the Pacific States Telephone Company a fifty-year franchise to erect, maintain and operate a telephone system in the city, in consideration of which the city was to use the poles and conduits free for fire alarm and police telegraphy and the company was to furnish the fire department with telephones in the engine house and city hall free of charge. In 1901 a controversy arose between the company and the city respecting certain taxes in settlement of which it was agreed that the company should pay the city $200 annually for ten years and the city should not, during such term, grant any franchise for a telephone system upon terms more favorable than those under which the plaintiff operated. In 1905 the city or council granted to one Sumner a twenty-five year franchise for a telephone system on certain terms and conditions and a few days afterward the plaintiff commenced suit against the city and Sumner to enjoin the latter from constructing and operating his proposed system on the ground that his franchise was more favorable than the one under which the plaintiff was operating and therefore in violation of its contract with the city.

The court refused the plaintiff company the relief it sought, for the reason that it had failed to prove that the franchise to Sumner was more favorable than its own. The court remarked that the two franchises differed so essentially that it was practically impossible to determine with any degree of certaintv whether one was more favorable than the other. The plaintiff was allowed to support its wires on poles within the fire district, while the defendant was compelled to put his underground. The plaintiff had to furnish the city three telephones and the defendant five. The plaintiff had to pay $200 a year for ten years and the defendant 1 per cent on gross receipts during the lifetime of the franchise except for the first year. Pacific States Tel. Co. vs. City of Salem, 89 Pac., 145.

FARMER HAS RIGHT TO CONTROL LINE BUILT BY HIM.

IN the case of the Formers' and Merchants' Telephone Company vs. John Noland, the circuit court at Coshocton, Ohio, found for the defendant, sustaining the judgment of the lower court.

The case is briefly stated as follows: Noland built one mile of the line of the Farmers' and Merchants' Telephone Company in the vicinity of Frazeysburg. Other farmers did likewise, and later S. E. Kisner, who owned one mile of the line, sold his rights to the plaintiff company, and it is alleged at the same time transferred to the purchasers the title to all the farmers' lines in that vicinity.

Noland had bought his telephone and paid for the material and labor of constructing his line and claimed to own it. The company, without his consent, attached nine telephones to Noland's mile of the line and then sent Noland a bill for $48 rental. It sued to recover this amount, and in a cross-petition Noland set up a claim for rentals for the nine telephones attached to his line. Noland won his suit.

AGREEMENT FOR OCCUPATION OF LAND BY POLES NEED NOT BE RECORDED.

THE Court of Appeals of Kentucky has held that an agreement giving the right to erect poles upon land need not be recorded in order to give it legal effect where the company is in actual occupancy of the land. The reason for this is that the visible occupation of the land constitutes due notice to any purchaser of the company's rights. This decision was made in an action brought by Dr. A. S. Denton against the Cumberland Telegraph & Telephone Company. The action was brought for an injunction to restrain the company from further use of the land, the complainant alleging that the line of poles had been erected before his purchase; that there was no record of any contract to the company of any right of way, and that at the time of his purchase he had no notice of any interest held by the company in the land. On the grounds above stated the petition was dismissed. The complainant did not allege that the company was wrongfully in possession or that it entered upon the land without right, and in the absence of such allegation the court held that the presumption is that the premises were rightfully occupied. Denton vs. Cumberland Tel. & Tel. Co., 96 S. W., 1112.

From Here and There

ANNUAL MEETINGS OF CUYAHOGA AND UNITED STATES TELEPHONE COMPANIES AT CLEVELAND.

AT Cleveland, on June 17, the stockholders' meeting of the Cuyahoga and United States Telephone companies, postponed from last February, were held. It is announced that a special meeting of the stockholders will be called for July 27 to vote an increase in the common stock to the extent of $500,000.

Among the changes in the board of directors were the election of C. Y. McVey and Norman C. McLoud, of Cleveland, and Clarence Brown, of Toledo, to succeed Col. F. S. Dickson, of Cleveland, and J. K. Secor and Williard P. Robinson, of Toledo. The officers of the Cuyahoga company were re-elected without change. W. L. Cary, Jr., and M. C. Harvey, of Cleveland, and H. R. Ashbrook, of Toledo, were elected to the board of directors of the United States Company, succeeding H. R. Newcomb, Calvary Morris and C. A. Otis. Mr. Cary was elected secretary of the United States, succeeding James B. Hoge, who formerly held that position, he having been given the title of vice president.

FIFTH CONVENTION TO BE HELD JULY 9TH AND 10TH BY VERMONT AND NEW HAMPSHIRE INDEPENDENT TELEPHONE ASSOCIATION.

INDEPENDENT telephone men of Vermont and New Hampshire will hold their fifth convention at Hotel Low, Bradford, Vt., on July 9th and 10th, two days having been set aside for the gathering in order to give the manufacturers an opportunity to make exhibits. On the evening of Tuesday, July 9th, a banquet will be served, and each member is expected to contribute to the success and pleasure of the gathering by bringing a lady, as is the regular custom at these association meetings. Papers covering many practical features of telephone development and work, as well as interesting happenings in the local field, will be read by well known members. Any further information desired can be obtained by writing to G. W. Buzzell, secretary, at St. Johnsbury, Vt.

FIVE THOUSAND DOLLAR SUIT NETS ONE CENT DAMAGES.

AN attorney at Memphis, Tenn., had a telephone in his office, but when a client, who was under arrest, asked for his number, she was told he had no telephone. In consequence, the client, a widow, was found guilty in justice court in the absence of her legal advisor. The attorney brought suit in the United States District Court at Memphis for $5,000 damages. The jury brought in a verdict in his favor, but assessed the damages at one cent.

WOOD PRESERVATION BY CREOSOTE DISCUSSED IN A NEW BULLETIN OF UNITED STATES DEPARTMENT OF AGRICULTURE.

FOREST Service circular No. 98, issued May 9th, 1907, by Gellert Alleman, Prof. of Chemistry in Swarthmore College, gives some very interesting discussions based on investigations of the quantity and character of creosote found in certain specimens of well preserved timber. Methods of extracting the creosote from the timber and of analyzing the extracted creosote are described. Some useful conclusions are drawn from the results obtained in the investigations. A table at the close of the report summarizes the results obtained.

Interested persons can obtain copies of this bulletin free of charge by writing to The Forester, U. S. Dept. of Agriculture, Washington, D. C.

VALUABLE INSTRUCTIONS FOR OUTSIDE MEN.

CARELESSNESS on the part of installers and repair men is likely to be responsible for about one-half of the trouble which affects telephone exechanges. The *Central Union News* has recently printed a set of instructions which have been posted in the work and store room of the exchange at Anderson, Ind., as follows:

Don't carry instruments by the cords.
Don't carry them with the mouthpieces on them.
Don't tear one up to repair another.
Don't install one looking shabby—clean it up.
Don't leave cable boxes or can tops open.
Don't use pliers in can tops.
Don't wear spurs near cables.
Don't fail to solder connections.
Don't fail to report unsatisfactory conditions to your superior.

These instructions seem to fill the bill admirably, and are worthy of adoption by managers of many other exchanges.

VALIDITY OF TELEPHONE ORDERS.

AT Monroe, Michigan, the circuit court has held that a telephone order to a broker to purchase stock cannot be enforced in the state. The question arose in the case of William Mass vs. George A. Hastreiter. Hastreiter agreed, over the telephone, to purchase thirty shares of stock in the Michigan Fire & Marine Insurance Company, at seventy-one dollars a share, directing that the stock be sent to his bank in Ann Arbor. The San Francisco earthquake occurred the next day and Hastreiter refused to accept the stock. The court held the transaction void, there being no tangible evidence to show it had taken place.

LOUISVILLE ACCOUNTANT EXAMINES BOOKS OF BELL TELEPHONE COMPANY.

W. J. MUNSTER, of Cincinnati, an expert accountant, is in Nashville, Tenn., for the purpose of making an examination of the books of the Cumberland Telephone & Telegraph Company for the special telephone rate committee of Louisville, Ky. The company agreed to put its rates at a reasonable figure based upon the cost of maintenance. To get at the cost of maintenance the committee demanded the books of the company and the expert accountant was employed to examine them. The Cumberland has had a long fight with the Louisville authorities on matters of rates, privileges, service, etc., and the committee of the city council and another from the Board of Trade are now engaged in probing the case.

THE ATLANTIC TELEPHONE CO. HAS NOT BEEN GRANTED A FRANCHISE IN NEW YORK CITY.

At the last meeting of the Board of Estimate and Apportionment held June 21, the telephone franchise applications were referred to a committee consisting of the Comptroller, the Corporation Counsel and the Chief Engineer of the Board. This committee will not be able to report until after the summer vacation.

Your Question—Our Answer

HOME MADE MAGNET METER.—(878.)

Frequently we have inspectors and instrument repair men bring into the office receivers in which the magnets are weakened to such an extent that they do not operate sufficiently well to give good service. It has been customary with us to test magnets of a receiver with a weight, considering a receiver whose magnets would not lift a bar of given weight as too weak for telephone service.

The writer, however, has noted in a number of cases that one pole of the receiver magnet would be practically "dead," while the other pole would be magnetized to its fullest capacity. This is a peculiar trouble, the reason for which we have not been able to determine upon, owing to our supposition having been that the two poles of a magnet were always of equal strength. However, that which we particularly desire to know is of some method of testing magnets which will give us an approximate idea as to their strength so that we may have some basis upon which to go in determining whether receivers are up to their full efficiency or not. If you can assist us in this matter, we shall be indeed grateful.

H. B. H., Washington.

In relation to the peculiar trouble which you are experiencing in your receivers we would suggest that this is in all probability due to the fact that in a number of bi-polar receivers as manufactured to-day the magnets are made of two bar magnets instead of the customary one piece of steel of the familiar "horse-shoe" shape. It sometimes occurs that one of these bar magnets is of softer steel than the other, and as they are charged together, usually by the wiping process, one bar will receive its full quota of magnetism while the other will remain practically "dead." However, as you state, this is likely to be of very infrequent occurrence.

A method of testing magnets with some degree of accuracy and one which will give you a comparative reading of magnet strengths is by the use of a magnet meter which may be constructed very cheaply and quickly in your workshop. The requisite materials for the construction of one of these instruments are: a fully charged heavy, steel magnet, such as would be used in a voltmeter, or one taken from an ordinary high grade five bar hand generator, a piece of soft iron about one inch wide and of a length equal to the width of the generator magnet, a cone shaped piece of soft iron, an indicator which may be made out of brass or copper wire, a scale of paper, a small retaining cabinet, a piece of glass, and two small coiled steel springs.

Fig. 878*a* shows the relative positions of the various apparatus mentioned, while 878*b* shows a side elevation of this entire equipment.

In using this device place one pole of the magnet to be tested against the larger end of the cone shaped piece of soft iron,

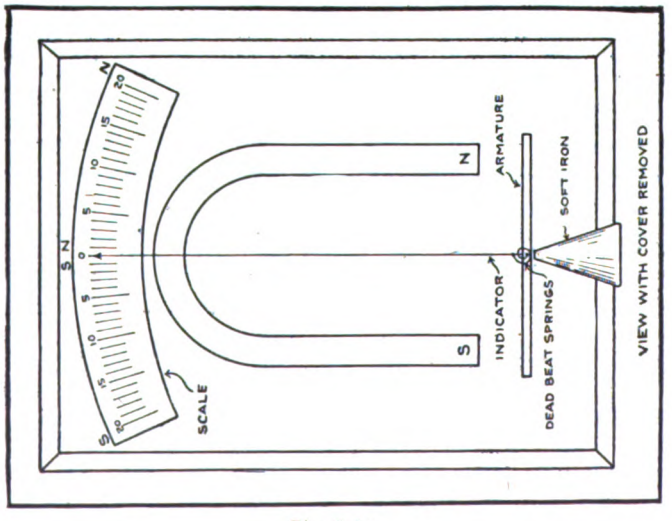

Fig. 878a.

the point of which reaches directly before the exact center of the soft iron armature. The strength of this pole of the magnet tends to neutralize the pulling effect of the like pole of the magnet in the magnet-meter so that the force of the opposite pole of the magnet exerts a greater power, and consequently moves the indicator in the opposite direction.

Of course, you will appreciate that the readings of the indicator do not indicate any particular units of power or magnetism. They are simply comparative.

The basis upon which you will test your receivers would be by testing the different poles of a receiver of which you were positive

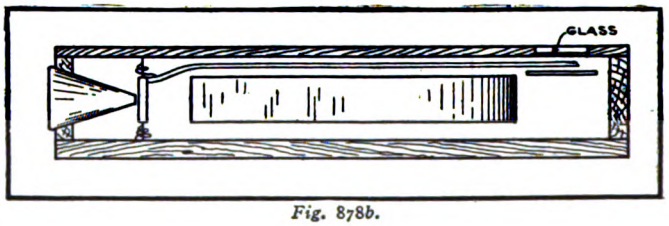

Fig. 878b.

as to the magnet strength, and note the deflection. This would then be your standard, and magnets being tested showing a smaller deflection in either direction would immediately indicate that their strength is not as great, and vice versa.

The object in using a cone shaped piece of soft iron for transmitting the magnetism to the armature is to effect as even distribution as is possible in the armature, but would not be possible were one to place the magnet to be tested directly in front of the armature itself.

It will be well in constructing this magnet meter to use two small coiled pieces of spring steel which force a tension in the opposite direction, fastened to the indicator shaft to act as a "dead beat" attachment for the indicator, so that it may immediately come to rest upon reaching the proper point of indication. This will materially assist in making quick readings.

COMMON BATTERY LINE.—(879.)

We have a line from a common battery exchange that runs through a cable about a half a mile then jumps from the cable head across the top of a large flat roofed building, bare iron wire being used, the pair of wires laid within three inches of the top of the roof. There is a truss rod to assist in supporting the roof that runs over the wires at about three inches distance, thus leaving a play of about three inches between the truss rod, the wires and the roof. The line is fastened on each side of the roof with common No. 4 knobs. After this line had been up for about ten days there were complaints of a ground on the line about nine o'clock at night. We have sent our trouble man out about eight o'clock next morning in each case of complaint but before arriving at the subscriber's station the ground would be cleared. The trouble man would generally get as far as the cable pole and make a test and it would test beyond the cable. There are iron sewer pipes ventilating from the cellar of this building up through the roof, and on dark, cold days the line stays grounded. Can you give us any suggestions that will help us in locating this ground and just why it should act in the above manner? We have a C. B. system.

W. H. K.

Your trouble is due to the contraction and expansion of the line wire coincident with the rise and fall of the temperature. As you do not give the length or size of the wire in the line under discussion we assume from the data given it to be of number twelve and of a span one hundred and fifty feet, having a stress of one hundred pounds at fifty degrees.

Under these conditions a rise in temperature to seventy-five degrees would lower the sag about four and one-fourth inches. We would advise that you fasten your wires to the truss by means of a porcelain knob insulator.

RINGING TROUBLE ON GROUNDED LINE.—(880.)

Sometimes one of our grounded lines rings all right, and then again the bells will barely tinkle. Can you tell us the trouble?

It might be poor joints between sections of wire, poor grounds, in dry earth which are, however, good enough in wet weather, or swinging grounds to trees, etc. Test for grounds first, and if you do not find the trouble to be due to them go along the line and test the joints.

MASON MULTI-DISCHARGE LIGHTNING ARRESTER

Patented August 9, 1904.

Digitized by Google

In the Field of Invention

CONDUIT TRAVELLER.

L. D. Shaffer, Paint Borough, Pa., patent 850,797, April 16, 1907.

This invention comprises an arrangement of two travellers, *A* and *B*, so arranged on the rod *C* that by proper manipulation of the ropes *A'* and *B'* the grippers *E* and *D* alternately grip against the inner walls of the conduit. Further manipulation

causes a forward movement of the traveller by the alternate advance of the grippers. The object of the apparatus is to "thread" the conduit with a rope or steel strand by means of which the cable may be drawn into the conduit.

SELECTIVE LOCK-OUT SYSTEM.

R. C. M. Hastings and T. Matheny, Athens, Ohio, patent 856,146; June 4, 1907.

This patent is descriptive of a selective lock-out system for magneto party lines. Instruments are provided with two sets of relays, aside from the ratchet impulse governor, for the purpose of locking in an unoperative position both the receiver hooks and the ringer clapper rods on all of the instruments on the line except the one with which connection is desired.

MICROPHONE.

N. H. Holland, Chicago, patent 855,458, June 4, 1907, assigned to E. A. Stolz, Chicago.

This patent describes a transmitter so constructed as to increase, in a receiver, the volume of sound to which it is subjected. It is designed particularly for the use of deaf persons in conjunction with a battery and receiver carried by the deaf person.

LINEMAN'S TEST SET.

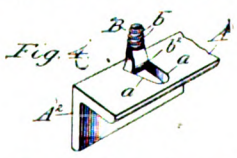
J. M. Miller and C. J. Murray, Newtown Square, Pa., patent 855,117; May 28, 1907.

The device described in this patent consists of a magneto generator, a ringer movement, an induction coil, battery, a switch, and two jacks, one for the transmitter, the other for the receiver. The entire apparatus is so connected and arranged that the lineman may signal the exchange by depressing the switch and operating the generator and by allowing the switch to return to normal, may converse with some one at the other end of the line.

METAL CROSS ARM.

H. W. Smith, Worcester, Mass., patent 848,269, March 26, 1907.

The cross arm described in this patent is formed by stamping an angle iron section of the proper length at suitable intervals, having the stamped portion extend upward and rounding the



edges so as to form the insulator pin. *A* is the angle iron, the horizontal section of which is stamped at *a* to form the pin *B*.

Suitable holes are provided in the vertical portion A^2 for securing the arm upon the pole by means of bolts in the usual manner.

AUTOMATIC CALLING DEVICE.

W. O. Beck, Chicago, patent 856,386, June 11, 1907, assigned to W. E. Co.

This patent describes a device the purpose of which is to control the impulses of current on the line of an automatic telephone system for the operation of the selector. It comprises an indicator, a set of electro-magnets and a means for opening and closing the circuit. The indicator having been set to the number desired, returns to normal position. The return movement is, however, regulated by the electro-magnets and an escapement attachment.

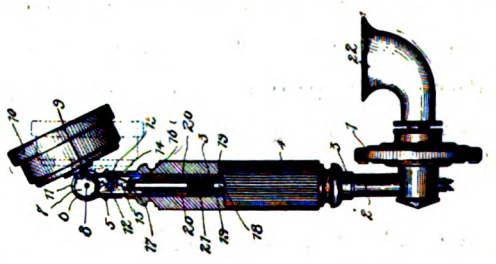
It is the purpose of the inventor to provide a calling device in which the controlling apparatus will operate at all times with a uniform speed, so that there may be no opportunity of making the wrong selection.

HAND MICRO-TELEPHONE.

A. Stromberg, Chicago, patent 854,439, May 21, 1907, assigned to S.-C. Tel. Mfg. Co.

This invention relates to a form of hand telephone having the receiver 10 and transmitter 1 mounted on opposite ends of the handle bar 4.

The particular feature which is given prominence in the patent is the construction of the means by which the switch



springs are actuated. This feature provides that under normal conditions the receiver rests at an obtuse angle with the handle bar. When placed against the ear and the transmitter brought around into position for conversation the receiver 10 moves in the joint 11, thus causing a movement of the lever 12, which in turn moves the roller 15, thus spreading the springs 19 to make contact with the springs 20. This action completes the circuit in which the telephone is included.

SPRING-JACK-MOUNTING PLATE.

H. P. Hibbard, Chicago, patent 856,955, June 11, 1907, assigned to W. E. Co.

This patent is descriptive of a mounting plate for spring jacks, having a clamping lug at each end. These lugs are formed of strips extending from the upper edges of the ends, outwardly, downwardly and inwardly back to the ends. The strips are integral with the plate ends.

ADJUSTABLE RECEIVER.

K. M. Turner, New York, N. Y., patent 855,911, June 14, 1907; assigned to General Acoustic Co.

The receiver described in this patent is constructed with a view of adjusting the loudness of tone of the receiver to the hearing powers of different deaf persons.

In the retaining case of the receiver is enclosed a turn button switch, the points of which are tapped unto various points of the windings of the receiver electro-magnets. The movement of this switch has the effect of cutting in or out certain portions of the of the windings and consequently increases or decreases the amplitude of the vibrations of the receiver diaphragm.

LIGHTNING ARRESTER.

F. B. Cook, Chicago, patent 838,304, Dec. 11, 1906.

This invention relates to the use of the customary carbon blocks, between which is placed instead of a piece of mica a dielectric of some material that will, in the case of a continued arc passing between the carbon blocks, soften and allow the blocks to come together and thus make firm contact one with the other. The dielectric has a side portion cut away approximately to the centre. This is by way of providing an opening through which small particles of carbon dust may pass so that no short circuit may result when the arc is of but short duration.

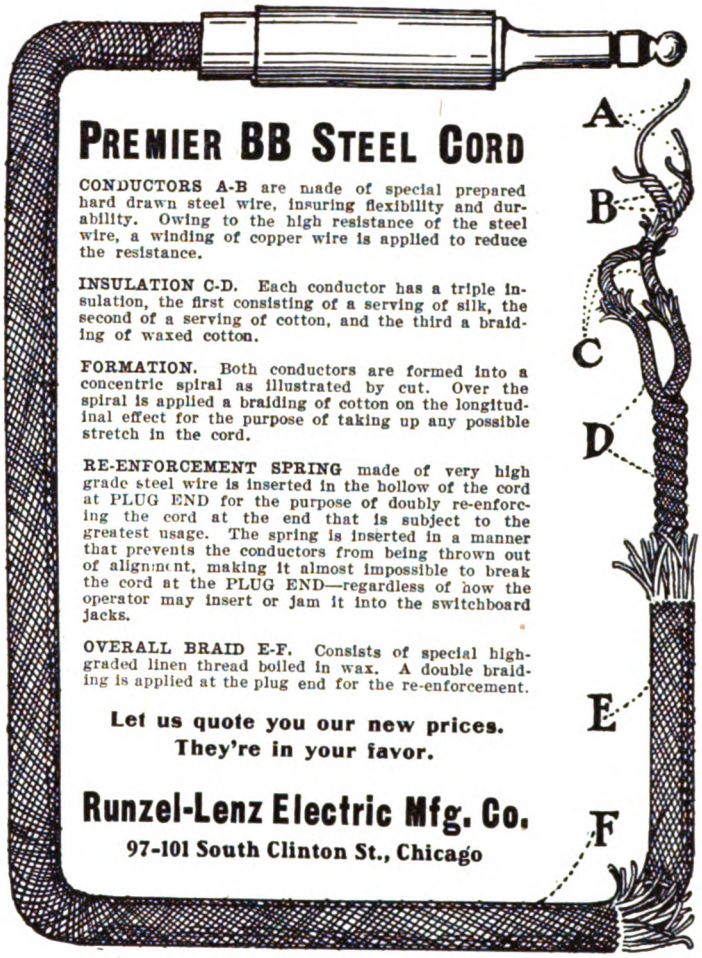
CHANCE MANUFACTURING CO.
CENTRALIA, MO.



PREMIER BB STEEL CORD

CONDUCTORS A-B are made of special prepared hard drawn steel wire, insuring flexibility and durability. Owing to the high resistance of the steel wire, a winding of copper wire is applied to reduce the resistance.

INSULATION C-D. Each conductor has a triple insulation, the first consisting of a serving of silk, the second of a serving of cotton, and the third a braiding of waxed cotton.

FORMATION. Both conductors are formed into a concentric spiral as illustrated by cut. Over the spiral is applied a braiding of cotton on the longitudinal effect for the purpose of taking up any possible stretch in the cord.

RE-ENFORCEMENT SPRING made of very high grade steel wire is inserted in the hollow of the cord at PLUG END for the purpose of doubly re-enforcing the cord at the end that is subject to the greatest usage. The spring is inserted in a manner that prevents the conductors from being thrown out of alignment, making it almost impossible to break the cord at the PLUG END—regardless of how the operator may insert or jam it into the switchboard jacks.

OVERALL BRAID E-F. Consists of special high-graded linen thread boiled in wax. A double braiding is applied at the plug end for the re-enforcement.

Let us quote you our new prices.
They're in your favor.

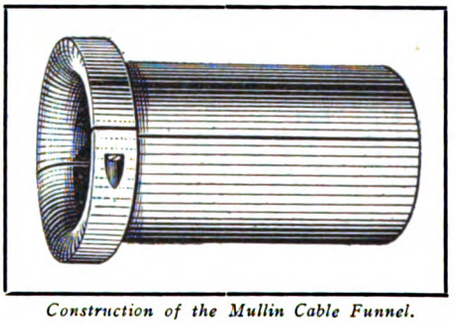
News for the Buyers

THE MULLIN CABLE FUNNEL.

WHILE cable is being pulled into ducts, it is customary to use some sort of a protective device to prevent abrasion of the lead covering against the edges of the ducts. Various appliances have been tried, but many of them are inefficient or inconvenient to carry about. The necessity for an economical and reliable protector was recognized by Mr. Mullin, and the device illustrated upon this page, he believes, will be found to work satisfactorily. As its cost is low, he states that telephone companies are laying in supplies of them to use wherever cable is being pulled in. The Colman J. Mullin Co. manufactures a great many other specialties designed for practical outside work and will be pleased to send its catalogue or any desired information upon receipt of a request mailed to its office at 430 Kent avenue, Brooklyn, N. Y.



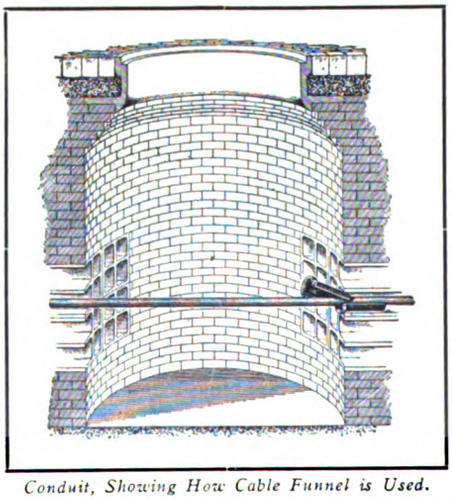
Construction of the Mullin Cable Funnel.

COMMERCIAL ELECTRICAL SUPPLY CO., St. Louis, Mo., believes that every telephone company which has not yet begun to equip its operating rooms, offices and pay station booths with electric fans ought to do so at once. It announces a good proposition on both direct current and alternating current fans on a recently issued folder, which it will be pleased to send out on receipt of a request.

THE TRUMBULL ELECTRIC MFG. COMPANY, Plainville, Conn., has just issued one of its very attractive booklets bearing the title "The Power of Persistent Effort." The pith of the story is that switch users should not be misled by persistent hammering to buy cheap material, and should investigate for themselves the features of the goods they intend to purchase. The company intends to sell the well-known Trumbull switches on their merits, and invites the intending purchaser to make the most careful inquiries.

THE VALENTINE-CLARK CO., 234 La Salle street, Chicago, Ill., is sending out a circular which gives some good points about cedar poles. Incidentally it calls attention to the fact that the company's shipping facilities are so good that it can arrange for the quickest possible deliveries, thus precluding difficulties arising from holding up construction to await the receipt of poles.

UNIVERSAL POLE AND POST PRESERVING CO., Circleville, O., has prepared a booklet containing an article on decay in poles, by Dr. Howard Jones. This gives a number of very interesting facts about the process of decay in wood. Copies may be obtained, without charge, by writing to the company.



Conduit, Showing How Cable Funnel is Used.

ROCHESTER SEWER PIPE CO., 545 Oak street, Rochester, N. Y., is sending out some very interesting cards about conduits, most of them telling some of the qualities a good conduit should have.

AMERICAN CONDUIT COMPANY, 140 Nassau street, New York, has issued four bulletins bearing the numbers 215, 217, 220 and 223, which should be in the hands of every telephone man who has to install conduits enclosed in concrete, or in fact for any concrete work. These bulletins are in the shape of small cards, bearing curves worked out to show respectively the cost of stone, cement, sand and labor per cubic yard of concrete. Directions for use are also printed on the same card.

The company states that it is frequently asked "What does it cost to lay conduits?" If a company installing conduits expects to enclose them in concrete these bulletins will enable it to exactly determine the cost of the work. They are equally good for estimating the cost of concrete for use in foundations, or almost any other type of concrete work. Requests for them have been received from all over the country, and even from places as far away as China.

DURANT ELECTRIC SUPPLIES CO., 56 Fifth avenue, Chicago, Ill., is sending out cards giving prices on its "Ironite" duplex drop wire, a twin B. B. iron wire with rubber covering and 5-32" insulating compound, the whole surrounded by a twisted braid.

EVERSTICK ANCHOR CO., 17 South Main street, St. Louis, Mo., has prepared a folder giving testimonials as to the efficiency of its anchors from a number of well known telephone companies. A number of interesting points about anchors are included in the sheet, which will be sent to all interested persons.

BELDEN MFG. CO., 194 Michigan street, Chicago, Ill., in its catalogue No. 3 lists a great variety of wire, including German silver resistance wire, which can be used in making various classes of testing apparatus, telephone switchboard wire and jumper wire, self-fluxing solders and a full line of cord for switchboard and instrument connections. Cotton sleeving for insulating short strands of bare wire used in switchboards and instruments and various other specialties are also described. In addition to the information about the specialties sold by the company, a number of useful tables are included.

JOHN RUSCOE & CO., LTD., Manchester, England, manufacture a cable reel carriage which presents an especially sturdy appearance, being apparently designed to bear without possibility of breakdown the load of the very largest reels used. It is a two-wheeled vehicle, arranged to facilitate loading and unloading, as well as the unreeling of cable. It is claimed that its use has so reduced the cost of labor for these items that it is being generally adopted by municipal corporations and prominent contractors in Great Britain.

EWING-MERKLE ELECTRIC CO., St. Louis, Mo., is sending out folders which show how the "Gyrofan" is adapted to its object of maintaining a first class circulation of air. The company recommends it for use in operating rooms, offices and also pay station booths. Those who are interested should write for the information embodied in a recently issued circular without delay, as this is the season of rush orders.

JULIUS ANDRAE & SONS CO., 99 West Water street, Milwaukee, Wis., has prepared a folder showing the three steps necessary for setting the Hercules Anchor and they also indicate the reason why the strain-resisting power of this anchor is so great. Copies of the booklet may be obtained by writing to the company.

Good News—And It's All New

Rankin, Tarkio; Gen. A. A. Goddard, Topeka, Kan., and Theo. Gary, Macon.

LEBANON, N. J.—The officers of the Lebanon Telephone Company are: S. J. Shurtz, president and treasurer; George Clark, vice-president; E. W. Sutton, general manager; O. A. Farley, secretary.

SILVER CITY, NEW MEXICO.—The following officers have been elected by the Grant County Telephone Company: W. D. Murray, president; J. W. Bible, vice president; Clyde Smith, secretary, treasurer and general manager. This company has recently entered into a contract with the government to build a metallic circuit line from its sub-station at Pinos Altos across the Gila National Forest Reserve to the mining camps of Mogollon, Cooney and Alma, New Mexico, a distance of ninety miles.

SILVER CITY, NEW MEXICO.—The Silver City, El Paso and Southwest Telephone Company has elected the following officers: W. D. Murray, Central, N. M., president; John H. Morgan, El Paso, Tex., general manager; Clyde Smith, Silver City, N. M., secretary and treasurer.

PENN YAN, N. Y.—The newly-elected officers of the Yates County Telephone & Telegraph Company are Charles E. Guile, president; Walter B. Tower, vice-president; Frank C. Spencer, secretary; David Miller, treasurer.

SCHENECTADY, N. Y.—The following officers have been elected by the Schenectady Home Telephone Company: Charles F. Veeder, president; I. H. Griswold, vice-president; E. S. Kellogg, treasurer; J. T. Bellanger, secretary and manager.

RAVENNA, N. Y.—The officers for the Ravenna & Medway Telephone Company are: President, William C. Harden; vice-president, Arthur Hartt; secretary, Ernest L. Haight; construction manager, Clifton Bedell; treasurer, Harrie McK. Curtis.

GERMANTOWN, O.—At a meeting of the stockholders of the Germantown Telephone Company the following directors were elected: John C. Schaeffer, C. W. Hildabolt, Chas. T. Emminger, John Pflinspach and Geo. I. Coleman.

NORWALK, O.—The following officers and directors have been elected by the Oil Belt Telephone Company: L. H. McDonald, president; W. W. Graham, vice president; H. E. Graham, secretary and treasurer; H. E. Graham, L. H. McDonald, W. W. Graham, E. N. Graham and J. R. McKnight, directors.

STRAWBERRY RIDGE, PA.—The People's Telephone Company at its meeting at this city elected Charles F. Bomboy, president; Dr. J. E. Shuman, vice-president; R. A. Cox, secretary; A. W. Lowery, treasurer. Directors are Levi Ortner, Miles Derr, S. S. Peeling, Boyd Trescott, B. C. Dunham, S. C. Hartman, Charles Shires, Lloyd Bomboy and Allison Essick.

WASHTUCNA, WASH.—The Ritzville, Washtucna High-Line Telephone Company has elected the following officers: President, William Snyder, Ritzville; secretary, O. Leonard, Bemis; treasurer, E. H. Herring, Bemis.

ST. MARTINS, N. B., CANADA.—At a recent meeting of the shareholders of the St. Martins Telephone Company, the following officers and directors were elected: C. M. Bostwick, president; W. E. Skillen, vice-president; W. M. Jarvis, R. O. Stockton and C. D. Trueman, directors.

MISCELLANEOUS.

SAN FRANCISCO, CAL.—Amended articles of incorporation have been filed by the Direct Line Telephone Company, and the following directors elected: Joseph A. Stulz, C. F. Runyon, Julius Fay, Robert Capelle, G. W. Emmons, A. K. Andriano and William B. Pringle. Wires are to be placed by the company along every street in San Francisco.

ARCOLA, ILL.—The incorporators of the Aerial Transit & Telephone Company are Henry McCabe, Arcola, Ill.; T. L. Galbreath, Charleston, Ill., and Frank Osborne, of Pinesboro, Ill.

SUMNER, IOWA.—The entire property of the Sumner Telephone Company is now owned by E. A. Hurmence. The system is valued at $160,000, and it is the new owner's intention to greatly enlarge and improve the plant.

CASS CITY, MICH.—A bill has been passed by which the Cass City council is allowed to expend $3,500 for the purchase of a telephone plant. If more money is necessary bonds may be issued on vote of two-thirds of the people.

HIGGINSPORT, O.—The officers of the newly organized Higginsport Independent Telephone Company are: President of stockholders, Dr. Wesley Love; president of board of directors, Oscar C. Ellis; vice president, J. H. Neu; secretary, C. B. Williams; treasurer, M. H. Shinkle; manager, D. C. Warner.

SHERMAN, TEXAS.—The North Texas Telephone Co., of Sherman, Texas, has leased the property of the Phoenix Telephone Co., which owns an iron circuit toll line between Honey Grove and Sherman. It will string a No. 10 copper line, which will complete the copper circuit from Texarkana to Fort Worth and Dallas.

WEST, TEXAS.—The Home Telephone Co., of West and Abbot, Texas, is installing a large amount of new work since its reorganization, when J. B. Earle, of Waco, and his associates purchased a half interest in the property and Mr. Earle was made general manager.

FORT SASKATCHEWAN, ALB., CAN.—The long distance telephone line running from this city to Edmonton, formerly owned by the latter city, has been taken over by the provincial government, and will be rebuilt. Address S. Edwards, provincial telephone expert, Edmonton, Alb.

PERSONAL.

ROBERT BLACK has been promoted to the position of manager of the Home Telephone Company of Hattiesburg, Miss.

W. C. MOORE has been appointed manager of the Gainesboro Telephone Company's exchange at Somerset, Ky.

W. B. TOMPKINS has recently been made assistant managerof the Home Telephone Company at Quincy, Ill.

With the Builders

WALDRON, ARK.—A line from Waldron to Hon has been erected by the Waldron Telephone Company.

LOS ANGELES, CAL.—The Southern Telephone and Electric Company is considering the advisability of establishing long distance connections between Los Angeles and Bisbee, Ariz.

NEWARK, ILL.—It is the intention of the Farmers & Merchants Telephone Company to construct a number of new lines.

LA PORTE, IND.—A new exchange is being installed by the La Porte Telephone Company at Rolling Prairie.

MARTINSBURG, IND.—The line between Martinsburg and Pekin is being reconstructed by the Hoosier Telephone Company.

CHINA, ME.—The China Telephone Company is extending its lines into the eastern part of Kennebec county, and is also building a line between Weeks Mills and South China.

BAY CITY, MICH.—The Valley Telephone Company, which is to build a new exchange building at Saginaw, expects to erect a building for its own use in this city also.

JACKSON, MICH.—Among the improvements in its system being made by the Citizens' Telephone Company is the construction of a new toll line from Tompkins to Jackson.

DUNDAS, MINN.—The Dundas Rural Telephone Company is extending its system to Millersburg and points west of that city.

MONTEVIDEO, MINN.—It is the intention of the Citizens' Telephone Co. to build a new line to Hagan.

WASECA, MINN.—The plant of the Waseca Telephone Company is being enlarged.

LEWISTOWN, MONT.—It is the intention of the Lewistown-Billings Mutual Telephone Company to extend its lines from Moore to Harlowton. Later on the company expects to connect with Big Timber, greatly increasing its long distance connections.

CHERRY VALLEY, N. Y.—The lines of the Independent Telephone Company are being extended from Cherry Valley to Sharon Springs.

NORTH PERRY, N. Y.—The lines of the Forest Telegraph and Telephone Company between North Perry and Eastport are being rebuilt, and it is the intention of the company to rebuild its system between Eastport and Calais.

HOOSICK FALLS, N. Y.—Among the improvements planned by the Eastern New York Telephone & Telegraph Company is the building of a line through White Creek.

ELLENDALE, N. D.—A new exchange is to be installed at Ellendale by the Farmers' Telephone Company.

BOXELDER, TEXAS.—The Clarksville & Texarkana Telephone Company has established a new exchange at this city, and contemplates other improvements in its system.

EL PASO, TEXAS.—The Mountain Valley Mining & Telephone Company is building a telephone line from El Paso through the western part of Mexico down to the Guaynopa district and to Medera. It is its intention to establish local exchanges at Colonia Dublan and Nueva Casas Grandes.

SAN ANGELO, TEXAS.—Many improvements in the local telephone system at San Angelo, which is owned by Messrs. Rust Bros., are being made.

GILBERT, W. VA.—Lines from Gilbert to Christian are being constructed by the Gilbert Telephone Company.

REVELSTOKE, B. C., CAN.—The Revelstoke, Trout Lake and Big Bend Telephone Company is arranging for the construction of several long distance telephone lines. Address W. Cowan, manager, Revelstoke.

MORDEN, MAN., CAN.—The Louise Telephone Co. is planning for the erection of a long distance line from Crystal City to Snowflake, approximately eighteen miles.

WINNIPEG, MAN., CAN.—It is the intention of the Lac du Bois power plant to construct a telephone line from its plant to Winnipeg, a distance of seventy-five miles. Address C. B. Smith, Carnegie Library Building, Winnipeg, Man.

UNDERGROUND.

CAMDEN, N. J.—Permission has been granted to the Eastern Telephone & Telegraph Company to place its wires underground in certain streets in Camden.

The Independent Telegraph

The Natural Ally of the Independent Telephone

To all Interested in the Independent Telephone Movement:

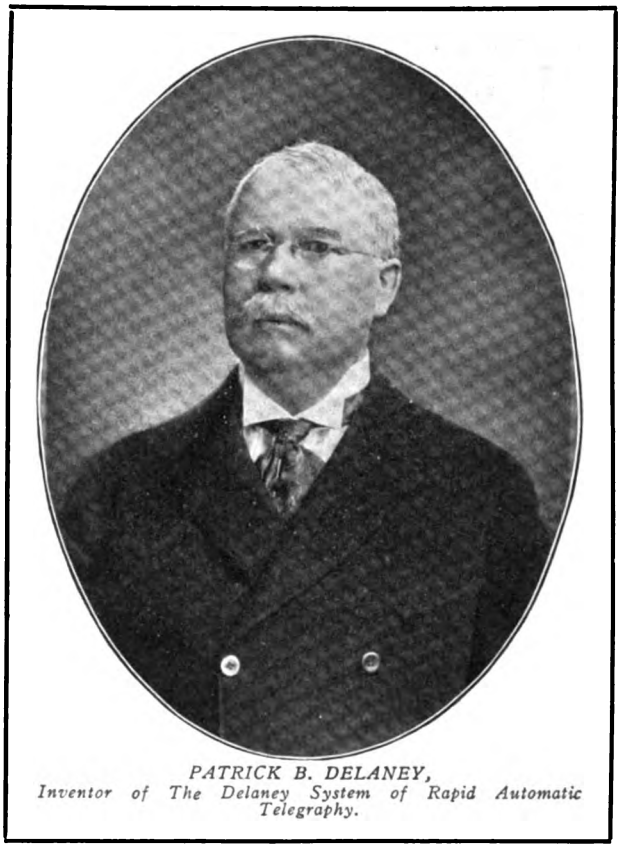
The Telepost Company, recently incorporated with a capital of $18,000,000, is rapidly organizing to give the American public what it sorely needs—cheap, quick telegraphy. By means of the only device that can utilize fully the carrying capacity of a wire—the Delany System of Rapid Automatic Telegraphy—the new and revolutionary telegraph will take its place with the telephone in the very forefront of public conveniences and necessities.

Long continued use and actual commercial work under all kinds of conditions have demonstrated conclusively that the Delany system is highly practical, thoroughly practicable and soundly commercial. Its economic energy is proved by the fact that it gets as great service from one wire as the Morse companies get from seventeen with the aid of the quadruplex, or from twenty-seven with the duplex, or from sixty-six when they have to depend upon the Morse simplex, as they do for 99 per cent of their service. The Delany system works undisturbed in all weathers, even when the other methods are completely out of commission.

The Telepost Company will carry the 50-word telepost or the 25-word telegram between any two of its offices for 25 cents. One price everywhere and anywhere in the United States.

The Delany system works over telephone circuits without the slightest interference with the latter form of service.

For the telephone companies not to get a profit from the telegraphic use of their wires would be shortsighted. To get any but the largest possible would be poor business. The Telepost Company can and will yield a larger return to the telephone companies than either of the telegraph companies could afford to give, or than the telephone companies themselves could earn by doing a telegraph business with any of the methods open to them.



PATRICK B. DELANEY,
Inventor of The Delaney System of Rapid Automatic Telegraphy.

Naturally, the Independents and the Telepost should have a close working union. The lines of the Independents should increase the wire mileage of the Telepost, and the big trunk lines of the Telepost should increase the long distance facilities of the Independents.

In order to make it impossible for any adverse interest to have anything whatever to do with the management of the Telepost, the voting power of the entire issue of stock has been placed in a voting trust, consisting of the following well-known men:

Hon. John W. Goff, New York, Judge of the Supreme Court; S. S. McClure, New York, editor and founder of *McClure's Magazine;* H. D. Critchfield, Milwaukee, Wis., president Milwaukee Independent Telephone Company; F. W. Shumaker, New York, treasurer Sterling Debenture Corporation; H. Lee Sellers, New York, secretary R. H. Sellers Company.

It will require the concurrent vote of all five to sell any of the rights, patents or other properties of the company. The Lincoln Trust Company, of New York City, acting as the agent of the above voting trust, will issue to the purchasers of stock its negotiable receipts, equivalent to the actual stock in every particular, excepting the right to vote.

The Board of Directors, as thus far made up, consists of:

Captain W. J. Barnette, U. S. N., Washington, D. C., General Board Navy Department; A. K. Brown, Chicago, Ill., president Kenwood Trust & Savings Bank, Chicago, Ill.; John M. Carrere, New York, Carrere & Hastings, Architects; Thomas Conyngton, New York, Conyngton & Harrison, Attorneys; H. D. Critchfield, Milwaukee, Wis., president Milwaukee Independent Telephone Company; R. H. Sellers, H. Lee Sellers, New York; C. H. Silliman, New York, founder Land Mortgage Bank of Texas, Ltd.; Hon. Wilson H. Fairbank, Warren, Mass., ex-Senator Massachusetts.

The Sterling Debenture Corporation, Brunswick Building, Madison Square, New York, whose officers are wide-awake men with reputations of long standing for the highest integrity and ability, are to co-operate with us and will have the exclusive handling of the shares offered for sale. They will furnish sufficient funds to build an installation that will put the Telepost Company on a paying basis from the start and lead to its rapid extension.

We feel that it is due to the Telepost, to you and to ourselves, that we lay our plans first before you. In our arrangements with the Sterling Debenture Corporation we stipulated that no stock should be offered to their customers until we had reached as many as possible of the officers and shareholders of the Independents and given them an opportunity to secure as much of the Telepost as they cared to own.

This is not, however, in any sense a solicitation to you to buy stock of the Telepost Company. Every share the Sterling Debenture Corporation offers for sale will find a ready purchaser among their many customers; but we tell you frankly that we hope every available share offered will be taken by the Independents, and that you and we shall own the Telepost.

Our object in this announcement is simply to lay everything before you, as is due you, considering our many mutual interests and possibilities, so that no one can ever say that we had passed over members of the same family and made the first offer to strangers.

Mr. Delany's and our long desired plan of giving to and preserving for the American public a telegraph service worthy the name and the nation is now to be consummated, and we are seeking to make our first announcements to you, our allies, in the Independent field.

We shall be pleased to send you a prospectus upon application.

Yours very truly,

R. H. SELLERS COMPANY,
225 Fifth avenue, New York City.
